Intel® C++ Compiler 19.0 Developer Guide and Reference............................... 36

Part I: Introducing the Intel®C++ Compiler
Feature Requirements ...................................................................................... 38
Getting Help and Support ............................................................................ 39
Related Information ..................................................................................... 40
Notational Conventions ............................................................................... 40

Part II: Compiler Setup
Using the Command Line............................................................................. 43
  Specifying the Location of Compiler Components with compilervars........ 43
  Invoking the Intel® Compiler .................................................................... 45
  Using the Command Line on Windows* .................................................... 47
Using Makefiles to Compile Your Application ......................................... 49
Using Compiler Options .......................................................................... 49
Specifying Include Files ......................................................................... 52
Specifying Object Files .................................................................... 53
Specifying Assembly Files .................................................................. 53
Converting Projects to Use a Selected Compiler from the Command Line ...................................................................................... 54
Using Eclipse* (Linux*) ............................................................................. 54
  Adding the Compiler to Eclipse* .......................................................... 55
  Multi-Version Compiler Support ......................................................... 55
  Using Cheat Sheets ............................................................................. 55
Creating a Simple Project ........................................................................ 56
  Creating a New Project ..................................................................... 56
  Adding a C Source File ................................................................. 57
  Setting Options for a Project or File .................................................. 57
  Excluding Source Files from a Build ................................................. 58
  Building a Project ........................................................................ 58
  Running a Project ........................................................................ 58
  Intel® C/C++ Error Parser ...................................................... 58
Make Files.................................................................................................. 59
  Project Types and Makefiles ............................................................ 59
  Exporting Makefiles .................................................................... 59
Using Intel® Performance Libraries with Eclipse* .................................... 60
Using Microsoft Visual Studio* (Windows*) .............................................. 61
  Creating a New Project ................................................................ 61
  Using the Intel® C++ Compiler ......................................................... 62
  Building Your Intel® C++ Project ..................................................... 63
Selecting the Compiler Version ................................................................ 64
  Switching Back to the Visual C++* Compiler .................................... 64
Selecting a Configuration ...................................................................... 64
  Specifying a Target Platform ......................................................... 65
  Specifying Directory Paths ............................................................. 65
  Specifying a Base Platform Toolset with the Intel® C++ Compiler ... 65
Using Property Pages.............................................................................. 66
Code Generation Options ....................................................... 145
arch............................................................................ 145
ax, Qax ....................................................................... 147
EH .............................................................................. 150
fasynchronous-unwind-tables ......................................... 151
fexceptions .................................................................. 152
fomit-frame-pointer, Oy................................................. 153
Gd.............................................................................. 154
Gr .............................................................................. 155
GR.............................................................................. 155
guard ........................................................................... 156
Gv .............................................................................. 157
Gz .............................................................................. 158
hotpatch...................................................................... 158

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512)
Instructions............................................................................. 1112
Overview: Intrinsics for Intel® Advanced Vector Extensions 512
(Intel® AVX-512) Instructions ............................................ 1112
Intrinsics for Arithmetic Operations ...................................... 1115
Intrinsics for Addition Operations ................................... 1115
Intrinsics for Determining Minimum and Maximum Values .1120
Intrinsics for FP Fused Multiply-Add (FMA) Operations...... 1124
Intrinsics for Multiplication Operations .............................. 1158
Intrinsics for Subtraction Operations .................................... 1164
Intrinsics for Short Vector Math Library (SVML) Operations1170
Intrinsics for Other Mathematics Operations .................... 1209
Intrinsics for Blend Operations............................................... 1222
Intrinsics for Bit Manipulation Operations .............................. 1223
Intrinsics for Integer Bit Manipulation and Conflict
Detection Operations......................................................... 1223
Intrinsics for Bitwise Logical Operations ............................... 1226
Intrinsics for Integer Bit Rotation Operations .................. 1230
Intrinsics for Integer Bit Shift Operations .......................... 1233
Intrinsics for Broadcast Operations ...................................... 1242
Intrinsics for FP Broadcast Operations ................................ 1242
Intrinsics for Integer Broadcast Operations .......................... 1244
Intrinsics for Comparison Operations ................................... 1247
Intrinsics for FP Comparison Operations............................. 1247
Intrinsics for Integer Comparison Operations...................1257
Intrinsics for Compression Operations.................................1266
Intrinsics for Conversion Operations ...................................1268
Intrinsics for FP Conversion Operations..........................1269
Intrinsics for Integer Conversion Operations....................1286
Intrinsics for Expand and Load Operations........................1313
Intrinsics for FP Expand and Load Operations ....................1313
Intrinsics for Integer Expand and Load Operations ............1315
Intrinsics for Gather and Scatter Operations ......................1317
Intrinsics for FP Gather and Scatter Operations .................1317
Intrinsics for Integer Gather and Scatter Operations ...........1324
Intrinsics for Insert and Extract Operations ........................1327
Intrinsics for FP Insert and Extract Operations .................1327
Intrinsics for Integer Insert and Extract Operations ..........1335
Intrinsics for Load and Store Operations................................1337
Intrinsics for FP Loads and Store Operations ......................1337
Intrinsics for Integer Load and Store Operations ...............1342
Intrinsics for Miscellaneous Operations............................1346
Intrinsics for Miscellaneous FP Operations .......................1346
Intrinsics for Miscellaneous Integer Operations ................1355
Intrinsics for Move Operations ...........................................1356
Intrinsics for FP Move Operations.....................................1356
Intrinsics for Integer Move Operations .............................1359
Intrinsics for Pack and Unpack Operations ............................1360
Intrinsics for FP Pack and Unpack Operations ..................1360
Intrinsics for Integer Pack and Unpack Operations ...........1362
Intrinsics for Permutation Operations................................1365
Intrinsics for FP Permutation Operations .........................1365
Intrinsics for Integer Permutation Operations ....................1369
Intrinsics for Reduction Operations ....................................1373
Intrinsics for FP Reduction Operations ..............................1373
Intrinsics for Integer Reduction Operations ......................1376
Intrinsics for Set Operations .............................................1381
Intrinsics for Shuffle Operations ........................................1388
Intrinsics for FP Shuffle Operations ..................................1388
Intrinsics for Integer Shuffle Operations ..........................1390
Intrinsics for Test Operations ............................................1392
Intrinsics for Typecast Operations .....................................1395
Intrinsics for Vector Mask Operations ................................1398
Intrinsics for Later Generation Intel® Core™ Processor Instruction
Extensions ..............................................................................1400
Overview: Intrinsics for 3rd Generation Intel® Core™ Processor
Instruction Extensions ......................................................1400
Overview: Intrinsics for 4th Generation Intel® Core™ Processor
Instruction Extensions ......................................................1400
Intrinsics for Converting Half Floats that Map to 3rd Generation
Intel® Core™ Processor Instructions....................................1401
_mm_cvtph_ps() .............................................................1401
_mm256_cvtph_ps() ....................................................1402
_mm_cvtps_ph() ...........................................................1402
_mm256_cvtps_ph() ....................................................1402
Intrinsics that Generate Random Numbers of 16/32/64 Bit Wide
Random Integers ..........................................................1403
_rdrand16_step(), _rdrand32_step(), _rdrand64_step() ......1403
_rdseed16_step/, _rdseed32_step/, _rdseed64_step...........1404
Intrinsics for Multi-Precision Arithmetic .............................................................. 1404
  _addcarry_u32(), _addcarry_u64() ................................................................. 1404
  _addcarryx_u32(), _addcarryx_u64() ............................................................ 1405
  _subborrow_u32(), _subborrow_u64() ............................................................... 1406
Intrinsics that Allow Reading from and Writing to the FS Base
  and GS Base Registers.......................................................................................... 1407
  _readfsbase_u32(), _readfsbase_u64() ............................................................ 1407
  _readgsbase_u32(), _readgsbase_u64() ............................................................ 1407

### Intrinsics for Compare Operations

- `_mm256_cmpeq_epi8/16/32/64`
- `_mm256_cmpgt_epi8/16/32/64`
- `_mm256_max_epi8/16/32`
- `_mm256_min_epi8/16/32`

### Intrinsics for Fused Multiply Add Operations

- `_mm_fmadd_pd, _mm256_fmadd_pd`
- `_mm_fmadd_ps, _mm256_fmadd_ps`
- `_mm_fmadd_sd`
- `_mm_fmadd_ss`
- `_mm_fmaddsub_pd, _mm256_fmaddsub_pd`
- `_mm_fmaddsub_ps, _mm256_fmaddsub_ps`
- `_mm_fmsub_pd, _mm256_fmsub_pd`
- `_mm_fmsub_ps, _mm256_fmsub_ps`
- `_mm_fmsub_sd`
- `_mm_fmsub_ss`

### Intrinsics for GATHER Operations

- `_mm_mask_i32gather_pd, _mm256_mask_i32gather_pd`
- `_mm_i32gather_pd, _mm256_i32gather_pd`
- `_mm_mask_i64gather_pd, _mm256_mask_i64gather_pd`
- `_mm_i64gather_pd, _mm256_i64gather_pd`
- `_mm_mask_i32gather_ps, _mm256_mask_i32gather_ps`
- `_mm_i32gather_ps, _mm256_i32gather_ps`
- `_mm_mask_i64gather_ps, _mm256_mask_i64gather_ps`
- `_mm_i64gather_ps, _mm256_i64gather_ps`
- `_mm_mask_i32gather_epi32, _mm256_mask_i32gather_epi32`
- `_mm_i32gather_epi32, _mm256_i32gather_epi32`
- `_mm_mask_i32gather_epi64, _mm256_mask_i32gather_epi64`
- `_mm_i32gather_epi64, _mm256_i32gather_epi64`
- `_mm_mask_i64gather_epi32, _mm256_mask_i64gather_epi32`
- `_mm_i64gather_epi32, _mm256_i64gather_epi32`
- `_mm_mask_i64gather_epi64, _mm256_mask_i64gather_epi64`
- `_mm_i64gather_epi64, _mm256_i64gather_epi64`

Use the Intel® C++ Compiler to compile and generate applications. The following are some important features of the compiler:

**Older Versions and Context Sensitive/F1 Help**
To use the Context Sensitive/F1 Help feature, visit the Download Documentation: Intel® Compiler (Current and Previous) page and follow the instructions provided there. You can also use this download to access the current and previous versions on your local machine.

**Compiler Setup**
Compiler Setup explains how to invoke the compiler on the command line or from within an IDE.

**OpenMP® Support**
The compiler supports many OpenMP® features, including most of OpenMP® Version TR4: Version 5.0.

**Intel® Many Integrated Core Architecture**
The Intel compiler supports elements that enable programming for and building binaries to run on the Intel® Many Integrated Core Architecture (Intel® MIC Architecture).

The Intel® Xeon Phi™ processors are based on the Intel® Many Integrated Core architecture (Intel® MIC architecture).

**Compiler Options**
Compiler Options provides information about options you can use to affect optimization, code generation, and more.

**Intrinsics**
Intrinsics let you generate more readable code, simplify instruction scheduling, reduce debugging, access the instructions that cannot be generated using the standard constructs of the C and C++ languages, and more.

**Pragmas**
Pragmas provide the compiler with the instructions for specific tasks, such as splitting large loops into smaller ones, enabling or disabling optimization for code, or offloading computation to the target.
Introducing the Intel® C++ Compiler

Using the Intel® C++ Compiler, you can compile and generate applications that can run on Intel® 64 architecture. You can also create programs for the IA-32 architecture on Windows* and Linux*.

Intel® 64 architecture applications can run on the following:
• Windows* operating systems for Intel® 64 architecture-based systems.
• Linux* operating systems for Intel® 64 architecture-based systems.
• macOS* operating systems for Intel® 64 architecture-based systems.

IA-32 architecture applications can run on the following:
• Supported Windows* operating systems
• Supported Linux* operating systems

NOTE
Starting with the 19.0 release of the Intel® C++ Compiler, macOS* 32-bit applications are no longer supported. If you want to compile 32-bit applications, you must use an earlier version of the compiler and you must use Xcode* 9.4 or earlier.

Applications that run on Intel® Many Integrated Core Architecture (Intel® MIC Architecture) can be built on supported Windows* and Linux* operating systems. However, these applications can run only on Intel® 64 architecture-based systems targeting Intel® MIC Architecture.

Some information that applies to Intel® 64 architecture may also apply to Intel® Many Integrated Core Architecture (Intel® MIC Architecture).

Intel® Xeon Phi™ products are based on Intel® Many Integrated Core Architecture (Intel® MIC Architecture).

Unless specified otherwise, assume the information in this document applies to all supported architectures and all operating systems.

You can use the compiler in the command-line or in a supported Integrated Development Environment (IDE):
• Microsoft Visual Studio* (Windows* only)
• Eclipse*/CDT (Linux* only)
• Xcode* (macOS* only)

See the Release Notes for complete information on supported architectures, operating systems, and IDEs for this release.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804
Feature Requirements

To use these tools and features, you need licensed versions of the tools and you must have an appropriately supported version of the product edition. For more information, check the product release notes.

NOTE Some features may require additional product installation.

The following table shows components (tools) and where to find additional information on them.

<table>
<thead>
<tr>
<th>Component</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intel® VTune™ Amplifier</td>
<td>More information on tools and features can be found on the Intel® Developer Zone (Intel® IDZ): <a href="http://software.intel.com/">http://software.intel.com/</a></td>
</tr>
<tr>
<td>Intel® Inspector</td>
<td>More information on tools and features can be found on the Intel IDZ: <a href="http://software.intel.com/">http://software.intel.com/</a></td>
</tr>
<tr>
<td>Intel® Trace Analyzer and Collector</td>
<td></td>
</tr>
</tbody>
</table>

The following table lists dependent features and their corresponding required products. For certain compiler options, the compilation may fail if the option is specified but the required product is not installed. In this case, remove the option from the command line and recompile. For more information about requirements for a particular product, see http://www.intel.com/software/products/.

**Feature Requirements**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thread Checking</td>
<td>Intel® Inspector</td>
</tr>
<tr>
<td>Trace Analyzing and Collecting</td>
<td>Intel® Trace Analyzer and Collector</td>
</tr>
<tr>
<td></td>
<td>Compiler options related to this feature may require a set-up script. For further information, see the product documentation.</td>
</tr>
<tr>
<td>Pointer Checker</td>
<td>Intel® Parallel Studio XE Professional Edition or Intel® Parallel Studio XE Cluster Edition</td>
</tr>
</tbody>
</table>

NOTE If a Pointer Checker option supports Intel® Memory Protection Extensions (Intel® MPX), then the target for the product must also support Intel® MPX.

**Other Tools**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privatization of static data for the MultiProcessor Computing (MPC) unified parallel runtime</td>
<td>MPC framework elements</td>

</tr>
</tbody>
</table>

Refer to the Release Notes for detailed information about system requirements, late changes to the products, supported architectures, operating systems, and Integrated Development Environments (IDEs).
Getting Help and Support

Windows*
Documentation is available from within the version of Microsoft Visual Studio* installed on your system. From the Help menu, choose Intel Compilers and Libraries to view the installed user and reference documentation.

Linux* and macOS*
On both Linux* and macOS*, the documentation has limited integration in the Eclipse*/CDT and Xcode*. In both cases, the integrated documentation only provides details about where to find the product documentation on your local system.

Intel Software Documentation
You can find product documentation for many released products at: http://software.intel.com/en-us/intel-software-technical-documentation/

Product Website and Support
To find product information, register your product, or contact Intel, visit: https://software.intel.com/en-us/support/
At this site, you will find comprehensive product information, including:
- Links to Get Started, Documentation, Individual Support, and Registration
- Links to information such as white papers, articles, and user forums
- Links to product information
- Links to news and events

Online Service Center
Each purchase of an Intel® Software Development Product includes a year of support services, which includes priority customer support at our Online Service Center. For more information about the Online Service Center visit: https://software.intel.com/en-us/support/online-service-center

**NOTE** To access support, you must register your product at the Intel® Registration Center: https://registrationcenter.intel.com

Release Notes
For detailed information on system requirements, late changes to the products, supported architectures, operating systems, and Integrated Development Environments (IDE) see the Release Notes for the product.

Forums
You can find helpful information in the Intel Software user forums. You can also submit questions to the forums. To see the list of the available forums, go to https://software.intel.com/en-us/forum/
Related Information

Recommended Additional Reading
You are strongly encouraged to read the following books for in-depth understanding of threading. Each book discusses general concepts of parallel programming by explaining a particular programming technology:

• For information on OpenMP* technology: Chapman, Barbara, Gabriele Jost, Ruud van der Pas, and David J. Kuck (foreword). Using OpenMP: Portable Shared Memory Parallel Programming. MIT Press, October 2007
• For information on Microsoft Win32* Threading (for Windows* users): Akhter, Shameem, and Jason Roberts. Multi-Core Programming: Increasing Performance through Software Multithreading, Intel Press, April 2006

Intel does not endorse these books or recommend them over other books on the same subjects.

Additional Product Information
For additional technical product information including white papers, forums, and documentation, visit https://software.intel.com/en-us/intel-sdp-home/

Additional Language Information
• For information about the C++ standards, visit the C++ website: http://www.isocpp.org/
• For information about the C standards, visit the C website: http://www.open-std.org/jtc1/sc22/wg14/
• For information about the OpenMP* standards, visit the OpenMP website: http://www.openmp.org/

Notational Conventions

Information in this documentation applies to all supported operating systems and architectures unless otherwise specified. This documentation uses the following conventions:

Notational Conventions

| THIS TYPE | Indicates language keywords. |
| this type | Indicates command-line or option arguments. |
| This type | Indicates a code example. |
| This type | Indicates what you type as input. |
| This type | Indicates menu names, menu items, button names, dialog window names, and other user-interface items. |
| File > Open | Menu names and menu items joined by a greater than (>) sign to indicate a sequence of actions. For example, Click File > Open indicates that in the File menu, you would click Open to perform this action. |
{value | value} Indicates a choice of items or values. You can usually only choose one of the values in the braces.

[item] Indicates items that are optional.

item [, item ]... Indicates that the item preceding the ellipsis (...) can be repeated.

Intel® C++ This term refers to the name of the common compiler language supported by the Intel® C++ Compiler.

Windows* or Windows* operating system These terms refer to all supported Microsoft Windows* operating systems.

Linux* or Linux* operating system These terms refer to all supported Linux* operating systems.

macOS* or macOS* operating system These terms refer to all supported macOS* operating systems.

Microsoft Visual Studio* An asterisk at the end of a word or name indicates it is a third-party product trademark.

compiler option This term refers to Linux*, macOS*, or Windows* options, which are used by the compiler to compile applications.

The following conventions are used as shortcuts when referencing compiler option names in text:

• Many options have names that are the same on Linux*, macOS*, and Windows*, except that the Windows* form starts with an initial / and the Linux* and macOS* form starts with an initial -. Within text, such option names are shown without the initial character. For example, check.

• Many options have names that are the same on Linux*, macOS*, and Windows*, except that the Windows* form starts with an initial Q. Within text, such option names are shown as [Q]option-name.

For example, if you see a reference to [Q]ip, the Linux* and macOS* form of the option is -ip and the Windows* form of the option is /Qip.

• Several compiler options have similar names except that the Linux* and macOS* forms start with an initial q and the Windows* form starts with an initial Q. Within text, such option names are shown as [q or Q]option-name.

For example, if you see a reference to [q or Q]opt-report, the Linux* and macOS* form of the option is -qopt-report and the Windows* form of the option is /Qopt-report.
Other dissimilar compiler option names are shown in full.

### Conventions Used in Compiler Options

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| `/option` | A slash before an option name indicates the option is available on Windows*. A dash before an option name indicates the option is available on Linux* and macOS* systems. For example:  
- Windows* option: `/fast`
- Linux* and macOS* option: `-fast`

| /option:argument | Indicates that an option requires an argument (parameter). For example, you must specify an argument for the following options:  
- Windows* option: `/Qdiag-error-limit:n`
- Linux* and macOS* option: `-diag-error-limit=n`

| /option:keyword | Indicates that an option requires one of the keyword values. |
| -option=keyword | |

| /option[:keyword] | Indicates that the option can be used alone or with an optional keyword. |
| -option=[keyword] | |

| option[n] | Indicates that the option can be used alone or with an optional value. For example, in `/Qfnalign[:n]` and `-falign-functions=[n]`, the `n` can be omitted or a valid value can be specified for `n`. |
| option[:n] |  
| option[=n] |  

| option[-] | Indicates that a trailing hyphen disables the option. For example, `/Qglobal_hoist-` disables the Windows* option `/Qglobal_hoist`.

| [no]option | Indicates that `no` or `no-` preceding an option disables the option. For example, in the Windows* option `/[no]traceback`, `/traceback` enables the option, while `/notraceback` disables it. |
| [no-]option | In the Linux* and macOS* option `-[no-]global_hoist`, `-global_hoist` enables the option, while `-no-global_hoist` disables it.

| In some options, the `no` appears later in the option name. For example, `-fno-alias` disables the `-falias` option. |
You can use the Intel® C++ Compiler from the command line, or from the IDEs listed below. These IDEs are described in further detail in their corresponding sections.

Using the Command Line

Specifying the Location of Compiler Components with compilervars

Before you invoke the compiler, you may need to set certain environment variables that define the location of compiler-related components.

The Intel® C++ Compiler includes compilervars scripts to set environment variables:

- On Linux* and macOS*, the file is a shell script called compilervars.sh or compilervars.csh.
- On Windows*, the file is a batch file called compilervars.bat. The batch file iclvars.bat is provided for compatibility.

The following information is operating system dependent.

**NOTE** IA-32 architecture is no longer supported on macOS*.

**Linux* and macOS***:

Set the environment variables before using the compiler by sourcing the shell script compilervars.sh or compilervars.csh. Depending on the shell, you can use the source command or a . (dot) to source the shell script, according to the following rules:

- **.csh script**: Use the source command.
- **.sh script**:
  - Bash: Use either the source command or . (dot space).
  - Dash or other POSIX-compliant shell: Use . (dot space).

```bash
// Bash shell:
source /<install-dir>/bin/compilervars.sh <arg>
./<install-dir>/bin/compilervars.sh <arg>

// examples: (assuming <install-dir> is /installed/compiler/)
prompt> source /installed/compiler/bin/compilervars.sh ia32
prompt> ./installed/compiler/bin/compilervars.sh ia32

// OR//
// C shell:
source /<install-dir>/bin/compilervars.csh <arg>
```
The environment script file requires a target architecture argument <arg>:

- **ia32**: Compiler and libraries for IA-32 architecture-based targets only.
- **intel64**: Compiler and libraries for Intel® 64 architecture-based targets only.

If you want the script to run automatically, add the same command to the end of your startup file.

For example, a `.bash_profile` entry for `compilervars.sh` for IA-32 architecture targets only:

```
# set environment vars for Intel(R) C++ Compiler
source <install-dir>/bin/compilervars.sh ia32
```

## NOTE
Symbolic links are created in the `/opt/intel` directory at install. The environment variables use symbolic links. When two versions of the Intel® C++ Compiler are installed, the newest installed version is symbolically linked.

## NOTE
With some Linux* distributions, if the Intel® C++ Compiler (`icpc`) is sourced using `compilervars.sh` from the `.bash_profile`, the location of `LIBRARY_PATH` may not be set as expected. It may be necessary to source `compilervars.sh` after starting a terminal session.

If the proper environment variables are not set, an error similar to the following appears when attempting to execute a compiled program:

```
./a.out: error while loading shared libraries:
libimf.so: cannot open shared object file: No such file or directory
```

### Windows*

Under normal circumstances, you do not need to run the `compilervars.bat` batch file. The Intel® C++ command line sets these variables automatically.

For information on using the command line see *Using the Command Line on Windows*.

## NOTE
You need to run the batch file if a command line is opened without using one of the provided menu items in the Start menu, or if you want to use the compiler from a script of your own.

The batch file inserts the directories used by the Intel® C++ Compiler at the beginning of the existing paths. Because these directories appear first, they are searched before the directories in the path lists that are provided by Windows*. This is especially important if the existing path includes directories with files that have the same names as those needed by the Intel® C++ Compiler.

If needed, you can run `compilervars.bat` each time you begin a session on Windows* systems by specifying it as the initialization file with the PIF Editor.
The batch file takes two arguments:

\<install-dir>\bin\compilervars.bat <arg1> [<arg2>]

Where <arg1> is one of the following:

- intel64: Compiler and libraries for Intel® 64 architecture only (host and target).
- ia32: Compiler and libraries for IA-32 architecture only (host and target).

The <arg2> is optional. If specified, it is one of the following:

- vs2017: Microsoft Visual Studio* 2017
- vs2015: Microsoft Visual Studio* 2015
- vs2013: Microsoft Visual Studio* 2013

**NOTE** If <arg2> is not specified, the script uses the version of Microsoft Visual Studio* detected during the installation procedure.

## Invoking the Intel® Compiler

### Requirements before Using the Command Line

You may need to set certain environment variables before using the command line. For more information, see Specifying the Location of Compiler Components with compilervars.

**macOS***: Alternatively, you can invoke the compiler with the commands described below using symbolic links in `~/usr/local/bin`.

### Using the Intel® C++ Compiler from the Command Line

You can invoke the compiler using the `icc` or `icpc` command.

**NOTE** You can also use the compiler from within the IDE. For more information on using Microsoft Visual Studio*, see Using Microsoft Visual Studio*. For information on using Xcode*, see Using Xcode*. For information on using Eclipse*, see Using Eclipse*.

**Linux***:

Invoke the compiler using `icc/icpc` to compile C/C++ source files.

- When you invoke the compiler with `icc`, the compiler builds C source files using C libraries and C include files. If you use `icc` with a C++ source file, it is compiled as a C++ file. Use `icc` to link C object files.
- When you invoke the compiler with `icpc` the compiler builds C++ source files using C++ libraries and C++ include files. If you use `icpc` with a C source file, it is compiled as a C++ file. Use `icpc` to link C++ object files.

The `icc/icpc` command does the following:

- Compiles and links the input source file(s).
- Produces one executable file, `a.out`, in the current directory.

**macOS***:

Invoke the compiler using `icc/icpc` to compile C/C++ source files.

- When you invoke the compiler with `icc`, the compiler builds C source files using C libraries and C include files. If you use `icc` with a C++ source file, it is compiled as a C++ file. Use `icc` to link C object files.
When you invoke the compiler with `icpc` the compiler builds C++ source files using C++ libraries and C++ include files (libc++ library is used by default). If you use `icpc` with a C source file, it is compiled as a C++ file. Use `icpc` to link C++ object files.

The `icc/icpc` command does the following:

- Compiles and links the input source file(s).
- Produces one executable file, `a.out`, in the current directory.

**Windows***:

You can invoke the Intel® C++ Compiler on the command line using the `icl` command. This command:

- Compiles and links the input source file(s).
- Produces object file(s) and assigns the names of the respective source file(s), but with a `.obj` extension.
- Produces one executable file and assigns to it the name of the first input file on the command line, but with a `.exe` extension.
- Places all the files in the current directory.

Because the driver calls other software components, they may return error messages. For instance, the linker may return a message if it cannot resolve a global reference. The `watch` option can help clarify which component is generating the error.

**Command Line Syntax**

When you invoke the Intel® C++ Compiler, the syntax is:

```plaintext
// (Linux*)
{icc|icpc} [options] file1 [file2 ...]

// (macOS*)
{icc|icpc} [options] file1 [file2 ...]

// (Windows*)
icl [options] file1 [file2 ...][/link link_options]
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>options</code></td>
<td>Indicates one or more command line options. On Linux* and macOS* systems, the compiler recognizes one or more letters preceded by a hyphen (<code>-</code>). On Windows*, options are preceded by a slash (<code>/</code>). This includes linker options. Options are not required when invoking the compiler. The default behavior of the compiler implies that some options are ON by default when invoking compiler.</td>
</tr>
<tr>
<td><code>file1</code>, <code>file2 ...</code></td>
<td>Indicates one or more files to be processed by the compiler. You can specify more than one file, using space as a delimiter for multiple files.</td>
</tr>
<tr>
<td><code>/link</code> (Windows*)</td>
<td>All options following <code>/link</code> are passed to the linker. Compiler options must precede <code>link</code> if they are not to be passed to the linker.</td>
</tr>
</tbody>
</table>

**NOTE** The compiler recognizes Language Extensions for Offloading in the source program by default and builds a heterogeneous binary that runs on both the target and host when any are present. If your program includes these language extensions and you do not want to build a heterogeneous binary, specify the negative form of the `-qoffload` (Linux*) or `/Qoffload` (Windows*) compiler option. For more information, see Heterogeneous Programming and the `qoffload`, `Qoffload` compiler option.
Other Methods for Using the Command Line to Invoke the Compiler

- **Using makefiles from the Command Line:** Use makefiles to specify a number of files with various paths and to save this information for multiple compilations. For more information on using makefiles, see Using Makefiles to Compile Your Application.

- **Using a Batch File from the Command Line:** Use a .bat file to consistently execute the compiler with a desired set of options instead of retyping the command each time you need to recompile.

**See Also**
Using the compilervars File to Specify Location of Components
Understanding File Extensions
Using Makefiles to Compile Your Application
watch
qoffload, Qoffload
Heterogeneous Programming

**Using the Command Line on Windows***

The compiler provides a shortcut to access the command line with the appropriate environment variables already set.

To invoke the compiler from the command line:

- **Windows* 10:**
  1. From the **Start** screen, swipe up from the bottom edge, or click the arrow to move the **Apps** screen.
  2. In the **Apps** screen, scroll to the right until you see the program group for your Intel product.
  3. Click **Intel 64 Visual Studio mode** or **IA-32 Visual Studio mode** to open a command window on your desktop.

- **Older Windows* Versions:**
  Click the appropriate mode from the **Start** menu item for your Intel product under **All Programs > the product > Compiler and Performance Libraries > Command Prompt with Intel Compiler**.

The command line opens.

You can use any command recognized by the Windows* command prompt, plus some additional commands.

Because the command line runs within the context of Windows*, you can easily switch between the command line and other applications for Windows* or have multiple instances of the command line open simultaneously.

When you are finished working in a command line, use the exit command to close and end the session.

**Understanding File Extensions**

**Input File Extensions**
The Intel® C++ Compiler recognizes input files with the extensions listed in the following table:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Interpretation</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>file.c</td>
<td>C source file</td>
<td>Passed to compiler</td>
</tr>
<tr>
<td>file.C</td>
<td>C++ source file</td>
<td>Passed to compiler</td>
</tr>
<tr>
<td>file.CC</td>
<td></td>
<td></td>
</tr>
<tr>
<td>file.cc</td>
<td></td>
<td></td>
</tr>
<tr>
<td>file.cpp</td>
<td></td>
<td></td>
</tr>
<tr>
<td>File Name</td>
<td>Interpretation</td>
<td>Action</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>file.cxx</td>
<td></td>
<td></td>
</tr>
<tr>
<td>file.lib</td>
<td>Library file</td>
<td>Passed to linker</td>
</tr>
<tr>
<td>file.a</td>
<td></td>
<td></td>
</tr>
<tr>
<td>file.so</td>
<td>(Linux* and macOS*)</td>
<td></td>
</tr>
<tr>
<td>file.dylib</td>
<td>(macOS*)</td>
<td></td>
</tr>
<tr>
<td>file.i</td>
<td>Preprocessed file</td>
<td>Passed to compiler</td>
</tr>
<tr>
<td>file.obj</td>
<td>Object file</td>
<td>Passed to linker</td>
</tr>
<tr>
<td>file.o</td>
<td>(Linux* and macOS*)</td>
<td></td>
</tr>
<tr>
<td>file.asm</td>
<td>Assembly file</td>
<td>Passed to assembler</td>
</tr>
<tr>
<td>file.s</td>
<td>(Linux* and macOS*)</td>
<td></td>
</tr>
<tr>
<td>file.S</td>
<td>(Linux* and macOS*)</td>
<td></td>
</tr>
</tbody>
</table>

### Output File Extensions

The Intel® C++ Compiler produces output files with the extensions listed in the following table:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file.i</td>
<td>Preprocessed file: Produced with the -P option.</td>
</tr>
<tr>
<td>file.o</td>
<td>Object file: Produced with the -c (Linux*, macOS*, and Windows*) object.</td>
</tr>
<tr>
<td></td>
<td>The /Fo (Windows*) option allows you to rename the output object file.</td>
</tr>
<tr>
<td>file.asm</td>
<td>Assembly language file: Produced with the -S option. The /Fa (Windows*)</td>
</tr>
<tr>
<td></td>
<td>option allows you to rename the output assembly file.</td>
</tr>
<tr>
<td>a.out</td>
<td>Executable file: Produced by the default compilation.</td>
</tr>
<tr>
<td>file.exe</td>
<td>(Linux* and macOS*)</td>
</tr>
</tbody>
</table>

Invoking the Intel® C++ Compiler
Using Makefiles to Compile Your Application

This topic describes the use of makefiles to compile your application. You can use makefiles to specify a number of files with various paths, and to save this information for multiple compilations.

Using Makefiles to Store Information for Compilation on Linux* or macOS*

To run `make` from the command line using the Intel® C++ Compiler, make sure that `/usr/bin` and `/usr/local/bin` are in your `PATH` environment variable.

If you use the C shell, you can edit your `.cshrc` file and add the following:

```
setenv PATH /usr/bin:/usr/local/bin:$PATH
```

To use the Intel® C++ Compiler, your makefile must include the setting `CC=icpc`. Use the same setting on the command line to instruct the makefile to use the Intel® C++ Compiler. If your makefile is written for GCC*, the GNU* C compiler, you need to change the command line options that are not recognized by the Intel® C++ Compiler. Run `make`, using the following syntax:

```
make -f yourmakefile
```

Where `-f` is the `make` command option to specify a particular makefile name.

Using Makefiles to Store Information for Compilation on Windows*

To use a makefile to compile your source files, use the `nmake` command with the following syntax:

```
nmake /f [makefile_name.mak] CPP=[compiler_name.exe] [LINK32=[linker_name.exe]]
```

For example:

```
prompt> nmake /f your_project.mak CPP=icl.exe LINK32=xilink.exe
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/f</code></td>
<td>The <code>nmake</code> option to specify a makefile.</td>
</tr>
<tr>
<td>your_project.mak</td>
<td>The makefile used to generate object and executable files.</td>
</tr>
<tr>
<td>CPP</td>
<td>The preprocessor/compiler that generates object and executable files. (The name of this macro may be different for your makefile.)</td>
</tr>
<tr>
<td>LINK32</td>
<td>The linker that is used.</td>
</tr>
</tbody>
</table>

The `nmake` command creates object files (.obj) and executable files (.exe) from the information specified in the `your_project.mak` makefile.

- Modifying Your makefile (Windows*)

Using Compiler Options

A compiler option is a case-sensitive, command line expression used to change the compiler's default operation. Compiler options are not required to compile your program, but they can control different aspects of your application, such as:
- Code generation
- Optimization
- Output file (type, name, location)
- Linking properties
- Size of the executable
- Speed of the executable

See the Option Categories section for the option capabilities included with the Intel® C++ Compiler.

**Command Line Syntax (Linux* and macOS*)**

When you specify compiler options on the command line, the following syntax applies:

```
icc [options] [@response_file] file1 [file2...]            //Linux* and macOS*
```

The `options` represents zero or more compiler options and the `file` is any of the following:

- C or C++ source file (`.c`, `.c`, `.cc`, `.cpp`, `.cxx`, `.c++`, `.i`, `.ii`)
- Assembly file (`.s`, `.S`)
- Object file (`.o`)
- Static library (`.a`)

When compiling C language sources, invoke the compiler with `icc`. When compiling C++ language sources or a combination of C and C++, invoke the compiler with `icpc`.

**Command Line Syntax (Windows*)**

When you specify compiler options on the command line, the following syntax applies:

```
icl [options] [@response_file] file1 [file2 ...] [/link linker_options]
```

The `options` represents zero or more compiler options, the `linker_options` represents zero or more linker options, and the `file` is any of the following:

- C or C++ source file (`.c`, `.cc`, `.cpp`, `.cxx`, `.i`)
- Assembly file (`.asm`)
- Object file (`.obj`)
- Static library (`.lib`)

The optional `response_file` is a text file that lists the compiler options you want to include during compilation. See Using Response Files for additional information.

The compiler reads command line options from left to right. If your compilation includes competing options, then the compiler uses the one furthest to the right. For example:

```// Linux* and macOS*
icc -xSSSE3 main.c file1.c -xSSE4.2 file2.c
```

```// Windows*
icl /QxSSSE3 main.c file1.c /QxSSE4.2 file2.c```

The compiler sees `[Q]xSSSE3` and `[Q]xSSE4.2` as two forms of the same option, where only one form can be used. Since `[Q]xSSE4.2` is last (furthest to the right), it wins.

All options specified on the command line are used to compile each file. The compiler does not compile individual files with specific options. For example:

```// Linux* and macOS*
icc -O3 main.c file1.c -mp1 file2.c
```

```// Windows*
icl /O3 main.c file1.c /Qprec file2.c```
It may seem that `main.c` and `file1.c` are compiled with the option `-O3`, and `file2.c` is compiled with the `-m1` (Linux* and macOS*) or `/Qprec` (Windows*) option. This is not correct; all files are compiled with both options.

A rare exception to this rule is the `-x` type option:

```plaintext
// Linux* and macOS*
icc -x c file1 -x c++ file2 -x assembler file3
```

The `type` argument identifies each file type for the compiler.

**Default Operation**

The compiler invokes many options by default. In this example, the compiler includes the option `-O2` (and other default options) in the compilation:

```plaintext
// Linux* and macOS*
icc main.c
// Windows*
icl main.c
```

Each time you invoke the compiler, options listed in the corresponding configuration file (`icl.cfg` on Windows* or `icc.cfg/icpc.cfg` on Linux* and macOS*) override any competing default options. For example, if your configuration file includes the `-O3` option, the compiler uses `-O3` rather than the default `-O2` option. Use the configuration file to list the options for the compiler to use for every compilation. See Using Configuration Files.

Options specified in the command line environment variable override any competing default options and options listed in the configuration file.

Finally, options used on the command line override any competing options that may be specified elsewhere (default options, options in the configuration file, and options specified in the command line environment variable). If you specify the option `-O1` on the command line, this option setting takes precedence over competing option defaults and competing options in the configuration files, in addition to the competing options in the command line environment variable.

Certain `#pragma` statements in your source code can override competing options specified on the command line. For example, if a function in your code is preceded by `#pragma optimize("", off)`, then optimization for that function is turned off, even though `-O2` optimization is on by default, the `-O3` is listed in the configuration file, and the `-O1` is specified on the command line for the rest of the program.

**Using Options with Arguments**

Compiler options can be as simple as a single letter, such as the option `-E`. Many options accept or require arguments. The `-O` option, for example, accepts a single-value argument that the compiler uses to determine the degree of optimization. Other options require at least one argument and can accept multiple arguments. For most options that accept arguments, the compiler warns you if your option and argument are not recognized. If you specify `-O9`, the compiler issues a warning, ignores the unrecognized option `-O9`, and proceeds with the compilation.

The `-O` option does not require an argument, but there are other options that must include an argument. The `-I` option requires an argument that identifies the directory to add to the include file search path. If you use this option without an argument, the compiler will not finish its compilation.
Other Forms of Options

You can toggle some options on or off by using the negation convention. For example, the
\[Q\text{complex-limited-range}\] option (and many others) includes negation forms,
\[-no-complex-limited-range\] (Linux* and macOS*) and \[/Qcomplex-limited-range-\] (Windows*), to
change the state of the option. Since this option is disabled by default, you must use
\[Q\text{complex-limited-range}\] on the command line to toggle it to the ON state.

Option Categories

When you invoke the Intel® C++ Compiler and specify a compiler option, you have a wide range of choices to
influence the compiler's default operation. Intel® C++ Compiler options typically correspond to one or more
of the following categories:

- Advanced Optimization
- Code Generation
- Compatibility
- Component Control
- Data
- Deprecated
- Diagnostics
- Floating Point
- Help
- Inlining
- Interprocedural Optimizations (IPO)
- Language
- Linking/Linker
- Miscellaneous
- OpenMP* and Parallel Processing
- Optimization
- Output
- Profile Guided Optimization (PGO)
- Preprocessor

To see the included options in each category, invoke the compiler from the command line with the \texttt{help}
category option. For example:

\texttt{icc -help codegen //Linux* and macOS*}
\texttt{icl /help codegen //Windows*}

The help option prints to \texttt{stdout} with the names and syntax of the options found in the Code Generation
category.

See Also

Using Configuration files

Specifying Include Files

The Intel® C++ Compiler searches the default system areas for include files and items specified by the \texttt{I}
compiler option. The compiler searches directories for include files in the following order:

1. Directories specified by the \texttt{I} option
2. Directories specified in the environment variables
3. Default include directories

Use the \texttt{X} option to remove the default directories from the include file search path.

For example, to direct the compiler to search the path \texttt{/alt/include} instead of the default path, do the
following:
### Specifying Object Files

You can use the `/Fo` option (Windows*) or `-c` and `-o` options (Linux* and macOS*) to specify an alternate name for an object file. In this example, the compiler generates an object file name `myobj.obj` (Windows*) or `myobj.o` (Linux* and macOS*).

```c
// Linux* and macOS*
icpc -c -o myobj.o x.cpp
// Windows*
icl /Fo myobj x.cpp
```

### Specifying Assembly Files

You can use the `/Fa` option (Windows*) or `-S` and `-o` options (Linux* and macOS*) to specify an alternate name for an assembly file. The compiler generates an assembly file named `myasm.asm` (Windows*) or `myasm.s` (Linux* and macOS*).

```c
// Linux* and macOS*
icpc -S -o myasm.s x.cpp
// Windows*
icl /Fa myasm x.cpp
```

### See Also
- `/c` compiler option
- `-o` compiler option
- `/Fa` compiler option
Converting Projects to Use a Selected Compiler from the Command Line

You can use the command-line utility `ICProjConvert180.exe` to transform your Intel® C++ projects into Microsoft Visual C++* projects, or vice-versa. The syntax is:

```
ICProjConvert180.exe <sln_file | prj_files> [/VC[:"VCtoolset name"] | /IC[:"ICtoolset name"]> [/q] [/nologo] [/msvc] [/s] [/f]
```

Where:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sln_file</td>
<td>A path to the solution file, which should be modified to use a specified project system.</td>
</tr>
<tr>
<td>prj_files</td>
<td>A space separated list of project files (or wildcard), which should be modified to use specified project system.</td>
</tr>
<tr>
<td>/VC</td>
<td>Convert to use the Microsoft Visual C++* project system.</td>
</tr>
<tr>
<td>VCtoolset name</td>
<td>The possible values are v120 (Microsoft Visual Studio* 2013), v140 (Microsoft Visual Studio* 2015), or v141 (Microsoft Visual Studio* 2017).</td>
</tr>
<tr>
<td>/IC</td>
<td>Convert to use the Intel® C++ project system.</td>
</tr>
<tr>
<td>ICtoolset name</td>
<td>Intel C++ Compiler 18.0</td>
</tr>
<tr>
<td></td>
<td>Depending on the integration version, the supported name values may be different.</td>
</tr>
<tr>
<td>/q</td>
<td>Starts quiet mode, all information messages (except errors) are hidden.</td>
</tr>
<tr>
<td>/nologo</td>
<td>Suppresses the startup banner.</td>
</tr>
<tr>
<td>/msvc</td>
<td>Sets the compiler to Microsoft Visual C++*.</td>
</tr>
<tr>
<td>/s</td>
<td>Searches the project files through all subdirectories.</td>
</tr>
<tr>
<td>/f</td>
<td>Forces an update to the project even if it has an unsupported type or unsupported properties.</td>
</tr>
<tr>
<td>/? or /h</td>
<td>Shows help.</td>
</tr>
</tbody>
</table>

**Example**

Issue the command `ICProjConvert180.exe *.icproj /s /VC` to convert all Intel® C++ project files in the current directory and its subdirectories to use Microsoft Visual C++*.

**NOTE** If you uninstall the Intel® C++ Compiler, `ICProjConvert180.exe` remains in the folder `Program Files (x86)\Common Files\Intel\shared files\ia32\Bin` and you can use it to transform Intel® C++ projects back into Microsoft Visual C++*.

Using Eclipse* (Linux*)

The following topic applies to Eclipse* for C/C++. 

---

**Using Eclipse**

To use Eclipse, follow these steps:

1. Open Eclipse.
2. Select File > Open Project.
3. Navigate to your project directory and select the project file `*.icproj`.
4. Click Open.
5. In the Project Explorer, right-click the project and select Properties.
6. Navigate to the General tab and select Build Path > Sources > Add External Source Folders.
7. Select your project directory and click OK.
8. Save the project settings and click OK.
9. Build your project by selecting Build Project from the Build menu.

**NOTE** The above steps are for creating a new project in Eclipse with an Intel® C++ project. If you are converting an existing Microsoft Visual C++ project to an Intel® C++ project, you will need to adjust the project settings accordingly. 

---

**Using Eclipse on Linux**

The steps for using Eclipse on Linux are similar to those for Windows, but you may need to adjust the project settings for Linux-specific compiler flags and libraries.
The Intel® C++ Compiler for Linux® provides integrations for the compiler to Eclipse* and C/C++ Development Tooling* (CDT*) that let you develop, build, and debug your Intel® C/C++ projects in an integrated development environment (IDE).

Eclipse* is an open source software development project dedicated to providing a robust, full-featured, commercial-quality, industry platform for the development of highly integrated tools. It is an extensible, open source integrated development environment (IDE). CDT is a complete C/C++ IDE for the Eclipse* platform, which allows you to develop, build, and run Intel® C/C++ projects in a visual, interactive environment. CDT* is layered on Eclipse* and provides a C/C++ development environment perspective.

**NOTE** Eclipse* and CDT* are not bundled with the Intel® C++ Compiler. They must be obtained separately.

### Adding the Compiler to Eclipse*

The following topic applies to Eclipse* for C/C++.

To add the Intel® C++ Compiler product extension to your Eclipse* configuration:

1. Start Eclipse*.
2. Select **Help** > **Install New Software**.
3. Next to the **Work with** field, click the **Add** button. The **Add Repository** dialog box opens.
4. Click the **Local** button and browse to the `install_dir/ide_support_product_version/eclipse/compiler_xe` directory. Click **OK**.
5. Make sure the **Group items by category** is not checked.
6. Select the options containing Intel® that you wish to integrate, and click **Next**.
7. Follow the installation instructions.
8. When asked if you want to restart Eclipse*, select **Yes**.

When Eclipse* restarts, you can create and work with CDT projects that use the Intel® C++ Compiler.

### Multi-Version Compiler Support

The following topic applies to Eclipse* for C/C++.

You can select different versions of the Intel® C++ Compiler for compiling projects with the Eclipse* Integrated Development Environment (IDE). For a list of the currently supported compiler versions by platform, refer to the Intel® C++ Compiler Release Notes.

If multiple versions of Intel® C++ Compiler are installed on the system, Eclipse* uses the latest version by default. To select the version of Intel® C++ Compiler to build your project:

1. Right click the project and open **Properties**.
2. In the properties dialog box, select **C/C++ Build** > **Settings**.
3. Select the **Intel® C++ Compiler** tab.
4. Select the row with the desired compiler version.
5. Click **Use Selected**. Alternatively, click **Use Latest** to select the latest version of compiler.
6. Click **Apply**.

The corresponding compiler environment is configured automatically for your project.

Use **Settings** and **Tool Chain Editor** to select tools to be used within the toolchain, or set distinct project properties, like compiler options to be used with different versions of the Intel® C++ Compiler.

For any project, you can set the compiler environment by specifying it within Eclipse*; this overrides any other environment specifications for the compiler.

### Using Cheat Sheets

The following topic applies to Eclipse* for C/C++.
The Intel® C++ Compiler integration includes several Eclipse* cheat sheets that can guide you through various compilation and debugging tasks.

To view a list of available cheat sheets and select one:

2. Select a cheat sheet. Cheat sheets located outside of the Eclipse* integration can be entered in the Select a cheat sheet from a file or Enter the URL of a cheat sheet. Intel cheat sheets are located under Intel® C++ Compiler. A description of the cheat sheet appears in the lower pane.
3. To open a cheat sheet, click OK.

The Cheat Sheets view opens in the Eclipse* window.

Creating a Simple Project

Creating a New Project

The following topic applies to Eclipse* for C/C++.

To create a new Eclipse* project:

1. Select File > New > Project... The New Project wizard opens.
2. Expand the C/C++ Project tab and select the appropriate project type. Click Next to continue.
3. For Project name, enter hello_world. Deselect the Use default location to specify a directory for the new project.
4. In the Project Type list, expand the Executable project type and select Hello World [C or C++] Project.
5. In the Toolchains list, select Intel(R) C++ Compiler. Click Next.

**NOTE**
- If you need to see the toolchains for the compilers that are not locally installed, uncheck Show project types and toolchains only if they are supported on the platform. You are only able to view and configure these toolchains if the proper compilers are installed.
- If you have multiple versions of the Intel® C++ Compiler installed, they appear in the project’s properties under C/C++ Build > Settings on the Intel Compiler Selection tab.

6. The Basic Settings page allows specifying template information, including Author and Copyright notice, which appear as a comment at the top of the generated source file. The Hello world greeting string displayed by the hello_world program and Source directory relative to the project where the generated source file is created can be specified on this page. After entering desired fields, click Next.
7. The Select Configurations page allows specifying deployment platforms and configurations. By default, a Debug and Release configuration is created for the selected toolchain. Select no (Deselect all), multiple, or all (Select all) configurations. To edit project properties, click the Advanced settings button. Click Finish to create the hello_world project.

**NOTE** Configurations can be created after the project is created by selecting Project > Properties.

8. If the view is not the C/C++ Development Perspective (default), an Open Associated Perspective dialog box opens. In the C/C++ Perspective, click Yes to proceed.

An entry for your hello_world project appears in the Project Explorer view.

See Also

Adding a C Source File
Adding a C Source File

The following topic applies to Eclipse* for C/C++.

To add a source file to the hello_world project:
1. Select the hello_world project in the Project Explorer view.

   **NOTE** The dialog box automatically populates the source folder for the source file to be created. You can change this by entering a new location or selecting Browse.

4. Select a Template from the drop-down list or Configure a new template.
5. Click Finish to add the file to the hello_world project.
6. In the Editor view, add your code for new_source_file.c.
7. When your code is complete, Save your file.

See Also
Building a Project

Setting Options for a Project or File

The following topic applies to Eclipse* for C/C++.

You can specify compiler, linker, and archiver options at the project and source file level. Follow these steps to set options for a project or file:
1. Right-click a project or source file in the Project Explorer.
2. Select Properties. The property pages dialog box opens.
3. Select C/C++ Build > Settings.
4. Select the Tool Settings tab and click an option category for Intel C Compiler, Intel C++ Compiler, or Intel C++ Linker.
5. Set the options to apply to the project or file.

   **NOTE**
   - Some properties use check boxes, drop-down boxes, or dialog boxes to specify compiler options. For a description on options properties, hover over the option to display a tooltip. After setting the desired options in command line syntax, select Apply and then OK.
   - To specify an option that is not available from the Properties dialog, use the Command Line category. Enter the command line options in the Additional Options field using command line syntax. Click Add to add an argument to the list. Enter a valid argument for the option, then click OK.
   - You can specify option settings for one or more configurations by using the Configuration drop-down menu.

6. Click OK.

The compiler applies the selected options, using the selected configurations, when building.

   **Tip** To restore default settings to all properties for the selected configuration, click the Restore Defaults button on any property page.
Excluding Source Files from a Build

The following topic applies to Eclipse* for C/C++.

To exclude a source file from a build:

1. Right-click a file or folder in the Project Explorer.
2. Select Resource Configurations > Exclude from build.
   The Exclude from build dialog box opens.
3. Select one or more build configurations to exclude the file or folder from.
4. Click OK.

The compiler excludes that file or folder when it builds using the selected project configuration.

Building a Project

The following topic applies to Eclipse* for C/C++.

To build your project:

1. Select the hello_world project in the Project Explorer view.
2. Select Project > Build Project.

See the Build results in the Console view.

```
**** Incremental Build of configuration Release for project hello_world ****
make all
Building file: ../new_source_file.c
Invoking: Intel C Compiler
new_source_file.c"
Finished building: ../new_source_file.c

Building target: hello_world
Invoking: Intel C Linker
icc -o "hello_world" ./new_source_file.o
Finished building target: hello_world

Build Finished
```

Detailed descriptions of errors, warnings, and other output can be viewed by selecting the Problems tab.

Running a Project

The following topic applies to Eclipse* for C/C++.

After building a project, you can run your project by following these steps:

1. Select the hello_world project in the Project Explorer view.
2. Select Run As > Local C/C++ Application.
3. On the Launch Debug Configuration Selection dialog box, select a debugger, then click OK.

When the executable runs, the output appears in the Console view.

Intel® C/C++ Error Parser

The following topic applies to Eclipse* for C/C++.

The Intel® C/C++ Error Parser (selected by default) lets you track compile-time errors in Eclipse*/CDT. To confirm that the Intel® C/C++ Error Parser is active:

1. Select the hello_world project in the Project Explorer view.
2. Select Project > Properties.
3. In the Properties dialog box, select C/C++ Build > Settings.
4. Click the Error Parsers tab. Make sure that Intel C/C++ Error Parser is checked, and CDT Visual C Error Parser or Microsoft Visual C Error Parser are not checked.
5. Click OK to update your choices, if you have changed any settings.

Using the Intel® C/C++ Error Parser
The Intel® C/C++ Error Parser automatically detects and manages the diagnostics generated by the Intel® C++ Compiler.

If an error occurring in the hello_world.c program is compiled, for example, #include <xstdio.h>, the error is reported in the Problems view next to an error marker.

You can double-click on each error in the Problems view to highlight the source line, which causes the error in the Editor view.

Correct the error, then rebuild your project.

Make Files

Project Types and Makefiles
The following topic applies to Eclipse* for C/C++.

When creating a new Intel® C++ project in Eclipse*, Executable, Shared Library, Static Library, or Makefile project types are available for selection.

- Select Makefile Project if the project already includes a makefile.
- Use Executable, Shared Library, or Static Library Project to build a makefile using options assigned from property pages specific to the Intel® C++ Compiler.

Exporting Makefiles
The following topic applies to Eclipse* for C/C++.

Eclipse* can build a makefile that includes Intel® C++ Compiler options for created Executables, Shared Libraries, or Static Library Projects. See Setting Options for a Project or File. When the project is complete, export the makefile and project source files to another directory, then build the project from the command line using make.

Exporting makefiles
To export the makefile:

1. Select the project in the Eclipse* Project Explorer view.
2. Select File > Export to launch the Export Wizard. The Export dialog box opens, showing the Select screen.
3. Select General > File system, then click Next. The File System screen opens.
4. Check both the hello_world and Release directories in the left-hand pane. Ensure all project sources are checked in the right-hand pane.

NOTE Some files in the right-hand pane may be deselected, such as the hello_world.o object file and the hello_world.exe executable. The, Create directory structure for files in the Options section must be selected to successfully create the export directory. This applies to project files in the hello_world directory.
5. Use the **Browse** button to target the export to an existing directory. Eclipse* can create a new directory for full paths entered in the **To directory** text box. For example, if the `/code/makefile` is specified as the export directory, Eclipse* creates two new sub-directories:

   - `/code/makefile/hello_world`
   - `/code/makefile/hello_world/Release`

6. Click **Finish** to complete the export.

**Running make**

In a terminal window, change to the `/cpp/hello_world/Release` directory, then run make by typing: `make clean all`.

You should see the following output:

```
rm -rf  ./new_source_file.o  ./new_source_file.d  hello_world
Building file: ../new_source_file.c
Invoking: Intel C Compiler
  new_source_file.c"
  Finished building: ../new_source_file.c
Building target: hello_world
Invoking: Intel C Linker
 icc  -o "hello_world"  ./new_source_file.o
  Finished building target: hello_world
```

This generates the `hello_world.exe` executable in the same directory.

Setting Options for a Project or File

**Using Intel® Performance Libraries with Eclipse***

The following topic applies to Eclipse* for C/C++.

You can use the Intel® C++ Compiler with the following Intel® Performance Libraries that may be included as a part of the product:

- Intel® Data Analytics Acceleration Library (Intel® DAAL)
- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® Threading Building Blocks (Intel® TBB)
- Intel® Math Kernel Library (Intel® MKL)

To access these libraries in Eclipse*, use the property pages:

1. Select your project.
2. Open the property pages from **Project > Properties** and select **C/C++ Build > Settings**.
3. Select **Intel C/C++ Compiler > Performance Library Build Components**.

The **Use Intel® Data Analytics Acceleration Library** property allows enabling the library and bringing in the associated headers.

- **None**: Disable Use of Intel® DAAL.
- **Use threaded Intel® DAAL**: Link using the threaded version of the library.
- **Use non-threaded Intel® DAAL**: Link using the non-threaded version of the library.

The **Use Intel® Integrated Performance Primitives Libraries** property provides the following options in a drop-down menu:

- **None**: Disable use of Intel® IPP.
• **Use main libraries set:** Use all libraries except Cryptography libraries.
• **Use main libraries and cryptography library:** Use Cryptography libraries and main libraries.
• **Use non-pic version of libraries:** Use the non-pic version of the main libraries.
• **Use cryptography library and non-pic version of libraries:** Use Cryptography libraries and the non-pic version of the main libraries.

**NOTE** The Cryptography libraries are subject to export laws.

The **Use Intel® Math Kernel Library** property provides the following options in a drop-down menu:

• **None:** Disables the use of the Intel® MKL.
• **Use threaded Intel® MKL:** Link using the threaded version of the library.
• **Use non-threaded Intel® MKL:** Link using the non-threaded version of the library.
• **Use Intel® MKL Cluster and sequential Intel® MKL libraries:** Link using the Intel® MKL Cluster Edition libraries and the sequential Intel® MKL libraries.

The **Use Intel Threading Building Blocks Library** on the **Property** page allows enabling the library and bringing in the associated headers.

For more information, see the Intel® DAAL, Intel® IPP, Intel® MKL, and Intel® TBB documentation.

### Using Microsoft Visual Studio® (Windows*)

You can use the Intel® C++ Compiler within the Microsoft Visual Studio® integrated development environment (IDE) to develop C++ applications, including static library (**.LIB**), dynamic link library (**.DLL**), and main executable (**.EXE**) applications. This environment makes it easy to create, debug, and execute programs. You can build your source code into several types of programs and libraries, using the IDE or from the command line.

The IDE offers these major advantages:

• Makes application development quicker and easier by providing a visual development environment.
• Provides integration with the native Microsoft Visual Studio® debugger.
• Makes other IDE tools available.
Creating a New Project

When you create a project, Microsoft Visual Studio* automatically creates a corresponding solution to contain it. To create a new Intel® C++ project using Microsoft Visual Studio*:

1. Select File > New > Project.
2. In the left pane, expand Visual C++ and select Win32.
3. In the right pane, select Win32 Console Application.
4. Accept or specify a project name in the Name field. For this example, use hello32 as the project name.
5. Accept or specify the Location for the project directory. Click OK.
6. In the Win32 Application Wizard that appears, click Next to continue.
7. In Application Settings that appear, check the Empty project box for this example. Click Finish to complete the new project.

The hello32 project assumes focus in the Solution Explorer view. The default Microsoft Visual Studio* solution is also named hello32.

Your newly created project is a Visual C++* project. To specify that you want to use the Intel® C++ Compiler for your Microsoft Visual Studio* project, use the Project > Intel Compiler > Use Intel C++ toolbar option.

Adding Source Files

Before you can build the hello32 project, you need to add a source file to the empty project. Follow these steps:

1. Right-click the Source Files folder in the Solution Explorer and select Add > New Item... The Add New Item dialog box opens.
2. In the left pane, expand the selections under Visual C++ and select Code.
3. In the right pane, select C++ File (.cpp).
4. Enter hello32.cpp for the file name, then click Add.
5. Use the Microsoft Visual Studio* editor to add Hello World code to hello32.cpp. Be sure to save your work when you are finished.

Using the Intel® C++ Compiler

Using the Intel® C++ Compiler within Microsoft Visual Studio*

1. Create a Visual C++* project, or open an existing project.
2. In Solution Explorer, select the project(s) to build with Intel® C++ Compiler.
3. Open Project > Properties.
4. In the left pane, expand the Configuration Properties category and select the General property page.
5. In the right pane, change the Platform Toolset to Intel C++ Compiler.

Alternatively, you can change the toolset by selecting Project > Intel Compiler > Use Intel C++. This sets whichever version of the Intel® Compiler that you specify as the toolset for all supported platforms and configurations.
6. To add options, go to Project > Properties > C/C++ > Command Line and add new options to the Additional Options field. Alternatively, you can select options from Intel specific properties. Refer to complete list of options in the Compiler Options section in this documentation.

7. Rebuild, using either Build > Project only > Rebuild for a single project, or Build > Rebuild Solution for a solution.

Verify Use of the Intel® C++ Compiler

To verify the use of the Intel C+ Compiler:

1. Go to Project > Properties > C/C++ > General.
2. Set Suppress Startup Banner to No. Click OK.
3. Rebuild your application.
4. Look at the Output window.

You should see a message similar to the following when using the Intel® C++ Compiler:

```
Intel(R) C++ Intel(R) 64 Compiler for applications running on XXXX, Version XX.X.X.X
```

Unsupported Visual C++* Project Types

The following project types are not supported:

- Class Library
- CLR Console Application
- CLR Empty Project
- Windows* Forms Application
- Windows* Forms Control Library

Tips for Ease of Use

- Create a separate configuration for building with Intel® C++ Compiler:
  - After you have created your project and specified it as an Intel® C++ project, create a new configuration (for example, "rel_intelc" based on "Release" configuration or "debug_intelc" based on "Debug" configuration).
  - Add any special optimization options offered by Intel® C++ Compiler only to this new configuration (for example, "rel_intelc" or "debug_intelc") through the project property page.
  - Build with Intel® C++ Compiler.

Building Your Intel® C++ Project

After selecting the Intel® C++ compiler for your project(s), you can build Intel® C++ projects the same way you build Visual C++* projects. After changing compilers, build your project using Rebuild, rather than Build.

To build your Intel® C++ project:

1. Select your Intel® C++ project in the Solution Explorer view.
2. Right-click and select Build Solution or Rebuild Solution to build the solution.

**NOTE**

If the project hello32 is selected instead of solution 'hello32' (at the top of Solution Explorer), you can select Project Only > Build or Project Only > Rebuild to build a single project.

The results of the compilation are displayed in the Output window.
Selecting the Compiler Version

If you have multiple versions of the Intel® C++ Compiler installed, you can select which version you want from the Compiler Selection dialog box:

1. Select a project, then go to Tools > Options > Intel Compilers and Tools > C++ > Compilers.
2. Use the Selected Compiler drop-down menu to select the appropriate version of the compiler.
3. Click OK.

Switching Back to the Visual C++* Compiler

If your project is using the Intel® C++ Compiler, you can choose to switch back to the Microsoft Visual C++* Compiler by doing the following:

1. Select your project.
2. Right-click and select Intel Compiler > Use Visual C++ from the context menu.

Selecting a Configuration

A configuration contains settings that define the final binary output file that you create within a project. It specifies the type of application to build, the platform on which it is to run, and the tool settings to use when building.

Debug and Release Configurations

When you create a new project, Visual Studio* automatically creates the following configurations:

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug configuration</td>
<td>By default, the debug configuration sets project options to include the debug symbol information in the debug configuration. It also turns off optimizations. Before you can debug an application, you must build a debug configuration for the project.</td>
</tr>
<tr>
<td>Release (Retail) configuation</td>
<td>The release configuration does not include the debug symbol information, and it uses any optimizations that you have chosen.</td>
</tr>
</tbody>
</table>

Use the Visual Studio* Configuration Manager to select:

1. Release or Debug configuration for the active solution.
2. Release or Debug configuration for any project within the active solution.
3. Target platform for each project.

To make configuration changes for your project:

1. Choose an active solution in the Solution Explorer.
2. Go to Build > Configuration Manager.
3. Select a configuration.

New Configurations

In addition to the default Debug and Release configurations, you can also define new configurations within your project. These configurations may use the existing source files in your project, the existing project settings, or other characteristics of existing configurations.
Specifying a Target Platform

You can specify a target platform for a Microsoft Visual Studio® solution or an individual project within a solution.

1. Select a solution or project in the Solution Explorer.
2. Select Build > Configuration Manager.
   - Use the Active solution platform drop-down list to specify the target platform for the whole solution.
   - Use the Platform column to specify the target platform for an individual project within a solution.
3. Select <New...> on the Active solution platform drop-down menu to add a platform to the current list of active solution platforms.
4. Select or type a new platform in the New Solution Platform dialog box.
5. In Copy settings from choose a platform to use as a template or choose <Empty>.
6. If you want the platform to be set for the projects within the solution, select Create new project platforms. Click OK.
7. Close the Configuration Manager.

NOTE You can also change target platforms from the Microsoft Visual Studio® toolbar by selecting a platform from the Solution Platforms drop-down selection.

Removing Target Platforms

You can remove a target platform from the Configuration Manager:

1. Select <Edit...> from the active solution platform list of options.
2. In the Edit Solutions Platforms dialog that opens, select a platform and click Remove.
3. Click Yes in the confirmation box.

Specifying Directory Paths

To change path locations in Microsoft Visual Studio*: 

1. Go to Project > Properties. Expand the Configuration Properties category and select VC++ Directories.
2. In the left pane, select Configuration Properties > VC++ Directories.
3. In the right pane, edit the directory paths.

Specifying a Base Platform Toolset with the Intel® C++ Compiler

By default, when your project uses the Intel® C++ Compiler, the Base Platform Toolset property is set to use that compiler with the build environment, including paths, libraries, included files, etc., of the toolset specific to the version of Microsoft Visual Studio® you are using.

You can set the general project level property Base Platform Toolset to use one of the non-Intel installed platform toolsets as the base.

For example, if you are using Microsoft Visual Studio* 2017, and you selected the Intel® C++ Compiler in the Platform Toolset property, then the Base Platform Toolset uses the Microsoft Visual Studio* 2017 environment (v141). If you want to use other environments from Microsoft Visual Studio* along with the Intel® C++ Compiler, set the Base Platform Toolset property to:

- **v120** for Microsoft Visual Studio* 2013
• **v140** for Microsoft Visual Studio* 2015

This property displays all installed toolsets, not including Intel toolsets.

To set the Base Platform Toolset:

- Using property pages:
  1. Select the project and open **Project > Properties**.
  2. In the left pane, select **Configuration Properties > General**.
  3. In the right pane, find **Intel Specific > Base Platform Toolset**.
  4. Select a value from the pop-up menu.
- Using the `msbuild.exe` command line tool, use the `/p:PlatformToolset` and `/p:BasePlatformToolset` options.

Example: When the Platform Toolset property is already set to use the Intel® C++ Compiler, to build a project using the Microsoft Visual Studio* 2013 environment use the following command:

```
Msbuild.exe myproject.vcxproj /p:BasePlatformToolset=v120
```

Example: To explicitly set the Platform Toolset property to use the Intel® C++ Compiler and build a project using the Microsoft Visual Studio* 2013 environment use the following command:

```
Msbuild.exe myproject.vcxproj /p:PlatformToolset="Intel C++ Compiler 18.0" /p:BasePlatformToolset=v120
```

For possible values for the `/p:BasePlatformToolset` property, see the properties described above.

The next time you build your project with the Intel® C++ Compiler, the option you selected is used to specify the build environment.

### Using Property Pages

The Intel® C++ Compiler integration with Microsoft Visual Studio* includes support for Property Pages to manage both Intel-specific and general compiler options.

To set compiler options in Microsoft Visual Studio*:

1. Right-click on a project or source file in the **Solution Explorer** view.
2. Select **Properties** from the pop-up menu.
3. In the **Property Pages** dialog box, expand the **C/C++** section to view the categories of compiler options.
4. Select a category, then change the compiler options on the corresponding Property Page in the right-hand pane. Some categories contain Intel-specific properties; these categories are marked with [Intel C++]. For example, there is a **Code Generation** and **Code Generation [Intel C++]** category. The latter contains properties specific to the Intel® C++ Compiler.
5. Click **OK** to complete your selection.

The option you selected is used in the compilation the next time you build your project.

### Using Intel® Performance Libraries with Microsoft Visual Studio*

You can use the Intel® C++ Compiler with the following Intel® Performance Libraries that may be included as a part of the product:

- Intel® Data Analytics Acceleration Library (Intel® DAAL)
- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® Threading Building Blocks (Intel® TBB)
- Intel® Math Kernel Library (Intel® MKL)

Use the property pages to specify Intel® Performance Libraries to use with the selected project configuration. The functionality supports both Intel® C++ and Microsoft Visual C++* project types.

To specify Intel® Performance Libraries, select **Project > Properties**. In **Configuration Properties**, select **Intel Performance Libraries**, then do the following:
1. To use Intel® Data Analytics Acceleration Library change the Use Intel® DAAL settings as follows:
   - **No:** Disable Use of Intel® DAAL.
   - **Default Linking Method:** Use Intel® DAAL libraries that depend on the settings for the Code Generation > Runtime Library property.
   - **Multi-threaded Static Library:** Use parallel static Intel® DAAL libraries.
   - **Single-threaded Static Library:** Use parallel sequential static Intel® DAAL libraries.
   - **Multi-threaded DLL:** Use parallel dynamic Intel® DAAL libraries.
   - **Single-threaded DLL:** Use parallel sequential static Intel® DAAL libraries.

2. To use Intel® Integrated Performance Primitives, change the Use Intel IPP settings as follows:
   - **No:** Disable use of Intel® IPP libraries.
   - **Default Linking Method:** Use Intel® IPP libraries that depend on the settings for the Code Generation > Runtime Library property.
   - **Multi-threaded Static Library:** Use parallel static Intel® IPP libraries.
   - **Single-threaded Static Library:** Use parallel sequential static Intel® IPP libraries.
   - **Multi-threaded DLL:** Use parallel dynamic Intel® IPP libraries.
   - **Single-threaded DLL:** Use parallel sequential static Intel® IPP libraries.

3. To use Intel® Threading Building Blocks in your project, change the Use Intel TBB settings as follows:
   - **No:** Disable use of Intel® TBB libraries.
   - **Use TBB:** Set to Yes to use Intel® Threading Building Blocks.
   - **Instrument for use with Intel® Threading Analysis Tools:** Set to Yes to add the preprocessor definition TBB_USE_THREADING_TOOLS to the project property Preprocessor > Preprocessor Definitions.

   **NOTE** The TBB_USE_THREADING_TOOLS definition will be added only if the project property Code Generation > Runtime Library is set to Multi-threaded DLL (option MD).

4. To use Intel® Math Kernel Library in your project, change the Use Intel MKL property settings as follows:
   - **No:** Disable use of Intel® MKL libraries.
   - **Parallel:** Use parallel Intel® MKL libraries.
   - **Sequential:** Use sequential Intel® MKL libraries.
   - **Cluster:** Use cluster Intel® MKL libraries.

   If your target platform is set to x64, a final selection appears: Use ILP64 interfaces. If selected, the corresponding ilp MKL libraries is added to the linker command line. Additionally, the MKL_ILP64 preprocessor definition is added to the compiler command line. If you do not make this selection, lp MKL libraries are used.

   **NOTE** Sets of libraries for each option depend on selected target platform and project properties defined by Code Generation > Runtime Library and Advanced > Calling Convention.

Additional settings for use with the Microsoft Visual C++ Platform Toolset are available on the Intel® Performance Libraries category, found at Tools > Options.

**NOTE** The "Use Intel® MKL", "Use Intel® DAAL", "Use Intel® IPP", and "Use Intel® TBB" properties in Microsoft Visual Studio* mimic the behavior of the /Qmkl, /Qdaal, /Qipp and /Qtbb compiler options. The include and library paths to the performance library, which are installed with the selected Intel® C++ Compiler, are set up with these properties. To override this behavior refer to the article Usage of Intel® Performance Libraries with Intel® C++ Compiler in Visual Studio.

For more information, see the Intel® Integrated Performance Primitives, Intel® Threading Building Blocks, and Intel® Math Kernel Library documentation.
# Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

---

## Changing the Selected Intel® Performance Libraries

If you have installed multiple versions of the Intel® Performance Libraries, you can specify which version to use with the Microsoft Visual C++® compiler. To do this:

1. Select **Tools > Options**.
2. In the left pane, select **Intel Compilers and Tools > Performance Libraries**.
3. Select the desired library version from the drop-down boxes in the right pane.

For more information, see the Intel® Integrated Performance Primitives, Intel® Threading Building Blocks, and Intel® Math Kernel Library documentation.

---

## Including MPI Support

By default, when your project uses the Intel® C++ compiler, the Platform Toolset property is set to use the Intel® compiler, together with the build environment, including paths, libraries, include files, etc., of the toolset specific to the version of Visual Studio you are using.

If you select a version of MPI that is not installed, you will get build errors.

To specify the type of MPI support you want:

1. Open the project's property pages and select **Configuration Properties > Intel Performance Libraries**.
2. Set the property **Use Intel MKL** to **Cluster**.
3. Set the property **Use MPI Library** to one of the following values:
   - Intel(R) MPI
   - MPICH2
   - MS MPI
4. Build the project.

The next time you build your project with the Intel® C++ compiler, it will include support for the version of MPI that you specified.

---

## Using Guided Auto Parallelism in Microsoft Visual Studio®

The Guided Auto Parallelism (GAP) feature helps you locate portions of your serial code that can be parallelized. When you enable analysis using GAP, the compiler guides you to places in your code where you can increase efficiency through automatic parallelization and vectorization.

### Running Analysis on a Project

You can start analysis from the Microsoft Visual Studio® IDE in several ways:

- From the **Tools** menu: Select **Intel Compiler > Guided Auto Parallelism > Run Analysis...**
Starting analysis in this way results in a one-time run for the current project. The default values are taken from **Tools > Options** unless you have chosen to override them in the dialog box.

- From the Diagnostics property page: Use the **Guided Auto Parallelism Analysis** property.

  Specifically, choose **Project > Properties > C/C++ > Diagnostics** and enable analysis using the **Guided Auto Parallelism Analysis** property. Enabling analysis in the property page allows you to run an analysis as part of a normal project **Build** request in Microsoft Visual Studio*. In this mode, GAP-related settings in **Tools > Options** are ignored, in favor of other GAP-related settings available in the property page.

- From the context menu: Right-click and select **Intel Compiler > Guided Auto Parallelism > Run Analysis**.

  This is equivalent to using the **Guided Auto Parallelism > Run Analysis** option on the **Tools** menu.

To receive advice for auto parallelization, be sure that certain property page settings are correct. Select **Project > Properties > C/C++ > Optimization [Intel C++]** and set **Parallelization** to **Yes** to enable auto-parallelization optimization. You may also need to set the **Optimization** level at option **O2** or higher. To do this, use the **Optimization** property page.

### GAP Scenarios

To illustrate how the various GAP settings work together, consider the following scenarios:

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The GAP analysis setting in the property pages is set to Enabled.</td>
<td>Analysis always occurs for the project, whenever a regular project build occurs. Other analysis settings specified in the property pages are used. Analysis setting in <strong>Tools &gt; Options</strong> are ignored.</td>
</tr>
<tr>
<td>The Gap analysis setting in the property pages is set to Disabled, and GAP is run from the <strong>Tools</strong> menu.</td>
<td>Analysis occurs for this one run. The default values for this analysis are taken from <strong>Tools &gt; Options</strong> and can be overridden in the dialog box. Options specified in the property pages are also used, but will be overridden by any specified analysis option.</td>
</tr>
<tr>
<td>The GAP analysis setting in the property pages is set to Disabled, and GAP options are set in <strong>Tools &gt; Options</strong>.</td>
<td>No analysis occurs, unless analysis is explicitly run from the <strong>Tools</strong> menu.</td>
</tr>
</tbody>
</table>

### Running Analysis on a File or within a File

Right-click on **Guided Auto Parallelism** context menu item to run analysis on the following:

- **Single file**: Select a file and right-click.
- **Function (routine)**: Right-click within the function scope.
- **Range of lines**: Select one or more lines for analysis and right-click.

Using Code Coverage in Microsoft Visual Studio*

The code coverage tool provides the ability to determine how much application code is executed when a specific workload is applied to the application. The tool analyzes static profile information generated by the compiler, as well as dynamic profile information generated by running an instrumented form of the application binaries on the workload. The tool can generate a report in HTML-format and export data in both text- and XML-formatted files. The reports can be further customized to show color-coded, annotated source-code listings that distinguish between used and unused code.

To start code coverage:

1. Select **Tools** > **Intel Compiler** > **Code Coverage**...
2. Specify settings for the various phases.
3. Click **Run**.

The Output window shows the results of the coverage and a general summary of information from the code coverage.

Code Coverage Settings dialog box
Code Coverage Tool

Using Profile Guided Optimization in Microsoft Visual Studio*

Profile Guided Optimization (PGO) improves application performance by reorganizing code layouts to reduce instruction-cache problems, shrinking code size, and reducing branch misprediction. PGO provides information to the compiler about areas of an application that are most frequently executed. By knowing these areas, the compiler is able to be more selective and specific in optimizing the application.

To start PGO:

1. Choose **Tools** > **Intel Compiler** > **Profile Guided Optimization**...
2. Specify settings for the various phases.
3. Click **Run**.

The Output windows show the results of the optimization with a link to the composite log.

Options: Profile Guided Optimization dialog box
Profile Guided Optimization

Performing Parallel Project Builds

Visual Studio* provides a parallel project build feature, allowing you to build multiple projects within a solution simultaneously, using separate threads. The Visual Studio* IDE initially sets the number of parallel project builds to equal the number of CPUs. To change this setting, do the following:

1. Choose **Tools** > **Options** > **Projects and Solutions**.
2. In the Build and Run property page, change the number in maximum number of parallel project builds and click OK.

For more information on using this feature, see the Microsoft MSDN* documentation.

### Optimization Reports: Enabling in Microsoft Visual Studio*

Optimization reports can help you address vectorization and optimization issues.

When you build a solution or project, the compiler generates optimization diagnostics. You can view the optimization reports in the following windows:

- The **Compiler Optimization Report** window, either grouped by loops or in a flat format.
- The **Compiler Inline Report** window.
- The optimization annotations, which are integrated within the source editor.

To enable viewing for the optimization reports:

1. In your project's property pages, select **Configuration Properties > C/C++ > Diagnostics [Intel C++].**
2. Set a non-default value for any of the following options:
   - **Optimization Diagnostics Level**
   - **Optimization Diagnostics Phase**
   - **Optimization Diagnostics Routine**
3. Build your project to generate an optimization report.

When the compiler generates optimization diagnostics, the **Compiler Optimization Report** and the **Compiler Inline Report** windows open, and the optimization report annotations appear in the source editor.

**NOTE** You can specify how you want the optimization reporting to appear with the Optimization Reports dialog box. Access this dialog box by selecting Tools > Options > Intel Compilers and Tools > Optimization Reports.

### See Also

Options: Optimization Reports dialog box

### Optimization Reports: Viewing

When the compiler generates optimization diagnostics, the **Compiler Optimization Report** and the **Compiler Inline Report** windows open, and optimization report annotations appear in the editor.

#### Compiler Optimization Report window

The **Compiler Optimization Report** window displays diagnostics for the following phases of the optimization report:

- PGO
- LOOP
- PAR
- VEC
- Offload
- OpenMP
- CG

Information appears in this window grouped by loops, or in a flat format. To switch the presentation format, click the gear button on the toolbar of the window, and uncheck **Group by loops**.

In addition to sorting information by clicking column headers and resizing columns, you can use the windows described in the following table:
### Compiler Inline Report window

The **Compiler Inline Report** window displays diagnostics for the IPO phase of the optimization report. Information appears in this window in a tree. Each entry in the tree has corresponding information in the right-hand pane under the **Properties** tab and the **Inlining options** tab.

You can use the window as described in the following table:

<table>
<thead>
<tr>
<th>Do This</th>
<th>To Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td>Double-click a diagnostic in the tree, or click on the source position link under the <strong>Properties</strong> tab.</td>
<td>Jump to the corresponding position in the editor.</td>
</tr>
<tr>
<td>Click <strong>Just My Code</strong>.</td>
<td>Only display functions from your code, filter all records from files that don't belong to the current solution file tree.</td>
</tr>
<tr>
<td>Right-click on a function body in the editor and select <strong>Intel Compiler &gt; Show Inline report for function name</strong>.</td>
<td>View detailed information for the specified function.</td>
</tr>
</tbody>
</table>

---

![Compiler Inline Report window](image)
Do This | To Do This
--- | ---
Right-click on a function body in the editor and select **Intel Compiler > Show where function name in inlined.** | Show where the specified function is inlined.
Enter text in the search box in the **Compiler Inline Report** window toolbar. | Filter diagnostics using the text pattern.
Diagnostics are filtered when you stop typing.
Pressing Enter saves this pattern in the search history.
To disable filtering, clear the search box.
To use a pattern from the search history, click on the down arrow next to the search box.

**Viewing Optimization Notes in the Editor**

Viewing optimization notes in the editor provides context for the diagnostics that the compiler generates.

1. In Caller Site
2. In Callee Site
3. In Caller and Callee Site

You can use optimization notes as described in the following table:

<table>
<thead>
<tr>
<th>Do This</th>
<th>To Do This</th>
</tr>
</thead>
</table>
| Right-click an optimization note | • Expand or collapse the current optimization note, or all of them.  
• Open the **Optimization Reports** dialog box to adjust settings for optimization report viewing. You can view optimization notes in one of the following locations:
  • **Caller Site**
  • **Callee Site**
  • **Caller Site and Callee Site** |
| Double-click an optimization note heading. | Expand or collapse the current optimization note. |
| Double-click a diagnostic detail. | Jump to the corresponding position in the editor. |
| Click a hyperlink in the optimization note. | Show where the specified function is inlined. |
| Click the help (?) icon. | Get detailed help for the selected diagnostic. The default browser opens and, if you are connected to the internet, displays the help topic for this diagnostic. |
| Hover the mouse over a collapsed optimization note. | View a detailed tooltip about that optimization note. |

Profile Guided Optimization dialog box

This topic has information on the following dialog boxes:

• Profile Guided Optimization (PGO) dialog box
• Application Invocations dialog box
• **Edit Command** dialog box
• **Command** dialog box

**Profile Guided Optimization dialog box**

To access the **Profile Guided Optimization** dialog box, choose **Tools** > **Intel Compiler** > **Profile Guided Optimization**.

Use the **Profile Guided Optimization** dialog box to set the options for profile guided optimization.

**Phase 1 - Instrument:** This phase produces an instrumented object file for the profile guided optimization. The command line compiler option for each optimization instrument you choose appears in **Compiler Options**.

- **Enable Function Ordering in the optimized application:** Select this checkbox to enable ordering of static and extern routines using profile information. This optimization specifies the order in which the linker should link the functions of your application. This optimization can improve your application performance by improving code locality and by reducing paging.
- **Enable Static Data Layout in the optimized application:** Select this checkbox to enable ordering of static global data items based on profiling information. This optimization specifies the order in which the linker should link global data of your program. This optimization can improve application performance by improving the locality of static global data, reduce paging of large data sets, and improve data cache use.
- **Instrument with guards for threaded application:** Select this checkbox to produce an instrumented object file that includes the collection of PGO data on applications that use a high level of parallelism.

Selecting an option produces a static profile information file (.spi), but also increases the time needed to do a parallel build.

Deselect the checkbox to skip this phase to save time running profile guided optimization. When you skip this phase, you use the existing profile information when running profile guided optimization. For example, you may want to skip this phase when you change the code to fix a bug and the fix doesn't affect the architecture of the project.

**Phase 2 - Run Instrumented Application(s):** This phase runs the instrumented application produced in the previous phase as well as other applications in the **Applications Invocations** dialog box. To add a new application or edit an existing application in the list, click **Applications Invocations**.

Deselect the checkbox to skip this phase to save time running profile guided optimization. When you skip this phase, you do not run the applications in the list when running profile guided optimization. For example, you might want to skip this phase when you change the code to fix a bug and the fix doesn't affect the architecture of the project.

**Phase 3 - Optimize with Profile Data:** This phase performs the profile guided optimization.

Deselect the checkbox to skip this phase.

**Profile Directory:** The directory that contains the profile. Click **Edit** to edit the profile directory or the **Browse** button to browse for the profile directory.

**Show this dialog next time:** Deselect this checkbox to run profile guided optimization without displaying this dialog box. The profile guided optimization will use these settings.

**Save Settings:** Click to save your settings.

**Run:** Click to start the profile guided optimization.

**Cancel:** Click to close this dialog box without starting the profile guided optimization.

**Application Invocations dialog box**

To access the **Application Invocations** dialog box, click **Application Invocations...** in the **Profile Guided Optimization** dialog box. Use the **Profile Guided Optimization** dialog box to configure the application options for your application as well add additional applications when you run profile guided optimization.
The list of applications comes from the debug settings of the **Startup Project**.

**Merge Environment**: Select this checkbox to merge the application environment with the environment defined by the operating system.

To add, edit, or remove an application, click one of the buttons.

**Add**: Click to add a new application in the **Edit Command** dialog box.

**Duplicate**: Click after selecting an application to copy its settings so that you can use a different setting.

**Edit**: Click after selecting an application to change its settings in the **Edit Command** dialog box.

**Delete**: Click to remove the selected application from the list.

**OK**: Click to save the settings and close this dialog box.

**Cancel**: Click to discard the settings and close this dialog box.

**Edit Command dialog box**

To access the **Edit Command** dialog box, click **Add** or **Edit** in the **Application Invocations** dialog box. Use the **Edit Command** dialog box to add a new or edit an existing application in the **Application Invocations** dialog box.

**Command**: Add a new or edit an existing application. Click **Edit** to open the **Command** dialog box with a list of macros. Click **Browse** to navigate to another directory that contains the application.

**Command Arguments**: Enter the arguments required by the application.

**Working Directory**: Enter a new or edit the working directory for the application. Click **Edit** to open the **Command** dialog box with a list of macros. Click **Browse** to navigate to working directory of the application.

**Environment**: Enter the environment variable required by this application.

**Merge Environment**: Select this checkbox to merge the application environment with the environment defined by the operating system.

**Load from Debugging Settings**: Click to load the debug settings for this application.

**OK**: Click to save the settings and close this dialog box.

**Cancel**: Click to discard the settings and close this dialog box.

**Command dialog box**

To access the **Command** dialog box, click **Edit** in the **Edit Command** dialog box. Use the **Command** dialog box to specify or change the macro used in the application to run as part of the profile guided optimization. Select a macro from the list and then click one of the buttons.

**Macro**: Click to show or close the list of available macros.

**Insert**: Click to use the selected macro.

**OK**: Click to save the settings and close this dialog box.

**Cancel**: Click to discard the settings and close this dialog box.

Using Profile Guided Optimization in Microsoft* Visual Studio*

Profile Guided Optimization dialog box

Profile-Guided Optimizations

**Configure Analysis dialog box**

Use the Configure Analysis dialog box to specify settings for Guided Auto Parallelism (GAP) analysis and run the analysis.

To access this dialog box, click Tools > Intel Compiler > Guided Auto Parallelism > Run Analysis...

**Configure Analysis Options**

**Level of Analysis:** Specify the desired level of analysis. Choose Simple, Moderate, Maximum, or Extreme.

**Suppress Compiler Warnings:** Check this box to suppress compiler warnings. This adds the option W0 to the compiler command line.

**Suppress remark IDs:** Specify one or more remark IDs to suppress. Use a comma to separate IDs.

**Send remarks to a file:** Check this box to send GAP remarks to a specified text file.

**Remarks file:** Specify the filename where GAP remarks will be sent.

**Save these settings as the default (in Tools -> Options for Guided Auto Parallelism):** Check this box to save the specified settings as the default settings.

**Show all GAP configuration and informational dialogs:** Check this box to display this dialog box next time.

When you are done specifying settings, click Run Analysis.

Auto-Parallelization

Using Guided Auto Parallelism

Using Guided Auto Parallelism in Microsoft Visual Studio*

Options: Guided Auto Parallelism dialog box
Options: Converter dialog box

To access the Converter page, click Tools > Options and then select Intel Compilers and Tools > C++ > Converter.

Use the Converter page to specify which platform toolset to use when upgrading an Intel® C++ solution (.icproj) from an older version of Microsoft Visual Studio® to a C++ project supported by Microsoft Visual Studio® 2013 or later (.vcxproj). Once a solution is upgraded, the .icproj file is not used and can be deleted.

Win32: Select the desired compiler version to be used when converting projects based on IA-32 architecture.

X64: Select the desired compiler version to be used when converting projects based on x64 architecture.

Reset All: Click this button to use the default platform toolsets.

Code Coverage dialog box

To access the Code Coverage dialog box, select Tools > Intel Compiler > Code Coverage....

Use the Code Coverage dialog box to set the code coverage feature.

Phase 1 - Instrument: Select this checkbox to compile your code into an instrumented application.

Select the Instrument with guards for threaded application checkbox to produce an instrumented object file that includes the collection of PGO data on applications that use a high level of parallelism.

The compiler option used is shown in Compiler Options.

Deselect the Phase 1 - Instrument checkbox to skip this phase.

Phase 2 - Run Instrumented Application(s): Select this checkbox to run your instrumented application as well as other applications.

You can specify the options to run with the applications by choosing the Application Invocations... button to access the Applications Invocations dialog box.

Deselect the Phase 2 - Run Instrumented Application(s) checkbox to skip this phase.

Phase 3 - Generate Report: Select this checkbox to generate a report with the results of running the instrumented application.

Choose the Settings... button to access the Code Coverage Settings dialog box to configure the settings.

Profile Directory: Where the profile is stored.

Browse: Button to browse for the profile directory.

Show this dialog next time: Choose this button to access the dialog box when you run profile guided optimization.

Save Settings: Choose this button to save your settings.

Run: Choose this button to start the profile guided optimization.

Cancel: Choose this button to close this dialog box without starting the profile guided optimization.

Options: Optimization Reports dialog box

To access the Optimization Reports page, click Tools > Options and then select Intel Compilers and Tools > Optimization Reports. Use this page to specify how you want optimization reporting to appear. This page, in conjunction with the Diagnostics property page for your project or solution, defines settings for optimization report viewing in Visual Studio*.

General

Always Show Compiler Inline Report: Specify if the Compiler Inline Report appears after building or rebuilding your solution or project when inline diagnostics are present.

Always Show Compiler Optimization Report: Specify if Compiler Optimization Report appears after building or rebuilding your solution or project when optimization diagnostics are present. This option has higher priority than Always Show Compiler Inline Report. If both options are set to True, then this window has focus by default.

Show Optimization Notes in Text Editor Margin: Specify if optimization notes appear in the editor as source code annotations.

Optimization Notes in Text Editor

Collapse by Default: Specify if optimization notes appear expanded or collapsed by default.

Show Optimization Notes: Specify if source code annotations appear in the editor.

Site: Specify where optimization notes appear in the editor. Select from one of the following options:

- Caller Site
- Callee Site
- Caller Site and Callee Site

Optimization Reports: Enabling in Visual Studio*

Using Xcode* (macOS*)

Creating an Xcode* Project

The following topic applies to Xcode*.

To create a new Xcode* project:

1. Launch the Xcode* application.
2. Select File > New > Project...
   The Choose a template for your new project window opens.
3. In the left pane, select macOS* > Application.
4. Select a template, for example: Command Line Tool, and click Next.
5. Name your project, for example: Hello World, then enter a string for the Organization Name and Organization Identifier and select a language. Click Next.
6. Specify a directory for your project, and optionally select Create local git repository for this project to place your project under version control.
7. Click Create.

Xcode* creates the named project directory, with an .xcodeproj extension. Your new project directory contains a main.cpp source file and other project files.
Each Xcode* project has its own Project Editor window that displays project source files, targets, and executables.

See Also

Selecting the Intel® Compiler

The following topic applies to Xcode*.

To select the Intel® C++ Compiler:

1. Select the target you want to change and click Build Rules.
2. Add a new rule by clicking Editor > Add Build Rule or pressing the + button.
3. Under Process, choose C source files or C++ source files, depending on your source files.
4. Under Using, select one of the options for the ICC Intel® C++ Compiler:
   - **Major_Version**, such as 19.0: The most recently installed compiler, even if it is not the latest release.
   - **Latest Release**: The latest released compiler available on your system. This is useful when you have multiple installations of the Intel compiler and want to use the version most recently released by Intel.
   - **Major_Version.n.nnn**: A specific package, such as 19.0.0.000. This is useful when you have multiple packages of one major version installed.

**NOTE** If the Intel® Compiler does not show up in the drop-down list, it may mean that the compiler does not support your version of Xcode*. To enable the Intel® Compiler in Xcode* specify the Xcode path during installation and restart the program. The installer checks for the supported Xcode* version and warns you in the case of an unsupported version.

**NOTE**
If you select a tool that does not support the source file type, that source file type is processed by a later rule that specifies that type. For example, even though Objective-C/C++ sources are derived from C sources, they are built by the Intel® C++ Compilers.

Setting Compiler Options

Building the Target

The following topic applies to Xcode*.

A single project can contain multiple targets. The active target determines how your project is built. This topic describes how to build the target using the Xcode* IDE and documents the build steps using the xcodebuild command line utility.

**NOTE** Starting with the 19.0 release of the Intel® C++ Compiler, macOS* 32-bit applications are no longer supported. If you want to compile 32-bit applications, you must use an earlier version of the compiler and you must use Xcode* 9.4 or earlier.

**Building Using the Xcode* IDE**

1. Select the target in the project editor under Targets.
2. Select Product > Build.
3. To view the results of your build, click the Log Navigator button.

You can change the compilation order of the files in an Xcode* target. To re-order the files listed under a target’s Compile Sources, click a source file and drag it before, or after other compilations.

**Building From the Command Line Using the xcodebuild Utility**

You can use the xcodebuild utility to build a target. This utility uses the Xcode* project settings to build target projects from the command line. If you have previously configured your Xcode* project to build with the Intel compiler, xcodebuild invokes it from the command line.

To build from the command line:

1. Check that the Xcode* project is configured to use the Intel® C++ Compiler.
2. Launch a terminal window from the finder by selecting Applications > Utilities > Terminal.
3. Change directories to the directory containing the Xcode* project file (.xcodeproj).
4. If you have multiple versions of Xcode*, use the xcode-select utility to verify the current Xcode* version.
5. Issue an xcodebuild command. For example:

   xcodebuild -project HelloWorld.xcodeproj -target HelloWorld -configuration Debug

6. Run the program built in the example from the previous step by entering the following:

   ./build/Debug/HelloWorld

For more information, refer to the xcodebuild man page.

**Setting the Executable’s Architecture**

Before building a 64-bit executable from within Xcode*, you may need to edit the executable’s target architecture. To change the Architectures setting:

1. Click the target you want to change in the project editor under Targets and select the Build Settings tab.
2. Under Architectures, select the desired architecture.

   **NOTE** The Intel® C++ Compiler generates code solely for Intel® architectures.

**Setting Compiler Options**

The following topic applies to Xcode*.

To use the Xcode* environment to set compiler options, including options specific to Intel® architecture:

1. Select a target.
2. Under the Build Settings tab, click All.
3. Scroll down to the list of ICC Intel® C++ Compiler categories.
4. To set an Intel®C++ Compiler option in the Optimization category, scroll down to display Optimization.
5. Select a Setting, such as Enable Interprocedural Optimization for Single File Compilation, and set the option’s state. If the Quick Help inspector is visible, information about the selected option appears under Quick Help.
Tip
Apple* has deprecated the libstdc++ library, make sure you are using the libc++ standard library.

The next time you build your project, the selected options are used in the compilation.

NOTE To view the settings that have changed from the established defaults, select the Levels button under Build Settings.

Running the Executable

The following topic applies to Xcode*.

Once you have built your Xcode* project, click the Run button. The output from the executable is displayed. This button runs the configuration currently associated with the button. Use the Scheme Editor to change the configuration associated with the button.

Tip To open the Scheme Editor, select Product > Scheme... > Edit Scheme...

Using Dynamic Libraries

You can build your Xcode* project with the -shared-intel compiler option to link with the Intel dynamic libraries. Build your project with the -qopenmp or -parallel option to link in libiomp5.dylib. If you do this, you need to set the DYLD_LIBRARY_PATH environment variable in the Xcode* environment.

To add the environment variable:

1. Open the Scheme Editor and select the Run action.
2. On the Arguments tab, under Environment Variables, click the + button.
3. Add DYLD_LIBRARY_PATH. Set the value to the full path to the Intel compiler's /lib directory.

NOTE If you build your project with the -shared-intel, -qopenmp, or -parallel compiler option without setting the DYLD_LIBRARY_PATH environment variable, a library not found error message results at runtime. Depending on your application, the error message may refer to a library other than the one noted in this example:

dyld: Library not loaded: libiomp5.dylib
Referenced from: /Users/test/hello_world
Reason: image not found

Using Intel® Performance Libraries with Xcode*

The following topic applies to C++ for Xcode*.

You can use the Intel® C++ Compiler with the following Intel® Performance Libraries, which may be included as part of the product:

- Intel® Data Analytics Acceleration Library (Intel® DAAL)
- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® Threading Building Blocks (Intel® TBB)
- Intel® Math Kernel Library (Intel® MKL)

To access these libraries in Xcode*, select the target and go to Build Settings > Intel® C++ Compiler Performance Library Build Components.

To use the Intel® Data Analytics Acceleration Library change the Use Intel® Data Analytics Acceleration Library settings as follows:

- **None**: Disables the use of the Intel® DAAL.
- **Use threaded Intel® Data Analytics Acceleration Library**: Links using the threaded version of the library.
- **Use non-threaded Intel® Data Analytics Acceleration Library**: Links using the non-threaded version of the library.

The Use Intel® Threading Building Blocks Library property enables the library and brings in the associated headers.

The Use Intel Integrated Performance Primitives Libraries property provides the following options in a drop-down menu:

- **None**: Disables the use of the Intel® IPP.
- **Use main libraries set**: Uses all the libraries, except the cryptography libraries.
- **Use main libraries and cryptography library**: Uses the cryptography and main libraries.

**NOTE** The cryptography libraries are subject to export laws.

The Use Intel® Math Kernel Library property provides the following options in a drop-down menu:

- **None**: Disables the use of the Intel® MKL.
- **Use threaded Intel® Math Kernel Library**: Links using the threaded version of the library.
- **Use non-threaded Intel® Math Kernel Library**: Links using the non-threaded version of the library.

For more information, see the Intel® DAAL, Intel® TBB, Intel® IPP, and Intel® MKL documentation.

C/C++ Calling Conventions

There are a number of calling conventions that set the rules on how arguments are passed to a function and how the values are returned from the function.

Calling Conventions on Windows*

The following table summarizes the supported calling conventions on Windows*:

<table>
<thead>
<tr>
<th>Calling Convention</th>
<th>Compiler Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__cdecl</td>
<td>/Gd</td>
<td>This is the default calling convention for C/C++ programs. It can be specified on a function with variable arguments.</td>
</tr>
<tr>
<td>__clrcall</td>
<td>none</td>
<td>Calling convention that specifies that a function can only be called from managed code.</td>
</tr>
<tr>
<td>__stdcall</td>
<td>/Gz</td>
<td>Standard calling convention used for Win32 API functions.</td>
</tr>
<tr>
<td>__fastcall</td>
<td>/Gr</td>
<td>Fast calling convention that specifies that arguments are passed in registers rather than on the stack.</td>
</tr>
<tr>
<td>__regcall</td>
<td>/Qregcall</td>
<td>Intel® C++ Compiler calling convention that specifies that as many arguments as possible are passed in registers; likewise, __regcall uses registers whenever possible to return values. This calling convention is ignored if specified on a function with variable arguments.</td>
</tr>
</tbody>
</table>

For more information about the Intel-compatible vector functions ABI, see the article Vector (SIMD) Function ABI at https://software.intel.com/en-us/articles/vector-simd-function-abi.
### Calling Conventions on Linux* and macOS*

The following table summarizes the supported calling conventions on Linux* and macOS*:

<table>
<thead>
<tr>
<th>Calling Convention</th>
<th>Compiler Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>__attribute__((cdecl))</code></td>
<td>none</td>
<td>Default calling convention for C/C++ programs. Can be specified on a function with variable arguments.</td>
</tr>
<tr>
<td><code>__attribute__((stdcall))</code></td>
<td>none</td>
<td>Calling convention that specifies the arguments are passed on the stack. Cannot be specified on a function with variable arguments.</td>
</tr>
<tr>
<td><code>__attribute__((regparm (number)))</code></td>
<td>none</td>
<td>On systems based on IA-32 architecture, the regparm attribute causes the compiler to pass up to number arguments in registers EAX, EDX, and ECX instead of on the stack. Functions that take a variable number of arguments will continue to pass all of their arguments on the stack.</td>
</tr>
<tr>
<td><code>__attribute__((regcall))</code></td>
<td>-regcall</td>
<td>Intel® C++ Compiler calling convention that specifies that as many arguments as possible are passed in registers; likewise, __regcall uses registers whenever possible to return values. This calling convention is ignored if specified on a function with variable arguments.</td>
</tr>
</tbody>
</table>

---

#### Calling Convention

For more information about the GCC vector functions ABI, see the item Libmvec - vector math library document in the GLIBC wiki at sourceware.org.

__thiscall none__

Default calling convention used by C++ member functions that do not use variable arguments.

__vectorcall /Gv__

Calling convention that specifies that a function passing vector type arguments should utilize vector registers.

---

**The __regcall Calling Convention**

The __regcall calling convention is unique to the Intel® C++ Compiler and requires some additional explanation.
To use \texttt{\_\_regcall}, place the keyword before a function declaration. For example:

\begin{verbatim}
\_\_regcall int foo (int i, int j);
// Linux* and macOS*
\_\_attribute__((regcall)) foo (int I, int j);
\end{verbatim}

\section*{Available \_\_regcall Registers}

All registers in a \texttt{\_\_regcall} function can be used for parameter passing/returning a value, except those that are reserved by the compiler. The following table lists the registers that are available in each register class depending on the default ABI for the compilation. The registers are used in the order shown in the table.

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|}
\hline
Register Class / Architecture & IA-32 for Linux* & IA-32 for Windows* & Intel\textsuperscript{\textregistered} 64 for Linux* & Intel\textsuperscript{\textregistered} 64 for Windows* \\
\hline
GPR & EAX, ECX, EDX, EDI, ESI & ECX, EDX, EDI, ESI & RAX, RCX, RDX, RDI, RSI, R8, R9, R10, R11, R12, R14, R15 & RAX, RCX, RDX, RDI, RSI, R8, R9, R11, R12, R14, R15 \\
FP & ST0 & ST0 & ST0 & ST0 \\
MMX & None & None & None & None \\
XMM & XMM0 - XMM7 & XMM0 - XMM7 & XMM0 - XMM15 & XMM0 - XMM15 \\
YMM & YMM0 - YMM7 & YMM0 - YMM7 & YMM0 - YMM15 & YMM0 - YMM15 \\
ZMM & ZMM0 - ZMM7 & ZMM0 - ZMM7 & ZMM0 - YMM15 & ZMM0 - YMM15 \\
\hline
\end{tabular}
\end{table}

\section*{\_\_regcall Data Type Classification}

Parameters and return values for \texttt{\_\_regcall} are classified by data type and are passed in the registers of the classes shown in the following table.

\begin{table}[h]
\centering
\begin{tabular}{|c|c|}
\hline
Type (for both unsigned and signed types) & IA-32 & Intel\textsuperscript{\textregistered} 64 \\
\hline
bool, char, int, enum, \_\_Decimal32, long, pointer & GPR & GPR \\
short, \_\_mmask\{8,16,32,64\} & GPR & GPR \\
long long, \_\_int64 & See Structured Data Type Classification Rules & GPR \\
\_\_Decimal64 & XMM & GPR \\
long double & FP & FP \\
float, double, float128, \_\_Decimal128 & XMM & XMM \\
\hline
\end{tabular}
\end{table}

\textbf{NOTE} All types assigned to XMM, YMM, or ZMM in a non-SSE target are passed in the stack.
### Type (for both unsigned and signed types)

<table>
<thead>
<tr>
<th>IA-32</th>
<th>Intel® 64</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMM</td>
<td>XMM</td>
</tr>
<tr>
<td>YMM</td>
<td>YMM</td>
</tr>
<tr>
<td>ZMM</td>
<td>ZMM</td>
</tr>
</tbody>
</table>

### __regcall Structured Data Type Classification Rules

Structures/unions and complex types are classified similarly to what is described in the x86_64 ABI, with the following exceptions:

- There is no limitation on the overall size of a structure.
- The register classes for basic types are given in Data Type Classifications.
- For systems based on the IA-32 architecture, classification is performed on four-bytes. For systems based on other architectures, classification is performed on eight-bytes.

### __regcall Placement in Registers or on the Stack

After the classification described in Data Type Classifications and Structured Data Type Classification Rules, __regcall__ parameters and return values are either put into registers specified in Available Registers or placed in memory, according to the following:

- Each chunk (eight bytes on systems based on Intel® 64 architecture or four-bytes on systems based on IA-32 architecture) of a value of Data Type is assigned a register class. If enough registers from Available Registers are available, the whole value is passed in registers, otherwise the value is passed using the stack.
- If the classification were to use one or more register classes, then the registers of these classes from the table in Available Registers are used, in the order given there.
- If no more registers are available in one of the required register classes, then the whole value is put on the stack.

### __regcall Registers that Preserve Their Values

The following registers preserve their values across a __regcall__ call, as long as they were not used for passing a parameter or returning a value:

- GPR

---

**NOTE** For the purpose of structured types, the classification of GPR class is used.

**NOTE** On systems based on IA-32 architecture, these 64-bit integer types (long long, __int64) get classified to the GPR class and are passed in two registers, as if they were implemented as a structure of two 32-bit integer fields.
<table>
<thead>
<tr>
<th>Register Class/ABI</th>
<th>IA-32</th>
<th>Intel® 64 for Linux*</th>
<th>Intel® 64 for Windows*</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPR</td>
<td>ESI, EDI, EBX, EBP, ESP</td>
<td>R12 - R15, RBX, RBP, RSP</td>
<td>R12 - R15, RBX, RBP, RSP</td>
</tr>
<tr>
<td>FP</td>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>MMX</td>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>XMM</td>
<td>XMM4 - XMM7</td>
<td>XMM8 - XMM15</td>
<td>XMM8 - XMM15</td>
</tr>
<tr>
<td>YMM</td>
<td>XMM4 - XMM7</td>
<td>XMM8 - XMM15</td>
<td>XMM8 - XMM15</td>
</tr>
<tr>
<td>ZMM</td>
<td>XMM4 - XMM7</td>
<td>XMM8 - XMM15</td>
<td>XMM8 - XMM15</td>
</tr>
</tbody>
</table>

All other registers do not preserve their values across this call.

__regcall Decoration__

Function names used with __regcall are decorated. Specifically, they are prepended with __regcall<n>__ before any further traditional mangling occurs. For example, the function foo is decorated as follows: __regcall4__foo. This helps avoid improper linking with a name following a different calling convention, while allowing the full range of manipulations to be done with foo (such as setting a breakpoint in the debugger). The <n> part of the decoration specifies the version of the _regcall convention in effect (the current convention revision number is 4). In a Microsoft* compatibility environment, C++ name mangling uses the (lower case) letter x to encode revision 4 of the __regcall calling convention.

Available Registers

**Compiler Options**

The Intel® C++ compiler supports many compiler options you can use in your applications.

In this section, we provide the following:
- Lists of new options and lists of deprecated or removed options
- An alphabetical list of compiler options that includes their short descriptions
- General rules for compiler options and the conventions we use when referring to options
- Details about what appears in the compiler option descriptions
- A description of each compiler option. The descriptions appear under the option’s functional category. Within each category, the options are listed in alphabetical order.

**New Options**

This topic lists the options or option settings that provide new functionality in this release.

If no label appears, the option is available on all supported systems.

If "only" appears in the label, the option is only available on the identified system.

For more details on the options, refer to the individual option descriptions.

For information on conventions used in this table, see Notational Conventions.
New compiler options or option settings are listed in tables below:

- The first table lists new options or option settings that are available on Windows* systems.
- The second table lists new options or option settings that are available on Linux* and macOS* systems. If an option is only available on one of these operating systems, it is labeled.

<table>
<thead>
<tr>
<th>Windows* Options</th>

**Optimization Notice**

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

**Alphabetical List of Compiler Options**

The following table lists all the current compiler options in alphabetical order.

A, QA | Specifies an identifier for an assertion.
alias-const, Qalias-const | Determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const.
align | Determines whether variables and arrays are naturally aligned.
ansi-alias, Qansi-alias | Enables or disables the use of ANSI aliasing rules in optimizations.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ansi-alias-check, Qansi-alias-check</td>
<td>Enables or disables the ansi-alias checker.</td>
</tr>
<tr>
<td>ansi</td>
<td>Enables language compatibility with the gcc option ansi.</td>
</tr>
<tr>
<td>arch</td>
<td>Tells the compiler which features it may target, including which instruction sets it may generate.</td>
</tr>
<tr>
<td>auto-ilp32, Qauto-ilp32</td>
<td>Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux* systems) that can be safely shrunk into 32-bit longs.</td>
</tr>
<tr>
<td>auto-p32</td>
<td>Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk to 32-bit pointers.</td>
</tr>
<tr>
<td>ax, Qax</td>
<td>Tells the compiler to generate multiple, feature-specific auto-dispatch code paths for Intel® processors if there is a performance benefit.</td>
</tr>
<tr>
<td>Bdynamic</td>
<td>Enables dynamic linking of libraries at run time.</td>
</tr>
<tr>
<td>bigobj</td>
<td>Increases the number of sections that an object file can contain.</td>
</tr>
<tr>
<td>B</td>
<td>Specifies a directory that can be used to find include files, libraries, and executables.</td>
</tr>
<tr>
<td>Bstatic</td>
<td>Enables static linking of a user’s library.</td>
</tr>
<tr>
<td>Bsymbolic</td>
<td>Binds references to all global symbols in a program to the definitions within a user’s shared library.</td>
</tr>
<tr>
<td>Bsymbolic-functions</td>
<td>Binds references to all global function symbols in a program to the definitions within a user’s shared library.</td>
</tr>
<tr>
<td>check-pointers, Qcheck-pointers</td>
<td>Determines whether the compiler checks bounds for memory access through pointers.</td>
</tr>
<tr>
<td>check-pointers-dangling, Qcheck-pointers-dangling</td>
<td>Determines whether the compiler checks for dangling pointer references.</td>
</tr>
<tr>
<td>check-pointers-mpx, Qcheck-pointers-mpx</td>
<td>Determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® Memory Protection Extensions (Intel® MPX).</td>
</tr>
<tr>
<td>check-pointers-narrowing, Qcheck-pointers-narrowing</td>
<td>Determines whether the compiler enables or disables the narrowing of pointers to structure fields.</td>
</tr>
<tr>
<td>check-pointers-undimensioned, Qcheck-pointers-undimensioned</td>
<td>Determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.</td>
</tr>
<tr>
<td>cilk-serialize, Qcilk-serialize</td>
<td>Causes serialization of Intel® Cilk™ Plus code. This is a deprecated option. There is no replacement option.</td>
</tr>
<tr>
<td>clang-name</td>
<td>Specifies the name of the Clang compiler that should be used to set up the environment for C compilations.</td>
</tr>
<tr>
<td>clangxx-name</td>
<td>Specifies the name of the Clang++ compiler that should be used to set up the environment for C++ compilations.</td>
</tr>
<tr>
<td>complex-limited-range, Qcomplex-limited-range</td>
<td>Determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.</td>
</tr>
<tr>
<td>C</td>
<td>Places comments in preprocessed source output.</td>
</tr>
</tbody>
</table>
c
Prevents linking.

cxxlib
Determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.

daal, Qdaal
Tells the compiler to link to certain libraries in the Intel® Data Analytics Acceleration Library (Intel® DAAL).

dD, QdD
Same as option -dM, but outputs #define directives in preprocessed source.

D
Defines a macro name that can be associated with an optional value.

debug (Linux* and macOS*)
Enables or disables generation of debugging information.

debug (Windows*)
Enables or disables generation of debugging information.

diag, Qdiag
Controls the display of diagnostic information during compilation.

diag-dump, Qdiag-dump
Tells the compiler to print all enabled diagnostic messages.

diag-enable=power, Qdiag-enable:power
Controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.

diag-error-limit, Qdiag-error-limit
Specifies the maximum number of errors allowed before compilation stops.

diag-file, Qdiag-file
Causes the results of diagnostic analysis to be output to a file.

diag-file-append, Qdiag-file-append
Causes the results of diagnostic analysis to be appended to a file.

diag-id-numbers, Qdiag-id-numbers
Determines whether the compiler displays diagnostic messages by using their ID number values.

diag-once, Qdiag-once
Tells the compiler to issue one or more diagnostic messages only once.

dM, QdM
Tells the compiler to output macro definitions in effect after preprocessing.

dN, QdN
Same as option -dD, but output #define directives contain only macro names.

dryrun
Specifies that driver tool commands should be shown but not executed.
dumpmachine
Displays the target machine and operating system configuration.
dumpversion
Displays the version number of the compiler.
dynamiclib
Invokes the libtool command to generate dynamic libraries.
dynamic-linker
Specifies a dynamic linker other than the default.
early-template-check
Lets you semantically check template function template prototypes before instantiation.

E
Causes the preprocessor to send output to stdout.

EH
Specifies the model of exception handling to be performed.

EP
Causes the preprocessor to send output to stdout, omitting #line directives.

F ( macOS* )
Adds a framework directory to the head of an include file search path.

F (Windows*)
Specifies the stack reserve amount for the program.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fabi-version</td>
<td>Instructs the compiler to select a specific ABI implementation.</td>
</tr>
<tr>
<td>falias, Oa</td>
<td>Determines whether aliasing is assumed in a program.</td>
</tr>
<tr>
<td>falign-functions, Qfnalign</td>
<td>Tells the compiler to align functions on an optimal byte boundary.</td>
</tr>
<tr>
<td>falign-loops, Qalign-loops</td>
<td>Aligns loops to a power-of-two byte boundary.</td>
</tr>
<tr>
<td>falign-stack</td>
<td>Tells the compiler the stack alignment to use on entry to routines.</td>
</tr>
<tr>
<td>fargument-alias, Qalias-args</td>
<td>Determines whether function arguments can alias each other.</td>
</tr>
<tr>
<td>fargument-noalias-global</td>
<td>Tells the compiler that function arguments cannot alias each other and cannot alias global storage.</td>
</tr>
<tr>
<td>fasm-blocks</td>
<td>Enables the use of blocks and entire functions of assembly code within a C or C++ file.</td>
</tr>
<tr>
<td>Fa</td>
<td>Specifies that an assembly listing file should be generated.</td>
</tr>
<tr>
<td>FA</td>
<td>Specifies the contents of an assembly listing file.</td>
</tr>
<tr>
<td>fast</td>
<td>Maximizes speed across the entire program.</td>
</tr>
<tr>
<td>fast-transcendentals, Qfast-transcendentals</td>
<td>Enables the compiler to replace calls to transcendental functions with faster but less precise implementations.</td>
</tr>
<tr>
<td>fasynchronous-unwind-tables</td>
<td>Determines whether unwind information is precise at an instruction boundary or at a call boundary.</td>
</tr>
<tr>
<td>fblocks</td>
<td>Determines whether Apple* blocks are enabled or disabled.</td>
</tr>
<tr>
<td>fbuiltin, Oi</td>
<td>Enables or disables inline expansion of intrinsic functions.</td>
</tr>
<tr>
<td>FC</td>
<td>Displays the full path of source files passed to the compiler in diagnostics.</td>
</tr>
<tr>
<td>fcode-asm</td>
<td>Produces an assembly listing with machine code annotations.</td>
</tr>
<tr>
<td>fcommon</td>
<td>Determines whether the compiler treats common symbols as global definitions.</td>
</tr>
<tr>
<td>fdefer-pop</td>
<td>Determines whether the compiler always pops the arguments to each function call as soon as that function returns.</td>
</tr>
<tr>
<td>FD</td>
<td>Generates file dependencies related to the Microsoft* C/C++ compiler.</td>
</tr>
<tr>
<td>Fd</td>
<td>Lets you specify a name for a program database (PDB) file created by the compiler.</td>
</tr>
<tr>
<td>feliminate-unused-debug-types, Qeliminate-unused-debug-types</td>
<td>Controls the debug information emitted for types declared in a compilation unit.</td>
</tr>
<tr>
<td>femit-class-debug-always</td>
<td>Controls the format and size of debug information generated by the compiler for C++ classes.</td>
</tr>
<tr>
<td>Fe</td>
<td>Specifies the name for a built program or dynamic-link library.</td>
</tr>
<tr>
<td>fexceptions</td>
<td>Enables exception handling table generation.</td>
</tr>
<tr>
<td>fextend-arguments, Qextend-arguments</td>
<td>Controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.</td>
</tr>
<tr>
<td>ffat-lto-objects</td>
<td>Determines whether a fat link-time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (-c -ipo).</td>
</tr>
</tbody>
</table>

**ffnalias, Ow**
Determines whether aliasing is assumed within functions.

**ffreestanding, Qfreestanding**
Ensures that compilation takes place in a freestanding environment.

**ffriend-injection**
Causes the compiler to inject friend functions into the enclosing namespace.

**ffunction-sections**
Places each function in its own COMDAT section.

**fgnu89-inline**
Tells the compiler to use C89 semantics for inline functions when in C99 mode.

**fimf-absolute-error, Qimf-absolute-error**
 Defines the maximum allowable absolute error for math library function results.

**fimf-accuracy-bits, Qimf-accuracy-bits**
 Defines the relative error for math library function results, including division and square root.

**fimf-arch-consistency, Qimf-arch-consistency**
 Ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture.

**fimf-domain-exclusion, Qimf-domain-exclusion**
Indicates the input arguments domain on which math functions must provide correct results.

**fimf-force-dynamic-target, Qimf-force-dynamic-target**
Instructs the compiler to use run-time dispatch in calls to math functions.

**fimf-max-error, Qimf-max-error**
 Defines the maximum allowable relative error for math library function results, including division and square root.

**fimf-precision, Qimf-precision**
Lets you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.

**fimf-use-svml, Qimf-use-svml**
Instructs the compiler to use the Short Vector Math Library (SVML) rather than the Intel® Math Library (LIBM) to implement math library functions.

**finline-functions**
Enables function inlining for single file compilation.

**finline-limit**
Lets you specify the maximum size of a function to be inlined.

**finline**
Tells the compiler to inline functions declared with __inline and perform C++ inlining.

**finstrument-functions, Qinstrument-functions**
Determines whether function entry and exit points are instrumented.

**FI**
Tells the preprocessor to include a specified file name as the header file.

**fixed**
Causes the linker to create a program that can be loaded only at its preferred base address.

**fjump-tables**
Determines whether jump tables are generated for switch statements.

**fkeep-static-consts, Qkeep-static-consts**
Tells the compiler to preserve allocation of variables that are not referenced in the source.

**fma, Qfma**
Determines whether the compiler generates fused multiply-add (FMA) instructions if such instructions exist on the target processor.

**fmath-errno**
Tells the compiler that errno can be reliably tested after calls to standard math library functions.

**fmerge-constants**
Determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units.
fmerge-debug-strings
Causes the compiler to pool strings used in debugging information.

fminshared
Specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.

fmpc-privatize
Enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.

fms-dialect
Enables support for a language dialect that is compatible with Microsoft* Windows, while maintaining link compatibility with gcc.

Fm
Tells the linker to generate a link map file. This is a deprecated option. There is no replacement option.

fmudflap
The compiler instruments risky pointer operations to prevent buffer overflows and invalid heap use. This is a deprecated option. There is no replacement option. You can consider using the Pointer Checker options (such as option -check-pointers).

fno-gnu-keywords
Tells the compiler to not recognize typeof as a keyword.

fno-implicit-inline-templates
Tells the compiler to not emit code for implicit instantiations of inline templates.

fno-implicit-templates
Tells the compiler to not emit code for non-inline templates that are instantiated implicitly.

fnon-call-exceptions
Allows trapping instructions to throw C++ exceptions.

fnon-lvalue-assign
Determines whether casts and conditional expressions can be used as lvalues.

fno-operator-names
Disables support for the operator names specified in the standard.

fno-rtti
Disables support for run-time type information (RTTI).

fnsplit, Qfnsplit
Enables function splitting.

fomit-frame-pointer, Qy
Determines whether EBP is used as a general-purpose register in optimizations.

foptimize-sibling-calls
Determines whether the compiler optimizes tail recursive calls.

Fo
Specifies the name for an object file.

fpack-struct
Specifies that structure members should be packed together.

fpascal-strings
Tells the compiler to allow for Pascal-style string literals.

fpermissive
Tells the compiler to allow for non-conformant code.

fpic
Determines whether the compiler generates position-independent code.

fpie
Tells the compiler to generate position-independent code. The generated code can only be linked into executables.

Fp
Lets you specify an alternate path or file name for precompiled header files.

fp-model, fp
Controls the semantics of floating-point calculations.

fp-port, Qfp-port
Rounds floating-point results after floating-point operations.

fprotect-parens, Qfprotect-parens
Determines whether the optimizer honors parentheses when floating-point expressions are evaluated.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fp-speculation</strong>, <strong>Qfp-speculation</strong></td>
<td>Tells the compiler the mode in which to speculate on floating-point operations.</td>
</tr>
<tr>
<td><strong>fp-stack-check</strong>, <strong>Qfp-stack-check</strong></td>
<td>Tells the compiler to generate extra code after every function call to ensure that the floating-point stack is in the expected state.</td>
</tr>
<tr>
<td><strong>fp-trap</strong>, <strong>Qfp-trap</strong></td>
<td>Sets the floating-point trapping mode for the main routine.</td>
</tr>
<tr>
<td><strong>fp-trap-all</strong>, <strong>Qfp-trap-all</strong></td>
<td>Sets the floating-point trapping mode for all routines.</td>
</tr>
<tr>
<td><strong>freg-struct-return</strong></td>
<td>Tells the compiler to return struct and union values in registers when possible.</td>
</tr>
<tr>
<td><strong>FR</strong></td>
<td>Invokes the Microsoft C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.</td>
</tr>
<tr>
<td><strong>fshort-enums</strong></td>
<td>Tells the compiler to allocate as many bytes as needed for enumerated types.</td>
</tr>
<tr>
<td><strong>fsource-asm</strong></td>
<td>Produces an assembly listing with source code annotations.</td>
</tr>
<tr>
<td><strong>fstack-protector</strong></td>
<td>Enables or disables stack overflow security checks for certain (or all) routines.</td>
</tr>
<tr>
<td><strong>fstack-security-check</strong></td>
<td>Determines whether the compiler generates code that detects some buffer overruns.</td>
</tr>
<tr>
<td><strong>fsyntax-only</strong></td>
<td>Tells the compiler to check only for correct syntax.</td>
</tr>
<tr>
<td><strong>ftemplate-depth</strong>, <strong>Qtemplate-depth</strong></td>
<td>Control the depth in which recursive templates are expanded.</td>
</tr>
<tr>
<td><strong>ftls-model</strong></td>
<td>Changes the thread local storage (TLS) model.</td>
</tr>
<tr>
<td><strong>ftrapuv</strong>, <strong>Qtrapuv</strong></td>
<td>Initializes stack local variables to an unusual value to aid error detection.</td>
</tr>
<tr>
<td><strong>ftz</strong>, <strong>Qftz</strong></td>
<td>Flushes denormal results to zero.</td>
</tr>
<tr>
<td><strong>funroll-all-loops</strong></td>
<td>Unroll all loops even if the number of iterations is uncertain when the loop is entered.</td>
</tr>
<tr>
<td><strong>funsigned-bitfields</strong></td>
<td>Determines whether the default bitfield type is changed to unsigned.</td>
</tr>
<tr>
<td><strong>funsigned-char</strong></td>
<td>Change default char type to unsigned.</td>
</tr>
<tr>
<td><strong>fuse-ld</strong></td>
<td>Tells the compiler to use a different linker instead of the default linker (ld).</td>
</tr>
<tr>
<td><strong>fverbose-asm</strong></td>
<td>Produces an assembly listing with compiler comments, including options and version information.</td>
</tr>
<tr>
<td><strong>fvisibility-inlines-hidden</strong></td>
<td>Causes inline member functions (those defined in the class declaration) to be marked hidden.</td>
</tr>
<tr>
<td><strong>fvisibility</strong></td>
<td>Specifies the default visibility for global symbols or the visibility for symbols in a file.</td>
</tr>
<tr>
<td><strong>fzero-initialized-in-bss</strong>, <strong>Qzero-initialized-in-bss</strong></td>
<td>Determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.</td>
</tr>
<tr>
<td><strong>GA</strong></td>
<td>Enables faster access to certain thread-local storage (TLS) variables.</td>
</tr>
<tr>
<td><strong>gcc</strong>, <strong>gcc-sys</strong></td>
<td>Determines whether certain GNU macros are defined or undefined.</td>
</tr>
<tr>
<td><strong>gcc-include-dir</strong></td>
<td>Controls whether the gcc-specific include directory is put into the system include path.</td>
</tr>
</tbody>
</table>
gcc-name

Let you specify the name of the gcc compiler that should be used to set up the environment for C compilations.

Gd

Makes __cdecl the default calling convention.

gdwarf

Let you specify a DWARF Version format when generating debug information.

Ge

Enables stack-checking for all functions. This is a deprecated option. The replacement option is /Gs0.

Gf

Enables read/write string-pooling optimization. This is a deprecated option. The replacement option is /GF.

GF

Enables read-only string-pooling optimization.

Gh

Calls a function to aid custom user profiling.

GH

Calls a function to aid custom user profiling.

global-hoist, Qglobal-hoist

Enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source.

Gm

Enables a minimal rebuild.

gnu-prefix

Let you specify a prefix that will be added to the names of gnu utilities called from the compiler.

grecord-gcc-switches

Causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.

GR

Enables or disables C++ Run Time Type Information (RTTI).

Gr

Makes __fastcall the default calling convention.

GS

Determines whether the compiler generates code that detects some buffer overruns.

Gs

Lets you control the threshold at which the stack checking routine is called or not called.

gsplit-dwarf

Creates a separate object file containing DWARF debug information.

g

Tells the compiler to generate a level of debugging information in the object file.

GT

Enables fiber-safe thread-local storage of data.

guard

Enables the control flow protection mechanism.

guide, Qguide

Lets you set a level of guidance for auto-vectorization, auto parallelism, and data transformation.

guide-data-trans, Qguide-data-trans

Lets you set a level of guidance for data transformation.

guide-file, Qguide-file

Causes the results of guided auto parallelism to be output to a file.

guide-file-append, Qguide-file-append

Causes the results of guided auto parallelism to be appended to a file.

guide-opts, Qguide-opts

Tells the compiler to analyze certain code and generate recommendations that may improve optimizations.

guide-par, Qguide-par

Lets you set a level of guidance for auto parallelism.
guide-profile, Qguide-profile
Specifies a loop profiler data file (or a set of files) when used with option -guide or /Qguide.

guide-vec, Qguide-vec
Lets you set a level of guidance for auto-vectorization.

Gv
Tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.

gxx-name
Lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations.

Gy
Separates functions into COMDATs for the linker. This is a deprecated option. There is no replacement option.

GZ
Initializes all local variables. This is a deprecated option. The replacement option is /RTC1.

Gz
Makes __stdcall the default calling convention.

H, QH
Tells the compiler to display the include file order and continue compilation.

H (Windows*)
Causes the compiler to limit the length of external symbol names. This is a deprecated option. There is no replacement option.

help
Displays all available compiler options or a category of compiler options.

help-pragma, Qhelp-pragma
Displays all supported pragmas.

homeparams
Tells the compiler to store parameters passed in registers to the stack.

hotpatch
Tells the compiler to prepare a routine for hotpatching.

icc, Qicl
Determines whether certain Intel compiler macros are defined or undefined.

idirafter
Adds a directory to the second include file search path.

imacros
Allows a header to be specified that is included in front of the other headers in the translation unit.

inline-calloc, Qinline-calloc
Tells the compiler to inline calls to calloc() as calls to malloc() and memset().

inline-factor, Qinline-factor
Specifies the percentage multiplier that should be applied to all inlining options that define upper limits.

inline-forceinline, Qinline-forceinline
Instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.

inline-level, Ob
Specifies the level of inline function expansion.

inline-max-per-compile, Qinline-max-per-compile
Specifies the maximum number of times inlining may be applied to an entire compilation unit.

inline-max-per-routine, Qinline-max-per-routine
Specifies the maximum number of times the inliner may inline into a particular routine.

inline-max-size, Qinline-max-size
Specifies the lower limit for the size of what the inliner considers to be a large routine.

inline-max-total-size, Qinline-max-total-size
Specifies how much larger a routine can normally grow when inline expansion is performed.
### Compiler Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline-min-callergrowth, Qinline-min-callergrowth</td>
<td>Lets you specify a function size ( n ) for which functions of size ( \leq n ) do not contribute to the estimated growth of the caller when inlined.</td>
</tr>
<tr>
<td>inline-min-size, Qinline-min-size</td>
<td>Specifies the upper limit for the size of what the inliner considers to be a small routine.</td>
</tr>
<tr>
<td>intel-extensions, Qinintel-extensions</td>
<td>Enables or disables all Intel® C and Intel® C++ language extensions.</td>
</tr>
<tr>
<td>intel-freestanding</td>
<td>Lets you compile in the absence of a gcc environment.</td>
</tr>
<tr>
<td>intel-freestanding-target-os</td>
<td>Lets you specify the target operating system for compilation.</td>
</tr>
<tr>
<td>ip, Qip</td>
<td>Determines whether additional interprocedural optimizations for single-file compilation are enabled.</td>
</tr>
<tr>
<td>ip-no-inlining, Qinip-no-inlining</td>
<td>Disables full and partial inlining enabled by interprocedural optimization options.</td>
</tr>
<tr>
<td>ip-no-pinlining, Qinip-no-pinlining</td>
<td>Disables partial inlining enabled by interprocedural optimization options.</td>
</tr>
<tr>
<td>ipo, Qipo</td>
<td>Enables interprocedural optimization between files.</td>
</tr>
<tr>
<td>ipo-c, Qinipo-c</td>
<td>Tells the compiler to optimize across multiple files and generate a single object file.</td>
</tr>
<tr>
<td>ipo-jobs, Qinipo-jobs</td>
<td>Specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO).</td>
</tr>
<tr>
<td>ipo-S, Qinipo-S</td>
<td>Tells the compiler to optimize across multiple files and generate a single assembly file.</td>
</tr>
<tr>
<td>ipo-separate, Qinipo-separate</td>
<td>Tells the compiler to generate one object file for every source file.</td>
</tr>
<tr>
<td>ipp, Qinipp</td>
<td>Tells the compiler to link to the some or all of the Intel® Integrated Performance Primitives (Intel® IPP) libraries.</td>
</tr>
<tr>
<td>ipp-link, Qinipp-link</td>
<td>Controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.</td>
</tr>
<tr>
<td>iprefix</td>
<td>Option for indicating the prefix for referencing directories containing header files.</td>
</tr>
<tr>
<td>iquote</td>
<td>Add directory to the front of the include file search path for files included with quotes but not brackets.</td>
</tr>
<tr>
<td>I</td>
<td>Specifies an additional directory to search for include files.</td>
</tr>
<tr>
<td>I-</td>
<td>Splits the include path.</td>
</tr>
<tr>
<td>isystem</td>
<td>Specifies a directory to add to the start of the system include path.</td>
</tr>
<tr>
<td>iwithprefix</td>
<td>Appends a directory to the prefix passed in by -iprefix and puts it on the include search path at the end of the include directories.</td>
</tr>
<tr>
<td>iwithprefixbefore</td>
<td>Similar to -iwithprefix except the include directory is placed in the same place as -I command line include directories.</td>
</tr>
<tr>
<td>J</td>
<td>Sets the default character type to unsigned.</td>
</tr>
<tr>
<td>Kc++, TP</td>
<td>Tells the compiler to process all source or unrecognized file types as C++ source files. This is a deprecated option. The replacement option for Kc++ is -x c++; the replacement option for /TP is /Tp&lt;file&gt;.</td>
</tr>
</tbody>
</table>
LD
  Specifies that a program should be linked as a dynamic-link (DLL) library.

link
  Passes user-specified options directly to the linker at compile time.

I
  Tells the linker to search for a specified library when linking.

L
  Tells the linker to search for libraries in a specified directory before
  searching the standard directories.

M, QM
  Tells the compiler to generate makefile dependency lines for each source
  file.

m32, m64, Qm32, Qm64
  Tells the compiler to generate code for a specific architecture.

m80387
  Specifies whether the compiler can use x87 instructions.

malign-double
  Determines whether double, long double, and long long types are
  naturally aligned. This option is equivalent to specifying option align.

malign-mac68k
  Aligns structure fields on 2-byte boundaries (m68k compatible).

malign-natural
  Aligns larger types on natural size-based boundaries (overrides ABI).

malign-power
  Aligns based on ABI-specified alignment rules.

map-opts, Qmap-opts
  Maps one or more compiler options to their equivalent on a different
  operating system.

march
  Tells the compiler to generate code for processors that support certain
  features.

masm
  Tells the compiler to generate the assembler output file using a selected
  dialect.

mcmodel
  Tells the compiler to use a specific memory model to generate code and
  store data.

mconditional-branch,
Qconditional-branch
  Lets you identify and fix code that may be vulnerable to speculative
  execution side-channel attacks, which can leak your secure data as a
  result of bad speculation of a conditional branch direction.

MD, QMD
  Preprocess and compile, generating output file containing dependency
  information ending with extension .d.

MD
  Tells the linker to search for unresolved references in a multithreaded,
  dynamic-link run-time library.

mdynamic-no-pic
  Generates code that is not position-independent but has position-
  independent external references.

MF, QMF
  Tells the compiler to generate makefile dependency information in a file.

MG, QMG
  Tells the compiler to generate makefile dependency lines for each source
  file.

minstruction, Qinstruction
  Determines whether MOVBE instructions are generated for certain Intel
  processors.

mkl, Qmkl
  Tells the compiler to link to certain libraries in the Intel® Math Kernel
  Library (Intel® MKL). On Windows systems, you must specify this option
  at compile time.

mlong-double
  Lets you override the default configuration of the long double data type.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MM, QMM</td>
<td>Tells the compiler to generate makefile dependency lines for each source file.</td>
</tr>
<tr>
<td>MMD, QMMD</td>
<td>Tells the compiler to generate an output file containing dependency information.</td>
</tr>
<tr>
<td>momit-leaf-frame-pointer</td>
<td>Determines whether the frame pointer is omitted or kept in leaf functions.</td>
</tr>
<tr>
<td>mp1, Qprec</td>
<td>Improves floating-point precision and consistency.</td>
</tr>
<tr>
<td>MP-force</td>
<td>Disables the default heuristics used when compiler option /MP is specified. This lets you control the number of processes spawned.</td>
</tr>
<tr>
<td>MP</td>
<td>Tells the compiler to add a phony target for each dependency.</td>
</tr>
<tr>
<td>MQ</td>
<td>Changes the default target rule for dependency generation.</td>
</tr>
<tr>
<td>mregparm</td>
<td>Lets you control the number registers used to pass integer arguments.</td>
</tr>
<tr>
<td>mregparm-version</td>
<td>Determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention.</td>
</tr>
<tr>
<td>mstringop-inline-threshold, Qstringop-inline-threshold</td>
<td>Tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified value.</td>
</tr>
<tr>
<td>mstringop-strategy, Qstringop-strategy</td>
<td>Lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.</td>
</tr>
<tr>
<td>MT, QMT</td>
<td>Changes the default target rule for dependency generation.</td>
</tr>
<tr>
<td>m</td>
<td>Tells the compiler which features it may target, including which instruction sets it may generate.</td>
</tr>
<tr>
<td>MT</td>
<td>Tells the linker to search for unresolved references in a multithreaded, static run-time library.</td>
</tr>
<tr>
<td>mtune, tune</td>
<td>Performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike -march).</td>
</tr>
<tr>
<td>multibyte-chars, Qmultibyte-chars</td>
<td>Determines whether multi-byte characters are supported.</td>
</tr>
<tr>
<td>multiple-processes, MP</td>
<td>Creates multiple processes that can be used to compile large numbers of source files at the same time.</td>
</tr>
<tr>
<td>noBool</td>
<td>Disables the bool keyword.</td>
</tr>
<tr>
<td>no-bss-init, Qnobss-init</td>
<td>Tells the compiler to place in the DATA section any uninitialized variables and explicitly zero-initialized variables.</td>
</tr>
<tr>
<td>nodefaultlibs</td>
<td>Prevents the compiler from using standard libraries when linking.</td>
</tr>
<tr>
<td>no-libgcc</td>
<td>Prevents the linking of certain gcc-specific libraries.</td>
</tr>
<tr>
<td>noib-inlinel</td>
<td>Disables inline expansion of standard library or intrinsic functions.</td>
</tr>
<tr>
<td>nologo</td>
<td>Tells the compiler to not display compiler version information.</td>
</tr>
<tr>
<td>nostartfiles</td>
<td>Prevents the compiler from using standard startup files when linking.</td>
</tr>
<tr>
<td>nostdinc++</td>
<td>Do not search for header files in the standard directories for C++, but search the other standard directories.</td>
</tr>
</tbody>
</table>
nostdlib Prevents the compiler from using standard libraries and startup files when linking.

Od Disables all optimizations.

Ofast Sets certain aggressive options to improve the speed of your application.

Os Enables optimizations that do not increase code size; it produces smaller code size than O2.

O Specifies the code optimization for applications.

o Specifies the name for an output file.

Ot Enables all speed optimizations.

Ox Enables maximum optimizations.

par-affinity, Qpar-affinity Specifies thread affinity.

parallel, Qparallel Tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.

parallel-source-info, Qparallel-source-info Enables or disables source location emission when OpenMP* or auto-parallelism code is generated.

par-num-threads, Qpar-num-threads Specifies the number of threads to use in a parallel region.

par-runtime-control, Qpar-runtime-control Generates code to perform run-time checks for loops that have symbolic loop bounds.

par-schedule, Qpar-schedule Lets you specify a scheduling algorithm for loop iterations.

par-threshold, Qpar-threshold Sets a threshold for the auto-parallelization of loops.

pc, Qpc Enables control of floating-point significand precision.

pch-create Tells the compiler to create a precompiled header file.

pch-dir Tells the compiler the location for precompiled header files.

pch Tells the compiler to use appropriate precompiled header files.

pch-use Tells the compiler to use a precompiled header file.

p Compiles and links for function profiling with gprof(1).

pdbfile Lets you specify the name for a program database (PDB) file created by the linker.

pie Determines whether the compiler generates position-independent code that will be linked into an executable.

pragma-optimization-level Specifies which interpretation of the optimization_level pragma should be used if no prefix is specified.

prec-div, Qprec-div Improves precision of floating-point divides.

prec-sqrt, Qprec-sqrt Improves precision of square root implementations.

print-multi-lib Prints information about where system libraries should be found.

print-sysroot Prints the target sysroot directory that is used during compilation.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prof-data-order, Qprof-data-order</td>
<td>Enables or disables data ordering if profiling information is enabled.</td>
</tr>
<tr>
<td>prof-dir, Qprof-dir</td>
<td>Specifies a directory for profiling information output files.</td>
</tr>
<tr>
<td>prof-file, Qprof-file</td>
<td>Specifies an alternate file name for the profiling summary files.</td>
</tr>
<tr>
<td>prof-func-groups</td>
<td>Enables or disables function grouping if profiling information is enabled.</td>
</tr>
<tr>
<td>prof-func-order, Qprof-func-order</td>
<td>Enables or disables function ordering if profiling information is enabled.</td>
</tr>
<tr>
<td>prof-gen, Qprof-gen</td>
<td>Produces an instrumented object file that can be used in profile guided optimization.</td>
</tr>
<tr>
<td>prof-gen-sampling</td>
<td>Tells the compiler to generate debug discriminators in debug output. This aids in developing more precise sampled profiling output.</td>
</tr>
<tr>
<td>prof-hotness-threshold, Qprof-hotness-threshold</td>
<td>Lets you set the hotness threshold for function grouping and function ordering.</td>
</tr>
<tr>
<td>profile-functions, Qprofile-functions</td>
<td>Inserts instrumentation calls at a function's entry and exit points.</td>
</tr>
<tr>
<td>profile-loops, Qprofile-loops</td>
<td>Inserts instrumentation calls at a function's entry and exit points, and before and after instrumentable loops.</td>
</tr>
<tr>
<td>profile-loops-report, Qprofile-loops-report</td>
<td>Controls the level of detail for the data collected when instrumentation occurs before and after certain loops.</td>
</tr>
<tr>
<td>prof-src-dir, Qprof-src-dir</td>
<td>Determines whether directory information of the source file under compilation is considered when looking up profile data records.</td>
</tr>
<tr>
<td>prof-src-root, Qprof-src-root</td>
<td>Lets you use relative directory paths when looking up profile data and specifies a directory as the base.</td>
</tr>
<tr>
<td>prof-src-root-cwd, Qprof-src-root-cwd</td>
<td>Lets you use relative directory paths when looking up profile data and specifies the current working directory as the base.</td>
</tr>
<tr>
<td>prof-use, Qprof-use</td>
<td>Enables the use of profiling information during optimization.</td>
</tr>
<tr>
<td>prof-use-sampling</td>
<td>Short Description</td>
</tr>
<tr>
<td>prof-value-profiling, Qprof-value-profiling</td>
<td>Controls which values are value profiled.</td>
</tr>
<tr>
<td>P</td>
<td>Tells the compiler to stop the compilation process and write the results to a file.</td>
</tr>
<tr>
<td>pthread</td>
<td>Tells the compiler to use pthreads library for multithreading support.</td>
</tr>
<tr>
<td>qcf-protection, Qcf-protection</td>
<td>Enables Control-flow Enforcement Technology (CET) protection, which defends your program from certain attacks that exploit vulnerabilities. This option offers preliminary support for CET.</td>
</tr>
<tr>
<td>Qcov-dir</td>
<td>Specifies a directory for profiling information output files that can be used with the codecov or tselect tool.</td>
</tr>
<tr>
<td>Qcov-file</td>
<td>Specifies an alternate file name for the profiling summary files that can be used with the codecov or tselect tool.</td>
</tr>
<tr>
<td>Qcov-gen</td>
<td>Produces an instrumented object file that can be used with the codecov or tselect tool.</td>
</tr>
<tr>
<td>Qcxx-features</td>
<td>Enables standard C++ features without disabling Microsoft features.</td>
</tr>
</tbody>
</table>
Qgcc-dialect

Enables support for a limited gcc-compatible dialect on Windows*.

Qinline-dllimport

Determines whether dllimport functions are inlined.

Qinstall

Specifies the root directory where the compiler installation was performed.

Qlocation

Specifies the directory for supporting tools.

Qlong-double

Changes the default size of the long double data type.

Qms

Tells the compiler to emulate Microsoft compatibility bugs.

qoffload, Qoffload

Lets you specify the mode for offloading or tell the compiler to ignore language constructs for offloading. This option only applies when targeting Intel® Xeon Phi™ products. This is a deprecated option. There is no replacement option.

qoffload-arch, Qoffload-arch

Lets you specify the target architecture to use when offloading code. This option only applies when targeting Intel® Xeon Phi™ products.

qoffload-attribute-target, Qoffload-attribute-target

Causes the compiler to flag file-scope functions and data objects in the source file with the offload attribute target(mic). This option only applies when targeting Intel® Xeon Phi™ products. This is a deprecated option. There is no replacement option.

qoffload-option, Qoffload-option

Lets you explicitly specify options to be used for the specified target and tool. This option only applies when targeting Intel® Xeon Phi™ products.

qopenmp, Qopenmp

Enables the parallelizer to generate multi-threaded code based on OpenMP* directives.

qopenmp-lib, Qopenmp-lib

Lets you specify an OpenMP* run-time library to use for linking.

qopenmp-link

Controls whether the compiler links to static or dynamic OpenMP* run-time libraries.

qopenmp-offload, Qopenmp-offload

Enables or disables OpenMP* offloading compilation for the target pragmas. This option only applies when targeting Intel® Xeon Phi™ products.

qopenmp-simd, Qopenmp-simd

Enables or disables OpenMP* SIMD compilation.

qopenmp-stubs, Qopenmp-stubs

Enables compilation of OpenMP* programs in sequential mode.

qopenmp-threadprivate, Qopenmp-threadprivate

Lets you specify an OpenMP* threadprivate implementation.

qopt-args-in-regs, Qopt-args-in-regs

Determines whether calls to routines are optimized by passing parameters in registers instead of on the stack.

qopt-assume-safe-padding, Qopt-assume-safe-padding

Determines whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.

qopt-block-factor, Qopt-block-factor

Lets you specify a loop blocking factor.

qopt-calloc

Tells the compiler to substitute a call to _intel_fast_calloc() for a call to calloc().

qopt-class-analysis, Qopt-class-analysis

Determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time.
<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>qopt-dynamic-align</td>
<td>Enables or disables dynamic data alignment optimizations.</td>
</tr>
<tr>
<td>qopt-jump-tables</td>
<td>Enables or disables generation of jump tables for switch statements.</td>
</tr>
<tr>
<td>qopt-malloc-options</td>
<td>Lets you specify an alternate algorithm for malloc().</td>
</tr>
<tr>
<td>qopt-matmul, Qopt-matmul</td>
<td>Enables or disables a compiler-generated Matrix Multiply (matmul) library call.</td>
</tr>
<tr>
<td>qopt-mem-layout-trans</td>
<td>Controls the level of memory layout transformations performed by the compiler.</td>
</tr>
<tr>
<td>qopt-multi-version-aggressive</td>
<td>Tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement.</td>
</tr>
<tr>
<td>qopt-prefetch, Qopt-prefetch</td>
<td>Enables or disables prefetch insertion optimization.</td>
</tr>
<tr>
<td>qopt-prefetch-distance</td>
<td>Specifies the prefetch distance to be used for compiler-generated prefetches inside loops.</td>
</tr>
<tr>
<td>qopt-prefetch-issue-excl-hint, Qopt-prefetch-issue-excl-hint</td>
<td>Supports the prefetchW instruction in Intel® microarchitecture code name Broadwell and later.</td>
</tr>
<tr>
<td>qopt-ra-region-strategy, Qopt-ra-region-strategy</td>
<td>Selects the method that the register allocator uses to partition each routine into regions.</td>
</tr>
<tr>
<td>qopt-report, Qopt-report</td>
<td>Tells the compiler to generate an optimization report.</td>
</tr>
<tr>
<td>qopt-report-annotate, Qopt-report-annotate</td>
<td>Enables the annotated source listing feature and specifies its format.</td>
</tr>
<tr>
<td>qopt-report-annotate-position, Qopt-report-annotate-position</td>
<td>Enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.</td>
</tr>
<tr>
<td>qopt-report-embed, Qopt-report-embed</td>
<td>Determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated.</td>
</tr>
<tr>
<td>qopt-report-file, Qopt-report-file</td>
<td>Specifies that the output for the optimization report goes to a file, stderr, or stdout.</td>
</tr>
<tr>
<td>qopt-report-filter, Qopt-report-filter</td>
<td>Tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application.</td>
</tr>
<tr>
<td>qopt-report-format, Qopt-report-format</td>
<td>Specifies the format for an optimization report.</td>
</tr>
<tr>
<td>qopt-report-help, Qopt-report-help</td>
<td>Displays the optimizer phases available for report generation and a short description of what is reported at each level.</td>
</tr>
<tr>
<td>qopt-report-names, Qopt-report-names</td>
<td>Specifies whether mangled or unmangled names should appear in the optimization report.</td>
</tr>
<tr>
<td>qopt-report-per-object, Qopt-report-per-object</td>
<td>Tells the compiler that optimization report information should be generated in a separate file for each object.</td>
</tr>
<tr>
<td>qopt-report-phase, Qopt-report-phase</td>
<td>Specifies one or more optimizer phases for which optimization reports are generated.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>qopt-report-routine</td>
<td>Tells the compiler to generate an optimization report for each of the</td>
</tr>
<tr>
<td></td>
<td>routines whose names contain the specified substring.</td>
</tr>
<tr>
<td>qopt-streaming-stores</td>
<td>Enables generation of streaming stores for optimization.</td>
</tr>
<tr>
<td>qopt-subscript-in-range</td>
<td>Determines whether the compiler assumes that there are no &quot;large&quot;</td>
</tr>
<tr>
<td></td>
<td>integers being used or being computed inside loops.</td>
</tr>
<tr>
<td>qopt-threads-per-core</td>
<td>Informs the compiler about the number of hardware threads per core that</td>
</tr>
<tr>
<td></td>
<td>will be used for an application. This option only applies when targeting</td>
</tr>
<tr>
<td></td>
<td>Intel® Xeon Phi™ products.</td>
</tr>
<tr>
<td>qopt-zmm-usage</td>
<td>Defines a level of zmm registers usage.</td>
</tr>
<tr>
<td>qoverride-limits</td>
<td>Lets you override certain internal compiler limits that are intended to</td>
</tr>
<tr>
<td></td>
<td>prevent excessive memory usage or compile times for very large,</td>
</tr>
<tr>
<td></td>
<td>complex compilation units.</td>
</tr>
<tr>
<td>Qpar-adjust-stack</td>
<td>Tells the compiler to generate code to adjust the stack size for a fiber-</td>
</tr>
<tr>
<td></td>
<td>based main thread.</td>
</tr>
<tr>
<td>Qpatchable-addresses</td>
<td>Tells the compiler to generate code such that references to statically</td>
</tr>
<tr>
<td></td>
<td>assigned addresses can be patched.</td>
</tr>
<tr>
<td>Qpci</td>
<td>Enable precompiled header coexistence to reduce build time.</td>
</tr>
<tr>
<td>Qsafeeh</td>
<td>Registers exception handlers for safe exception handling.</td>
</tr>
<tr>
<td>Qsfalign</td>
<td>Specifies stack alignment for functions.</td>
</tr>
<tr>
<td>qsimd-honor-fp-model</td>
<td>Tells the compiler to obey the selected floating-point model when</td>
</tr>
<tr>
<td></td>
<td>vectorizing SIMD loops.</td>
</tr>
<tr>
<td>qsimd-serialize-fp-reduction</td>
<td>Tells the compiler to serialize floating-point reduction when vectorizing</td>
</tr>
<tr>
<td></td>
<td>SIMD loops.</td>
</tr>
<tr>
<td>Quse-msasm-symbols</td>
<td>Tells the compiler to use a dollar sign (&quot;$&quot;) when producing symbol</td>
</tr>
<tr>
<td></td>
<td>names.</td>
</tr>
<tr>
<td>Qvc</td>
<td>Specifies compatibility with Microsoft® Visual C++ or Microsoft® Visual</td>
</tr>
<tr>
<td></td>
<td>Studio.</td>
</tr>
<tr>
<td>Qvla</td>
<td>Determines whether variable length arrays are enabled.</td>
</tr>
<tr>
<td>rcd, Qrcd</td>
<td>Enables fast float-to-integer conversions. This is a deprecated option.</td>
</tr>
<tr>
<td></td>
<td>There is no replacement option.</td>
</tr>
<tr>
<td>regcall, Qregcall</td>
<td>Tells the compiler that the __regcall calling convention should be used</td>
</tr>
<tr>
<td></td>
<td>for functions that do not directly specify a calling convention.</td>
</tr>
<tr>
<td>restrict, Qrestrict</td>
<td>Determines whether pointer disambiguation is enabled with the restrict</td>
</tr>
<tr>
<td></td>
<td>qualifier.</td>
</tr>
<tr>
<td>RTC</td>
<td>Enables checking for certain run-time conditions.</td>
</tr>
<tr>
<td>save-temps, Qsave-temps</td>
<td>Tells the compiler to save intermediate files created during compilation.</td>
</tr>
<tr>
<td>scalar-rep, Qscalar-rep</td>
<td>Enables or disables the scalar replacement optimization done by the</td>
</tr>
<tr>
<td></td>
<td>compiler as part of loop transformations.</td>
</tr>
<tr>
<td>S</td>
<td>Causes the compiler to compile to an assembly file only and not link.</td>
</tr>
<tr>
<td>shared-intel</td>
<td>Causes Intel-provided libraries to be linked in dynamically.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>shared-libgcc</td>
<td>Links the GNU libgcc library dynamically.</td>
</tr>
<tr>
<td>shared</td>
<td>Tells the compiler to produce a dynamic shared object instead of an executable.</td>
</tr>
<tr>
<td>showIncludes</td>
<td>Tells the compiler to display a list of the include files.</td>
</tr>
<tr>
<td>simd, Qsimd</td>
<td>Enables or disables compiler interpretation of simd pragmas.</td>
</tr>
<tr>
<td>simd-function-pointers, Qsimd-function-pointers</td>
<td>Enables or disables pointers to simd-enabled functions.</td>
</tr>
<tr>
<td>sox</td>
<td>Tells the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions.</td>
</tr>
<tr>
<td>static-intel</td>
<td>Causes Intel-provided libraries to be linked in statically.</td>
</tr>
<tr>
<td>static-libgcc</td>
<td>Links the GNU libgcc library statically.</td>
</tr>
<tr>
<td>staticlib</td>
<td>Invokes the libtool command to generate static libraries.</td>
</tr>
<tr>
<td>static-libstdc++</td>
<td>Links the GNU libstdc++ library statically.</td>
</tr>
<tr>
<td>static</td>
<td>Prevents linking with shared libraries.</td>
</tr>
<tr>
<td>std, Qstd</td>
<td>Tells the compiler to conform to a specific language standard.</td>
</tr>
<tr>
<td>stdlib</td>
<td>Lets you select the C++ library to be used for linking.</td>
</tr>
<tr>
<td>strict-ansi</td>
<td>Tells the compiler to implement strict ANSI conformance dialect.</td>
</tr>
<tr>
<td>sysroot</td>
<td>Specifies the root directory where headers and libraries are located.</td>
</tr>
<tr>
<td>tbb, Qtbb</td>
<td>Tells the compiler to link to the Intel® Threading Building Blocks (Intel® TBB) libraries.</td>
</tr>
<tr>
<td>tcollect, Qtcollect</td>
<td>Inserts instrumentation probes calling the Intel® Trace Collector API.</td>
</tr>
<tr>
<td>tcollect-filter, Qtcollect-filter</td>
<td>Lets you enable or disable the instrumentation of specified functions. You must also specify option [Q]tcollect.</td>
</tr>
<tr>
<td>Tc</td>
<td>Tells the compiler to process a file as a C source file.</td>
</tr>
<tr>
<td>TC</td>
<td>Tells the compiler to process all source or unrecognized file types as C source files.</td>
</tr>
<tr>
<td>Tp</td>
<td>Tells the compiler to process a file as a C++ source file.</td>
</tr>
<tr>
<td>traceback</td>
<td>Tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time.</td>
</tr>
<tr>
<td>T</td>
<td>Tells the linker to read link commands from a file.</td>
</tr>
<tr>
<td>u (Linux*)</td>
<td>Tells the compiler the specified symbol is undefined.</td>
</tr>
<tr>
<td>u (Windows*)</td>
<td>Disables all predefined macros and assertions.</td>
</tr>
<tr>
<td>undef</td>
<td>Disables all predefined macros.</td>
</tr>
<tr>
<td>unroll, Qunroll</td>
<td>Tells the compiler the maximum number of times to unroll loops.</td>
</tr>
<tr>
<td>unroll-aggressive, Qunroll-aggressive</td>
<td>Determines whether the compiler uses more aggressive unrolling for certain loops.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>use-asm, Quse-asm</td>
<td>Tells the compiler to produce objects through the assembler. This is a</td>
</tr>
<tr>
<td></td>
<td>deprecated option. There is no replacement option.</td>
</tr>
<tr>
<td>use-intel-optimized-headers, Quse-intel-optimized-headers</td>
<td>Determines whether the performance headers directory is added to the</td>
</tr>
<tr>
<td></td>
<td>include path search list.</td>
</tr>
<tr>
<td>use-msasm</td>
<td>Enables the use of blocks and entire functions of assembly code within a</td>
</tr>
<tr>
<td></td>
<td>C or C++ file.</td>
</tr>
<tr>
<td>U</td>
<td>Undefines any definition currently in effect for the specified macro.</td>
</tr>
<tr>
<td>V (Windows*)</td>
<td>Places the text string specified into the object file being generated by the</td>
</tr>
<tr>
<td></td>
<td>compiler.</td>
</tr>
<tr>
<td>vd</td>
<td>Enables or suppresses hidden vtordisp members in C++ objects.</td>
</tr>
<tr>
<td>V</td>
<td>Displays the compiler version information.</td>
</tr>
<tr>
<td>vec, Qvec</td>
<td>Enables or disables vectorization.</td>
</tr>
<tr>
<td>vecabi, Qvecabi</td>
<td>Determines which vector function application binary interface (ABI) the</td>
</tr>
<tr>
<td></td>
<td>compiler uses to create or call vector functions.</td>
</tr>
<tr>
<td>vec-guard-write, Qvec-guard-write</td>
<td>Tells the compiler to perform a conditional check in a vectorized loop.</td>
</tr>
<tr>
<td>vec-threshold, Qvec-threshold</td>
<td>Sets a threshold for the vectorization of loops.</td>
</tr>
<tr>
<td>version</td>
<td>Tells the compiler to display GCC-style version information.</td>
</tr>
<tr>
<td>vmb</td>
<td>Selects the smallest representation that the compiler uses for pointers to</td>
</tr>
<tr>
<td></td>
<td>members.</td>
</tr>
<tr>
<td>vmg</td>
<td>Selects the general representation that the compiler uses for pointers to</td>
</tr>
<tr>
<td></td>
<td>members.</td>
</tr>
<tr>
<td>vmm</td>
<td>Enables pointers to class members with single or multiple inheritance.</td>
</tr>
<tr>
<td>vms</td>
<td>Enables pointers to members of single-inheritance classes.</td>
</tr>
<tr>
<td>vmv</td>
<td>Enables pointers to members of any inheritance type.</td>
</tr>
<tr>
<td>v</td>
<td>Specifies that driver tool commands should be displayed and executed.</td>
</tr>
<tr>
<td>w, W</td>
<td>Specifies the level of diagnostic messages to be generated by the</td>
</tr>
<tr>
<td></td>
<td>compiler.</td>
</tr>
<tr>
<td>Wabi</td>
<td>Determines whether a warning is issued if generated code is not C++ ABI</td>
</tr>
<tr>
<td></td>
<td>compliant.</td>
</tr>
<tr>
<td>Wall</td>
<td>Enables warning and error diagnostics.</td>
</tr>
<tr>
<td>Wa</td>
<td>Passes options to the assembler for processing.</td>
</tr>
<tr>
<td>watch</td>
<td>Tells the compiler to display certain information to the console output</td>
</tr>
<tr>
<td></td>
<td>window.</td>
</tr>
<tr>
<td>Wbrief</td>
<td>Tells the compiler to display a shorter form of diagnostic output.</td>
</tr>
<tr>
<td>Wcheck</td>
<td>Tells the compiler to perform compile-time code checking for certain code.</td>
</tr>
<tr>
<td>Wcomment</td>
<td>Determines whether a warning is issued when /* appears in the middle of</td>
</tr>
<tr>
<td></td>
<td>a /* */ comment.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>context-limit, Qcontext-limit</td>
<td>Set the maximum number of template instantiation contexts shown in diagnostic.</td>
</tr>
<tr>
<td>wd, Qwd</td>
<td>Disables a soft diagnostic. This is a deprecated option. The replacement option is [Q]diag-disable.</td>
</tr>
<tr>
<td>Wdeprecated</td>
<td>Determines whether warnings are issued for deprecated C++ headers.</td>
</tr>
<tr>
<td>deprecation</td>
<td></td>
</tr>
<tr>
<td>w</td>
<td>Disables all warning messages.</td>
</tr>
<tr>
<td>we, Qwe</td>
<td>Changes a soft diagnostic to an error. This is a deprecated option. The replacement option is [Q]diag-error.</td>
</tr>
<tr>
<td>Weffc++, Qeffc++</td>
<td>Enables warnings based on certain C++ programming guidelines.</td>
</tr>
<tr>
<td>Werror, WX</td>
<td>Changes all warnings to errors.</td>
</tr>
<tr>
<td>Werror-all</td>
<td>Causes all warnings and currently-enabled remarks to be reported as errors.</td>
</tr>
<tr>
<td>Wextra-tokens</td>
<td>Determines whether warnings are issued about extra tokens at the end of preprocessor directives.</td>
</tr>
<tr>
<td>Wformat</td>
<td>Determines whether argument checking is enabled for calls to printf, scanf, and so forth.</td>
</tr>
<tr>
<td>Wformat-security</td>
<td>Determines whether the compiler issues a warning when the use of format functions may cause security problems.</td>
</tr>
<tr>
<td>Wic-pointer</td>
<td>Determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.</td>
</tr>
<tr>
<td>Winline</td>
<td>Warns when a function that is declared as inline is not inlined.</td>
</tr>
<tr>
<td>WI</td>
<td>Passes options to the linker for processing.</td>
</tr>
<tr>
<td>WL</td>
<td>Tells the compiler to display a shorter form of diagnostic output.</td>
</tr>
<tr>
<td>Wmain</td>
<td>Determines whether a warning is issued if the return type of main is not expected.</td>
</tr>
<tr>
<td>Wmissing-declarations</td>
<td>Determines whether warnings are issued for global functions and variables without prior declaration.</td>
</tr>
<tr>
<td>Wmissing-prototypes</td>
<td>Determines whether warnings are issued for missing prototypes.</td>
</tr>
<tr>
<td>wn, Qwn</td>
<td>Controls the number of errors displayed before compilation stops. This is a deprecated option. The replacement option is [Q]diag-error-limit.</td>
</tr>
<tr>
<td>Wnon-virtual-dtor</td>
<td>Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one.</td>
</tr>
<tr>
<td>wo, Qwo</td>
<td>Tells the compiler to issue one or more diagnostic messages only once. This is a deprecated option. The replacement option is [Q]diag-once id.</td>
</tr>
<tr>
<td>Wp64</td>
<td>Tells the compiler to display diagnostics for 64-bit porting.</td>
</tr>
<tr>
<td>Wpch-messages</td>
<td>Determines whether the compiler shows precompiled header (PCH) informational messages.</td>
</tr>
<tr>
<td>Wpointer-arith</td>
<td>Determines whether warnings are issued for questionable pointer arithmetic.</td>
</tr>
<tr>
<td>Wport</td>
<td>Tells the compiler to issue portability diagnostics.</td>
</tr>
<tr>
<td>Wp</td>
<td>Passes options to the preprocessor.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>wr, Qwr</td>
<td>Changes a soft diagnostic to an remark. This is a deprecated option. The replacement option is [Q]diag-remark.</td>
</tr>
<tr>
<td>Wremarks</td>
<td>Tells the compiler to display remarks and comments.</td>
</tr>
<tr>
<td>Wreorder</td>
<td>Tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed.</td>
</tr>
<tr>
<td>Wreturn-type</td>
<td>Determines whether warnings are issued when a function is declared without a return type, when the definition of a function returning void contains a return statement with an expression, or when the closing brace of a function returning non-void is reached.</td>
</tr>
<tr>
<td>Wshadow</td>
<td>Determines whether a warning is issued when a variable declaration hides a previous declaration.</td>
</tr>
<tr>
<td>Wsign-compare</td>
<td>Determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.</td>
</tr>
<tr>
<td>Wstrict-aliasing</td>
<td>Determines whether warnings are issued for code that might violate the optimizer's strict aliasing rules.</td>
</tr>
<tr>
<td>Wstrict-prototypes</td>
<td>Determines whether warnings are issued for functions declared or defined without specified argument types.</td>
</tr>
<tr>
<td>Wtrigraphs</td>
<td>Determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.</td>
</tr>
<tr>
<td>Wuninitialized</td>
<td>Determines whether a warning is issued if a variable is used before being initialized.</td>
</tr>
<tr>
<td>Wunknown-pragmas</td>
<td>Determines whether a warning is issued if an unknown #pragma directive is used.</td>
</tr>
<tr>
<td>Wunused-function</td>
<td>Determines whether a warning is issued if a declared function is not used.</td>
</tr>
<tr>
<td>Wunused-variable</td>
<td>Determines whether a warning is issued if a local or non-constant static variable is unused after being declared.</td>
</tr>
<tr>
<td>ww, Qww</td>
<td>Changes a soft diagnostic to an warning. This is a deprecated option. The replacement option is [Q]diag-warning.</td>
</tr>
<tr>
<td>Wwrite-strings</td>
<td>Issues a diagnostic message if const char * is converted to (non-const) char *.</td>
</tr>
<tr>
<td>x, Qx</td>
<td>Tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate.</td>
</tr>
<tr>
<td>x (type option)</td>
<td>All source files found subsequent to -x type will be recognized as a particular type.</td>
</tr>
<tr>
<td>xHost, QxHost</td>
<td>Tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.</td>
</tr>
<tr>
<td>Xlinker</td>
<td>Passes a linker option directly to the linker.</td>
</tr>
<tr>
<td>X</td>
<td>Removes standard directories from the include file search path.</td>
</tr>
<tr>
<td>Yc</td>
<td>Tells the compiler to create a precompiled header file.</td>
</tr>
<tr>
<td>Yd</td>
<td>Tells the compiler to add complete debugging information in all object files created from a precompiled header file when option /Zi or /Z7 is specified. This is a deprecated option. There is no replacement option.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Y-</td>
<td>Tells the compiler to ignore all other precompiled header files.</td>
</tr>
<tr>
<td>Yu</td>
<td>Tells the compiler to use a precompiled header file.</td>
</tr>
<tr>
<td>Za</td>
<td>Disables Microsoft Visual C++ compiler language extensions.</td>
</tr>
<tr>
<td>Zc</td>
<td>Lets you specify ANSI C standard conformance for certain language features.</td>
</tr>
<tr>
<td>Ze</td>
<td>Enables Microsoft Visual C++ compiler language extensions. This is a deprecated option. There is no replacement option.</td>
</tr>
<tr>
<td>Zg</td>
<td>Tells the compiler to generate function prototypes. This is a deprecated option. There is no replacement option.</td>
</tr>
<tr>
<td>Zl, Z7, ZI</td>
<td>Tells the compiler to generate full debugging information in either an object (.obj) file or a project database (PDB) file.</td>
</tr>
<tr>
<td>Zl</td>
<td>Causes library names to be omitted from the object file.</td>
</tr>
<tr>
<td>Zo</td>
<td>Enables or disables generation of enhanced debugging information for optimized code.</td>
</tr>
<tr>
<td>Zp</td>
<td>Specifies alignment for structures on byte boundaries.</td>
</tr>
<tr>
<td>Zs</td>
<td>Tells the compiler to check only for correct syntax.</td>
</tr>
</tbody>
</table>

## Deprecated and Removed Compiler Options

This topic lists deprecated and removed compiler options and suggests replacement options, if any are available.

For more information on compiler options, see the detailed descriptions of the individual option descriptions in this section.

### Deprecated Options

Occasionally, compiler options are marked as "deprecated." Deprecated options are still supported in the current release, but are planned to be unsupported in future releases.

The following two tables list options that are currently deprecated.

Note that deprecated options are not limited to these lists.

### Deprecated Linux* and macOS* Options

<table>
<thead>
<tr>

**Removed Options**

Some compiler options are no longer supported and have been removed. If you use one of these options, the compiler issues a warning, ignores the option, and then proceeds with compilation.

The following two tables list options that are no longer supported.

Note that removed options are not limited to these lists.

**Removed Linux* and macOS* Options**

### Ways to Display Certain Option Information

This section describes how you can see options that are passed to offload compilation and how you can get general information about compiler options on the command line.

#### Displaying Options Passed to Offload Compilation

This topic only applies when targeting Intel® Xeon Phi™ products.

To display compiler options that are passed to offload compilation after they are specified on the host compilation command line, specify the following option, which is only available when targeting Intel® Xeon Phi™ products:

- `~watch=mic-cmd` ! Linux systems
- `/watch:mic-cmd` ! Windows systems

Only options that are automatically passed are displayed.

For more information about the `watch` option, which can also be used to display other information, see `watch`.

Other compiler options are not passed to offload compilation automatically.

If you want to pass additional options to offload compilation, or you would like to override the command line options automatically passed to offload compilation, you must use option `[q or Q]offload-option` to specify the additional or overriding options.

---

### Optimization Notice

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

**Displaying General Option Information From the Command Line**

To display a list of all available compiler options, specify option help on the command line.

To display functional groupings of compiler options, specify a functional category for option help. For example, to display a list of options that affect diagnostic messages, enter one of the following commands:

<table>
<thead>
<tr>
<th>Category</th>
<th>Linux and macOS* systems</th>
<th>Windows systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>/help diagnostics</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For details on other categories you can specify, see help.

**Compiler Option Details**

This section contains the full details about compiler options, including descriptions of each compiler option.

In this section compiler options are listed within their categories. To see an alphabetical list of compiler options, see [Alphabetical List of Compiler Options](#).

**General Rules for Compiler Options**

This section describes general rules for compiler options and it contains information about how we refer to compiler option names in descriptions.

**General Rules for Compiler Options**

You cannot combine options with a single dash (Linux* and macOS*) or slash (Windows*). For example:

- On Linux* and macOS* systems: This is incorrect: `-wc`; this is correct: `-w -c`
- On Windows* systems: This is incorrect: `/wc`; this is correct: `/w /c`

All compiler options are case sensitive. Some options have different meanings depending on their case; for example, option "c" prevents linking, but option "C" places comments in preprocessed source output.

Options specified on the command line apply to all files named on the command line.

Options can take arguments in the form of file names, strings, letters, or numbers. If a string includes spaces, the string must be enclosed in quotation marks. For example:

- On Linux* and macOS* systems, `-dynamic-linker mylink (file name)` or `-Umacro3 (string)`
- On Windows* systems, `/Famyfile.s (file name)` or `/V"version 5.0" (string)`

Compiler options can appear in any order.

On Windows* systems, all compiler options must precede `/link` options, if any, on the command line.

Unless you specify certain options, the command line will both compile and link the files you specify.

You can abbreviate some option names, entering as many characters as are needed to uniquely identify the option.

Certain options accept one or more keyword arguments following the option name. For example, the `ax` option accepts several keywords.

To specify multiple keywords, you typically specify the option multiple times.

Compiler options remain in effect for the whole compilation unless overridden by a compiler `#pragma`.

To disable an option, specify the negative form of the option.

On Windows* systems, you can also disable one or more optimization options by specifying option `/Od` last on the command line.
NOTE
On Windows* systems, the /Od option is part of a mutually-exclusive group of options that includes /Od, /O1, /O2, /O3, and /Ox. The last of any of these options specified on the command line will override the previous options from this group.

If there are enabling and disabling versions of an option on the command line, the last one on the command line takes precedence.

How We Refer to Compiler Option Names in Descriptions
The following conventions are used as shortcuts when referencing compiler option names in descriptions:

- Many options have names that are the same on Linux*, macOS*, and Windows*, except that the Windows form starts with an initial / and the Linux and macOS* form starts with an initial - . Within text, such option names are shown without the initial character; for example, check.
- Many options have names that are the same on Linux*, macOS*, and Windows*, except that the Windows form starts with an initial Q. Within text, such option names are shown as [Q]option-name.
  
  For example, if you see a reference to [Q]ip, the Linux* and macOS* form of the option is -ip and the Windows form of the option is /Qip.
- Several compiler options have similar names except that the Linux* and macOS* forms start with an initial q and the Windows form starts with an initial Q. Within text, such option names are shown as [q or Q]option-name.
  
  For example, if you see a reference to [q or Q]opt-report, the Linux* and macOS* form of the option is -qopt-report and the Windows form of the option is /Qopt-report.

Compiler option names that are more dissimilar are shown in full.

What Appears in the Compiler Option Descriptions
This section contains details about what appears in the option descriptions.

Following sections include individual descriptions of all the current compiler options. The option descriptions are arranged by functional category. Within each category, the option names are listed in alphabetical order.

Each option description contains the following information:

- The primary name for the option and a short description of the option.
- Architecture Restrictions
  This section only appears if there is a known architecture restriction for the option.

  Restrictions may appear for any of the following architectures:
  
  - IA-32 architecture
  - Intel® 64 architecture
  - Intel® 64 architecture targeting Intel® Many Integrated Core Architecture (Intel® MIC Architecture)
    Intel® Xeon Phi™ processors are processors that are based on the Intel® Many Integrated Core Architecture (Intel® MIC Architecture)
    
    Note that within the relevant compiler option descriptions, this restriction will be referred to as ... when targeting Intel® Xeon Phi™ products.
  - Intel® 64 architecture targeting the Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing)

  Certain operating systems are not available on all the above architectures. For the latest information, please check your Release Notes.
- Syntax
  This shows the syntax on Linux* and macOS* systems and the syntax on Windows* systems. If the option has no syntax on one of these systems, that is, the option is not valid on a particular operating system, it will specify "None".
• Arguments
  This shows any arguments (parameters) that are related to the option. If the option has no arguments, it will specify "None".

• Default
  This shows the default setting for the option.

• Description
  This shows the full description of the option. It may also include further information on any applicable arguments.

• IDE Equivalent
  This shows information related to the integrated development environment (IDE) Property Pages on Windows*, Linux*, and macOS* systems. It shows on which Property Page the option appears, and under what category it's listed. The Windows* IDE is Microsoft* Visual Studio* .NET; the Linux* IDE is Eclipse*; the macOS* IDE is Xcode*. If the option has no IDE equivalent, it will specify "None".

• Alternate Options
  This lists any options that are synonyms for the described option. If there are no alternate option names, it will show "None".
  Some of the alternate option names are deprecated and may be removed in future releases.
  Many options have an older spelling where underscores ("_") instead of hyphens ("-") connect the main option names. The older spelling is a valid alternate option name.

Some option descriptions may also have the following:

• Example
  This shows a short example that includes the option

• See Also
  This shows where you can get further information on the option or related options.

### Offload Options

**qoffload, Qoffload**

*Lets you specify the mode for offloading or tell the compiler to ignore language constructs for offloading. This option only applies when targeting Intel® Xeon Phi™ products. This is a deprecated option. There is no replacement option.*

### Architecture Restrictions

*Keywords mandatory and optional: Only available when targeting Intel® Xeon Phi™ products
/Qoffload- and /Qoffload:none: Only available when targeting Intel® Xeon Phi™ products*

### Syntax

**Linux OS:**

- `-qoffload[=keyword]`
- `-qno-offload`

**macOS:**

None

**Windows OS:**

- `/Qoffload[=:keyword]`
- `/Qoffload-`
- `/Qoffload:none`
Arguments

**keyword**

Specifies the mode for offloading or it disables offloading. Possible values are:

- **none**
  
  Tells the compiler to ignore language constructs for offloading. Warnings are issued by the compiler. This is equivalent to the negative form of the option.

- **mandatory**
  
  Specifies that offloading is mandatory (required). If the target is not available, one of the following occurs:
  
  - If no status clause is specified for the offload pragma, the program fails with an error message.
  - If the status clause is specified, the program continues execution on the CPU.

- **optional**
  
  Specifies that offloading is optional (requested). If the target is not available, the program is executed on the CPU, not the target.

Default

**mandatory**

The compiler recognizes language constructs for offloading if they are specified. If option `--offload (Linux*)` or `/Qoffload (Windows*)` is specified with no keyword, the default is **mandatory**.

Description

This option lets you specify the mode for offloading or tell the compiler to ignore language constructs for offloading.

Option `--offload` is the replacement option for `-offload`, which is deprecated.

If no `--offload (Linux*)` or `/Qoffload (Windows*)` option appears on the command line, then offload pragmas are processed and:

- The mandatory or optional clauses are obeyed if present
- If no mandatory or optional clause is present, the offload is mandatory

If any of the following appears on the command line, then offload pragmas are ignored:

- **Linux* systems**: `--offload=none` or `--no-offload`
- **Windows* systems**: `/offload:none` or `/Qoffload-

However, OpenMP* pragmas for processor control (for example, omp target) are recognized if the `[q or Q]openmp` option is specified, regardless of whether or not offload pragmas are recognized or ignored.

If **keyword** **mandatory** or **optional** appears for `[Q]offload`, then offload pragmas are processed and:

- The mandatory or optional clauses are obeyed, regardless of the `--offload (Linux*)` or `/Qoffload (Windows*)` **keyword**
- If no mandatory or optional clause is present, then the `--offload (Linux*)` or `/Qoffload (Windows*)` **keyword** is obeyed

If the status clause is specified for an offload pragma, it affects run-time behavior.
IDE Equivalent
Visual Studio: **Code Generation [Intel C++] > Offload Constructs**
Eclipse: **Language > Offload Constructs**
Xcode: None

Alternate Options
None

offload pragma

Supported Environment Variables

qoffload-arch, Qoffload-arch
Lets you specify the target architecture to use when offloading code. This option only applies when targeting Intel® Xeon Phi™ products.

Architecture Restrictions
Only available when targeting Intel® Xeon Phi™ products

Syntax

Linux OS:
-qoffload-arch=arch

macOS:
None

Windows OS:
/Qoffload-arch:arch

Arguments

**arch**

Specifies the target architecture.

On Intel® 64 architecture targeting Intel® MIC Architecture, **arch** can be:

- mic-avx512, targeting the Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing)

Default

mic-avx512

On Intel® 64 architecture targeting Intel® MIC Architecture, the default **arch** is mic-avx512.

Description
This option lets you specify the target architecture to use when offloading code.

The following table shows the vISA version that each **arch** supports:
The following are various combinations and settings of command line options for offloading:

- **Offload**: Intel® 64 architecture host and Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing) target code generation:

  ```
  icc ... -qoffload-arch=mic-avx512     ! Linux
  icl ... /Qoffload-arch=mic-avx512     ! Windows
  ```

- **Offload**: Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing) host and target code generation (for this host, target defaults to Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing)):

  ```
  icc ... -xmic-avx512      ! Linux
  icl ... /Qxmic-avx512     ! Windows
  ```

- **Native**: Code Generation for Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing):

  ```
  icc ... -xmic-avx512 -qno-offload     ! Linux
  icl ... /Qxmic-avx512 /Qno-offload    ! Windows
  ```

**IDE Equivalent**

Visual Studio: **Code Generation [Intel C++] > Offload Target Architecture**

Eclipse: **Code Generation > Offload Target Architecture**

Xcode: None

**Alternate Options**

None

**See Also**

qoffload, Qoffload compiler option

x, Qx compiler option, setting MIC-AVX512

**qoffload-attribute-target, Qoffload-attribute-target**

Causes the compiler to flag file-scope functions and data objects in the source file with the offload attribute target(mic). This option only applies when targeting Intel® Xeon Phi™ products. This is a deprecated option. There is no replacement option.

**Architecture Restrictions**

Only available when targeting Intel® Xeon Phi™ products

**Syntax**

**Linux OS:**

-qoffload-attribute-target=target-name

**macOS:**

None
Windows OS:
/Qoffload-attribute-target:target-name

**Arguments**

*target-name*  
Is a specific target or application. The following value is supported: *mic*.

**Default**

OFF  
The compiler does not flag file-scope functions and data objects in the source file with the offload attribute `target(mic)`.

**Description**

This option causes the compiler to flag file-scope functions and data objects in the source file with the offload attribute `target(mic)`.

This option is similar to using the pragma `offload_attribute target(mic)` to set the attribute `target(mic)` for all functions and data objects in the file scope.

Target declspecs/attributes on individual declarations take precedence over any `offload_attribute` pragma in effect, and declspecs, attributes, and pragmas all take precedence over this option.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

Consider the following individual source files:

If you compile them as follows, it will properly place an instance of `subr` in the host (CPU) and target binaries:

**See Also**

`offload_attribute`
`target_attribute`
Placing Variables and Functions on the Processor

**qoffload-option, Qoffload-option**

*Let you explicitly specify options to be used for the specified target and tool. This option only applies when targeting Intel® Xeon Phi™ products.*

**Architecture Restrictions**

Only available when targeting Intel® Xeon Phi™ products

**Syntax**

Linux OS:

```
-qoffload-option,target,tool,"option-list"
```

macOS:

None
Windows OS:
/Qoffload-option, target, tool,"option-list"

Arguments

**target**
Is a specific target or application. The following value is supported: mic.

**tool**
Is the tool that the option-list is associated with. It can be one of the following values: ld, link, as, or compiler.

ld is the linker tool on Linux*; link is the linker tool on Windows*.

**option-list**
Is one or more options that are specific to the tool. The quotation mark delimiters are required. Each option in the option-list must be separated by a space.

For tool compiler, use compiler-specific options; for tool ld, use linker-specific options; for tool as, use assembler-specific options. The options for the tools always use the Linux form even when compiling on Windows.

Default
OFF
The compiler does not pass additional options to the separate tools on the target architecture.

Description
This option lets you explicitly specify options to be used for the specified target and tool. It can be specified multiple times on the command line.

When building a heterogeneous application, the driver passes all compiler options specified on the command-line to the host compilation and only certain options to the offload compilation. To see a list of options passed to the offload compilation, specify option watch=mic-cmd.

If you want to pass additional options to the offload compilation, or you would like to override the command line options passed to offload compilation, you must use option [q or Q]offload-option to specify the additional or overriding options.

**NOTE**
If you specify the options I, L, D, or U with the option [q or Q]offload-option, they override any other I, L, D, and U options that are automatically passed from host to offload compilation.

To achieve the overriding effect, the I, L, D, and U options specified using [q or Q]offload-option are placed ahead of the I, L, D, and U options automatically copied over from the host compilation. All other options specified using [q or Q]offload-option are placed after the options copied over from host to offload compilation.

IDE Equivalent
Visual Studio: **Code Generation > Additional Options for MIC Offload Compiler**
Eclipse: **Compiler > Command Line > Additional Options for MIC Offload Compiler**
Xcode: None
Alternate Options
None

Example

The following shows a valid example for the compiler tool:

```bash
-qoffload-option,mic,compiler, "-O3 -diag-disable 1234 -vec-report2" ! Linux*
/Qoffload-option,mic,compiler, "-O3 -diag-disable 1234 -vec-report2" ! Windows*
```

The following shows another example for the compiler tool:

```bash
-qoffload-option,mic,compiler, "-O3 -vec-report3" ! Linux*
/Qoffload-option,mic,compiler, "-O3 -vec-report3" ! Windows*
```

The following shows a valid example for the Linux* ld tool:

```bash
-qoffload-option,mic,ld,"-lmylib -L/my/path"
```

The following shows a valid example for the Windows* link tool:

```bash
/Qoffload-option,mic,link,"--no-undefined <install-dir>/mkl/lib/mic/libmkl_intel_lp64.a"
```

Note that when you specify a path containing spaces in the option-list, you must enclose the path in quotes with escape characters (\") so it is interpreted correctly by the compiler.

The following shows a valid example for the Linux* as tool:

```bash
-qoffload-option,mic,as,"<assembler options>" ! Linux*
/Qoffload-option,mic,as,"<assembler options>" ! Windows*
```

The following Linux* example causes the offload compilation to search -I/my_dir/mic/include first, and to use -DMY_DEFINE=20 because they override the previously mentioned -I/my_dir/include and -DMY_DEFINE=10. The compiler also passes -L/my_dir/mic/lib -L/my_dir/lib to the offload ld step:

```bash
icc -qoffload-option,mic,compiler, "-I/my_dir/include -L/my_dir/lib -DMY_DEFINE=10 -I/my_dir/mic/include -DMY_DEFINE=20" -offload-option,mic,ld, "-L/my_dir/mic/lib" hello.c
```

The following Linux* example demonstrates how options specified in -qoffload-option override options automatically passed from host compilation to offload compilation:

```bash
-qoffload-option,mic,compiler,"-O3 -DMY_DEFINE=MIC" -DMY_DEFINE=HOST -O2
```

-DMY_DEFINE=HOST -O2 will be used for the host compilation. However, -DMY_DEFINE=MIC -O3 will override -O2 and -DMY_DEFINE=HOST for the offload compilation.

watch compiler option
qoffload, Qoffload compiler option

Optimization Options

falias, Oa
Determines whether aliasing is assumed in a program.

Syntax

Linux OS and macOS:

- falias
- fno-alias
**Windows OS:**
/Oa
/Oa-

**Arguments**
None

**Default**

-falias or /Oa-

On Linux* and macOS*, aliasing is assumed in the program. On Windows*, aliasing is not assumed in a program.

**Description**
This option determines whether aliasing is assumed in a program.
If you specify -fno-alias or /Oa, aliasing is not assumed in a program.
If you specify -falias or /Oa-, aliasing is assumed in a program. However, this may affect performance.

**IDE Equivalent**
Visual Studio: None
Eclipse: **Data > Assume No Aliasing in Program**
Xcode: **Data > Assume No Aliasing in Program**

**Alternate Options**
None

**See Also**
ffnalias compiler option

**fast**
*Maximizes speed across the entire program.*

**Syntax**

**Linux OS and macOS:**
-fast

**Windows OS:**
/fast

**Arguments**
None

**Default**
OFF

The optimizations that maximize speed are not enabled.

**Description**
This option maximizes speed across the entire program.
It sets the following options:

On macOS* systems: -ipo, -mdynamic-no-pic, -O3, -no-prec-div, -fp-model fast=2, and -xHost
On Windows* systems: /O3, /Qipo, /Qprec-div-, /fp:fast=2, and /QxHost
On Linux* systems: -ipo, -O3, -no-prec-div, -static, -fp-model fast=2, and -xHost

When option fast is specified, you can override the [Q]xHost option setting by specifying a different processor-specific [Q]x option on the command line. However, the last option specified on the command line takes precedence.

For example:
- On Linux* systems, if you specify option -fast -xSSE3, option -xSSE3 takes effect. However, if you specify -xSSE3 -fast, option -xHost takes effect.
- On Windows* systems, if you specify option /fast /QxSSE3, option /QxSSE3 takes effect. However, if you specify /QxSSE3 /fast, option /QxHost takes effect.

For implications on non-Intel processors, refer to the [Q]xHost documentation.

**NOTE**
Option fast sets some aggressive optimizations that may not be appropriate for all applications. The resulting executable may not run on processor types different from the one on which you compile. You should make sure that you understand the individual optimization options that are enabled by option fast.

compiler option
x, Qx
compiler option

**fbuiltin, Oi**

Enables or disables inline expansion of intrinsic functions.
Syntax

Linux OS and macOS:
- `fbuiltin[-name]`
- `fno-builtin[-name]`

Windows OS:
/`Oi[-]`
/`Qno-builtin-name`

Arguments

`name` Is a list of one or more intrinsic functions. If there is more than one intrinsic function, they must be separated by commas.

Default
ON Inline expansion of intrinsic functions is enabled.

Description
This option enables or disables inline expansion of one or more intrinsic functions.
If `-fno-builtin-name` or `/Qno-builtin-name` is specified, inline expansion is disabled for the named functions. If `name` is not specified, `-fno-builtin` or `/Oi-` disables inline expansion for all intrinsic functions.

For a list of built-in functions affected by `-fbuiltin`, search for "built-in functions" in the appropriate gcc* documentation.

For a list of built-in functions affected by `/Oi`, search for "/Oi" in the appropriate Microsoft* Visual C/C++* documentation.

IDE Equivalent
Visual Studio: **Optimization > Enable Intrinsic Functions (/Oi)**
Eclipse: None
Xcode: None

Alternate Options
None

`fdefer-pop`
Determines whether the compiler always pops the arguments to each function call as soon as that function returns.

Syntax

Linux OS and macOS:
- `fdefer-pop`
- `fno-defer-pop`

Windows OS:
None
Arguments
None

Default
-fdefer-pop

Description
The compiler uses default optimizations that may result in deferred clearance of the stack arguments.

This option determines whether the compiler always pops the arguments to each function call as soon as that function returns.

If you want the compiler to always pop the arguments to each function call as soon as that function returns, specify -fno-defer-pop.

For processors that must pop arguments after a function call, the compiler normally lets arguments accumulate on the stack for several function calls and pops them all at once.

IDE Equivalent
None

Alternate Options
None

ffnalias, Ow
Determines whether aliasing is assumed within functions.

Syntax
Linux OS and macOS:
-ffnalias
-fno-fnnalias

Windows OS:
/Ow
/Ow-

Arguments
None

Default
-ffnalias

Description
This option determines whether aliasing is assumed within functions.

If you specify -fno-fnnalias or /Ow-, aliasing is not assumed within functions, but it is assumed across calls.

If you specify -ffnalias or /Ow, aliasing is assumed within functions.
IDE Equivalent
None

Alternate Options
None

See Also
falias compiler option

ffunction-sections
Places each function in its own COMDAT section.

Syntax
Linux OS and macOS:
-ffunction-sections

Windows OS:
None

Arguments
None

Default
OFF

Description
Places each function in its own COMDAT section.

IDE Equivalent
None

Alternate Options
-fdata-sections

foptimize-sibling-calls
Determines whether the compiler optimizes tail recursive calls.

Syntax
Linux OS and macOS:
-foptimize-sibling-calls
-foptimize-sibling-calls

Windows OS:
None

Arguments
None
**Default**

-foptimize-sibling-calls  The compiler optimizes tail recursive calls.

**Description**

This option determines whether the compiler optimizes tail recursive calls. It enables conversion of tail recursion into loops.

If you do not want to optimize tail recursive calls, specify -fno-optimize-sibling-calls.

Tail recursion is a special form of recursion that doesn't use stack space. In tail recursion, a recursive call is converted to a GOTO statement that returns to the beginning of the function. In this case, the return value of the recursive call is only used to be returned. It is not used in another expression. The recursive function is converted into a loop, which prevents modification of the stack space used.

**IDE Equivalent**

None

**Alternate Options**

None

**fprotect-parens, Qprotect-parens**

*Determines whether the optimizer honors parentheses when floating-point expressions are evaluated.*

**Syntax**

**Linux OS and macOS:**

-fprotect-parens
-fno-protect-parens

**Windows OS:**

/Qprotect-parens
/Qprotect-parens-

**Arguments**

None

**Default**

-fno-protect-parens  or /Qprotect-parens-  Parentheses are ignored when determining the order of expression evaluation.

**Description**

This option determines whether the optimizer honors parentheses when determining the order of floating-point expression evaluation.

When option -fprotect-parens (Linux* and macOS*) or /Qprotect-parens (Windows*) is specified, the optimizer will maintain the order of evaluation imposed by parentheses in the code.

When option -fno-protect-parens (Linux* and macOS*) or /Qprotect-parens- (Windows*) is specified, the optimizer may reorder floating-point expressions without regard for parentheses if it produces faster executing code.
IDE Equivalent
None

Alternate Options
None

Example
Consider the following expression:

\[ A + (B + C) \]

By default, the parentheses are ignored and the compiler is free to re-order the floating-point operations based on the optimization level, the setting of option `-fp-model` (Linux* and macOS*) or `/fp` (Windows*), etc. to produce faster code. Code that is sensitive to the order of operations may produce different results (such as with some floating-point computations).

However, if `-fprotect-parens` (Linux* and macOS*) or `/Qprotect-parens` (Windows*) is specified, parentheses around floating-point expressions (including complex floating-point and decimal floating-point) are honored and the expression will be interpreted following the normal precedence rules, that is, \( B + C \) will be computed first and then added to \( A \).

This may produce slower code than when parentheses are ignored. If floating-point sensitivity is a specific concern, you should use option `-fp-model precise` (Linux* and macOS*) or `/fp:precise` (Windows*) to ensure precision because it controls all optimizations that may affect precision.

See Also
`fp-model`, `fp` compiler option

Gf

Enables read/write string-pooling optimization. This is a deprecated option. The replacement option is `/GF`.

Syntax

Linux OS and macOS:

None

Windows OS:

/Gf

Arguments

None

Default

ON

Read/write string-pooling optimization is enabled.

Description

This option enables read/write string-pooling optimization.

You should not use `/Gf` if you write to your strings because it can result in unexpected behavior. If you are not writing to your strings, you should use `/GF`.

IDE Equivalent

None
Alternate Options
Linux and macOS*: None
Windows: /GF

See Also
GF compiler option

GF
Enables read-only string-pooling optimization.

Syntax
Linux OS and macOS:
None
Windows OS:
/GF

Arguments
None

Default
OFF
Read/write string-pooling optimization is enabled.

Description
This option enables read only string-pooling optimization.

IDE Equivalent
Visual Studio: Code Generation > Enable String Pooling
Eclipse: None
Xcode: None

Alternate Options
None

nolib-inline
Disables inline expansion of standard library or intrinsic functions.

Syntax
Linux OS and macOS:
-nolib-inline
Windows OS:
None

Arguments
None
Default
OFF

The compiler inlines many standard library and intrinsic functions.

Description
This option disables inline expansion of standard library or intrinsic functions. It prevents the unexpected results that can arise from inline expansion of these functions.

IDE Equivalent
Visual Studio: None
Eclipse: **Optimization > Disable Intrinsic Inline Expansion**
Xcode: **Optimization > Disable Intrinsic Inline Expansion**

Alternate Options
None

O
*Specifies the code optimization for applications.*

Syntax

**Linux OS and macOS:**

```bash
-O [n]
```

**Windows OS:**

```
/O [n]
```

Arguments

n  
Is the optimization level. Possible values are 1, 2, or 3. On Linux* and macOS* systems, you can also specify 0.

Default

O2  
Optimizes for code speed. This default may change depending on which other compiler options are specified. For details, see below.

Description
This option specifies the code optimization for applications.

<table>
<thead>
<tr>

</tbody>
</table>
### Option Description

- Enables global optimization; this includes data-flow analysis, code motion, strength reduction and test replacement, split-lifetime analysis, and instruction scheduling.
- Disables inlining of some intrinsics.

This option may set other options. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release.

The **O1** option may improve performance for applications with very large code size, many branches, and execution time not dominated by code within loops.

**O2**

Enables optimizations for speed. This is the generally recommended optimization level.

Vectorization is enabled at **O2** and higher levels.

On systems using IA-32 architecture: Some basic loop optimizations such as Distribution, Predicate Opt, Interchange, multi-versioning, and scalar replacements are performed.

This option also enables:

- Inlining of intrinsics
- Intra-file interprocedural optimization, which includes:
  - inlining
  - constant propagation
  - forward substitution
  - routine attribute propagation
  - variable address-taken analysis
  - dead static function elimination
  - removal of unreferenced variables
- The following capabilities for performance gain:
  - constant propagation
  - copy propagation
  - dead-code elimination
  - global register allocation
  - global instruction scheduling and control speculation
  - loop unrolling
  - optimized code selection
  - partial redundancy elimination
  - strength reduction/induction variable simplification
  - variable renaming
  - exception handling optimizations
  - tail recursions
  - peephole optimizations
  - structure assignment lowering and optimizations
  - dead store elimination

This option may set other options, especially options that optimize for code speed. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release.
On Linux systems, the -debug inline-debug-info option will be enabled by default if you compile with optimizations (option -O2 or higher) and debugging is enabled (option -g).

Many routines in the shared libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

Performs O2 optimizations and enables more aggressive loop transformations such as Fusion, Block-Unroll-and-Jam, and collapsing IF statements.

This option may set other options. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release.

When O3 is used with options -ax or -x (Linux) or with options /Qax or /Qx (Windows), the compiler performs more aggressive data dependency analysis than for O2, which may result in longer compilation times.

The O3 optimizations may not cause higher performance unless loop and memory access transformations take place. The optimizations may slow down code in some cases compared to O2 optimizations.

The O3 option is recommended for applications that have loops that heavily use floating-point calculations and process large data sets.

Many routines in the shared libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

The last O option specified on the command line takes precedence over any others.

**IDE Equivalent**

Visual Studio: **Optimization > Optimization**

Eclipse: **General > Optimization Level**

Xcode: **General > Optimization Level**

**Alternate Options**

O0

Linux and macOS*: None

Windows: /Od

See Also

Od compiler option

Od

Disables all optimizations.

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Od
**Arguments**
None

**Default**
OFF
The compiler performs default optimizations.

**Description**
This option disables all optimizations. It can be used for selective optimizations, such as a combination of /Od and /Ob1 (disables all optimizations, but enables inlining).
On IA-32 architecture, this option sets the /Oy- option.

**IDE Equivalent**
Visual Studio: **Optimization > Optimization**
Eclipse: None
Xcode: None

**Alternate Options**
Linux and macOS*: -O0
Windows: None

**See Also**
- compiler option (see O0)

**Ofast**
Sets certain aggressive options to improve the speed of your application.

**Syntax**

**Linux OS and macOS:**
-Ofast

**Windows OS:**
None

**Arguments**
None

**Default**
OFF
The aggressive optimizations that improve speed are not enabled.

**Description**
This option improves the speed of your application.
It sets compiler options -O3, -no-prec-div, and -fp-model fast=2.
On Linux* systems, this option is provided for compatibility with gcc.

**IDE Equivalent**
None
Alternate Options
None

See Also
0 compiler option
prec-div, Qprec-div compiler option

fp-model, fp compiler option

Os
Enables optimizations that do not increase code size; it produces smaller code size than O2.

Syntax
Linux OS and macOS:
-0s

Windows OS:
/0s

Arguments
None

Default
OFF

Optimizations are made for code speed. However, if O1 is specified, Os is the default.

Description
This option enables optimizations that do not increase code size; it produces smaller code size than O2. It disables some optimizations that increase code size for a small speed benefit.

This option tells the compiler to favor transformations that reduce code size over transformations that produce maximum performance.

IDE Equivalent
Visual Studio: Optimization > Favor Size or Speed
Eclipse: None
Xcode: None

Alternate Options
None

See Also
0 compiler option
Ot compiler option

Ot
Enables all speed optimizations.
Syntax

Linux OS and macOS:
None

Windows OS:
/Ot

Arguments
None

Default
/Ot

Description

Optimizations are made for code speed.
If Od is specified, all optimizations are disabled. If O1 is specified, Os is the default.

IDE Equivalent

Code Generation Options

arch
*Tells the compiler which features it may target, including which instruction sets it may generate.*

Syntax

Linux OS and macOS:
None

Windows OS:
/\arch:code

Arguments

code

Indicates to the compiler a feature set that it may target, including which instruction sets it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (SSSE). Possible values are:

- AMBERLAKE
- BROADWELL
- CANNONLAKE
- CASCADELAKE
- COFFEELAKE
- GOLDMONT
- GOLDMONT-PLUS
- HASWELL
- ICELAKE-CLIENT (or ICELAKE)
- ICELAKE-SERVER
- IVYBRIDGE
- KABYLake
- KNL

May generate instructions for processors that support the specified Intel® processor or microarchitecture code name.

Keyword ICELAKE is deprecated and may be removed in a future release.
KNM
SANDYBRIDGE
SILVERMONT
SKYLAKE
SKYLAKE-AVX512
TREMONT
WHISKEYLAKE

CORE-AVX2
May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

CORE-AVX-I
May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

AVX
May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

SSE4.2
May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

SSE4.1
May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

SSSE3
May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.

SSE3
May generate Intel® SSE3, SSE2, and SSE instructions.

SSE2
May generate Intel® SSE2 and SSE instructions.

SSE
This option has been deprecated; it is now the same as specifying IA32.

IA32
Generates x86/x87 generic code that is compatible with IA-32 architecture. Disables any default extended instruction settings, and any previously set extended instruction settings. It also disables all feature-specific optimizations and instructions. This value is only available on IA-32 architecture.

Default
SSE2
The compiler may generate Intel® SSE2 and SSE instructions.

Description
This option tells the compiler which features it may target, including which instruction sets it may generate. Code generated with these options should execute on any compatible, non-Intel processor with support for the corresponding instruction set.

Options /arch and /Qx are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.
If you specify both the /Qax and /arch options, the compiler will not generate Intel-specific instructions.

**IDE Equivalent**

Visual Studio: Code Generation > Enable Enhanced Instruction Set

Eclipse: None

Xcode: None

**Alternate Options**

Linux and macOS*: -m

Windows: None

WHISKEYLAKE

**COMMON-AVX512**
May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection instructions, as well as the instructions enabled with CORE-AVX2.

**MIC-AVX512**

This keyword is only available on Windows* and Linux*.

**CORE-AVX512**
May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection instructions, Intel® AVX-512 Doubleword and Quadword instructions, Intel® AVX-512 Byte and Word instructions and Intel® AVX-512 Vector Length extensions, as well as the instructions enabled with CORE-AVX2.

**CORE-AVX2**
May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.

**CORE-AVX-I**
May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.

**AVX**
May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.

**SSE4.2**
May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel processors.

**SSE4.1**
May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.
SSSE3
May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions for Intel® processors. For macOS* systems, this value is only supported on Intel® 64 architecture. This replaces value T, which is deprecated.

SSE3
May generate Intel® SSE3, SSE2, and SSE instructions for Intel® processors. This value is not available on macOS* systems.

SSE2
May generate Intel® SSE2 and SSE instructions for Intel® processors. This value is not available on macOS* systems.

Default
OFF
No auto-dispatch code is generated. Feature-specific code is generated and is controlled by the setting of the following compiler options:

- Linux*: -m and -x
- Windows*: /arch and /Qx
- macOS*: -x

Description
This option tells the compiler to generate multiple, feature-specific auto-dispatch code paths for Intel® processors if there is a performance benefit. It also generates a baseline code path. The Intel feature-specific auto-dispatch path is usually more optimized than the baseline path. Other options, such as O3, control how much optimization is performed on the baseline path.

The baseline code path is determined by the architecture specified by options -m or -x (Linux* and macOS*) or options /arch or /Qx (Windows*). While there are defaults for the [Q]x option that depend on the operating system being used, you can specify an architecture and optimization level for the baseline code that is higher or lower than the default. The specified architecture becomes the effective minimum architecture for the baseline code path.

If you specify both the [Q]ax and [Q]x options, the baseline code will only execute on Intel® processors compatible with the setting specified for the [Q]x.

If you specify both the -ax and -m options (Linux and macOS*) or the /Qax and /arch options (Windows), the baseline code will execute on non-Intel processors compatible with the setting specified for the -m or /arch option.

If you specify both the -ax and -march options (Linux and macOS*), or the /Qax and /arch options (Windows), the compiler will not generate Intel-specific instructions.

The [Q]ax option tells the compiler to find opportunities to generate separate versions of functions that take advantage of features of the specified instruction features.

If the compiler finds such an opportunity, it first checks whether generating a feature-specific version of a function is likely to result in a performance gain. If this is the case, the compiler generates both a feature-specific version of a function and a baseline version of the function. At run time, one of the versions is chosen to execute, depending on the Intel® processor in use. In this way, the program can benefit from performance gains on more advanced Intel processors, while still working properly on older processors and non-Intel processors. A non-Intel processor always executes the baseline code path.
You can use more than one of the feature values by combining them. For example, you can specify `-axSSE4.1,SSSE3` (Linux and macOS) or `/QaxSSE4.1,SSSE3` (Windows). You cannot combine the old style, deprecated options and the new options. For example, you cannot specify `-axSSE4.1,T` (Linux and macOS) or `/QaxSSE4.1,T` (Windows).

**Optimization Notice**

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

**IDE Equivalent**

m compiler option

**EH**

*Specifies the model of exception handling to be performed.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/EH$type

/EH$type-  

**Arguments**

*type*  

Specifies the exception handling model. Possible values are:

*a*  

Specifies the asynchronous C++ exception handling model.
Specifies the synchronous C++ exception handling model.

tells the compiler to assume that extern "C" functions do not throw exceptions.

tells the compiler to always generate runtime termination checks for all noexcept functions. It forces runtime termination checks in all functions that have a noexcept attribute.

If you specify c, you must also specify a or s.

Default

OFF

Some exception handling is performed by default.

Description

This option specifies the model of exception handling to be performed.

If you specify the negative form of the option, it disables the exception handling performed by type or the last type if there are two. For example, if you specify /EHsc-, it is interpreted as /EHs.

For more details about option /EH, see the Microsoft documentation.

IDE Equivalent

Visual Studio: Code Generation > Enable C++ Exceptions

Eclipse: None

Xcode: None

Alternate Options

/EHsc

Linux and macOS*: None

Windows: /GX

Qsafeeh compiler option

fasyncynchronous-unwind-tables

Determines whether unwind information is precise at an instruction boundary or at a call boundary.

Syntax

Linux OS and macOS:

-fasyncynchronous-unwind-tables

-fno-asynchronous-unwind-tables

Windows OS:

None

Arguments

None
Default

Intel® 64 architecture: -fasynchronous-unwind-tables
IA-32 architecture (Linux* only):
-fno-asynchronous-unwind-tables

The unwind table generated is precise at an instruction boundary, enabling accurate unwinding at any instruction.

The unwind table generated is precise at call boundaries only.

Description

This option determines whether unwind information is precise at an instruction boundary or at a call boundary. The compiler generates an unwind table in DWARF2 or DWARF3 format, depending on which format is supported on your system.

If -fno-asynchronous-unwind-tables is specified, the unwind table is precise at call boundaries only. In this case, the compiler will avoid creating unwind tables for routines such as the following:

• A C++ routine that does not declare objects with destructors and does not contain calls to routines that might throw an exception.
• A C/C++ or Fortran routine compiled without -fexceptions, and on Intel® 64 architecture, without -traceback.
• A C/C++ or Fortran routine compiled with -fexceptions that does not contain calls to routines that might throw an exception.

IDE Equivalent

None

Alternate Options

None

See Also

fexceptions compiler option

fexceptions

Enables exception handling table generation.

Syntax

Linux OS and macOS:
-fexceptions
-fno-exceptions

Windows OS:

None

Arguments

None

Default

-fexceptions
-fno-exceptions

Exception handling table generation is enabled. Default for C++.
Exception handling table generation is disabled. Default for C.
Description
This option enables exception handling table generation. The -fno-exceptions option disables exception handling table generation, resulting in smaller code. When this option is used, any use of exception handling constructs (such as try blocks and throw statements) will produce an error. Exception specifications are parsed but ignored. It also undefines the preprocessor symbol __EXCEPTIONS.

IDE Equivalent
None

Alternate Options
None

fomit-frame-pointer, /Oy
Determines whether EBP is used as a general-purpose register in optimizations.

Architecture Restrictions
Option /Oy[-] is only available on IA-32 architecture

Syntax
Linux OS and macOS:
-fomit-frame-pointer
-fno-omit-frame-pointer

Windows OS:
/Oy
/Oy-

Arguments
None

Default
-fomit-frame-pointer or /Oy

EBP is used as a general-purpose register in optimizations. However, on Linux* and macOS* systems, the default is -fno-omit-frame-pointer if option -O0 or -g is specified. On Windows* systems, the default is /Oy- if option /Od is specified.

Description
These options determine whether EBP is used as a general-purpose register in optimizations. Options -fomit-frame-pointer and /Oy allow this use. Options -fno-omit-frame-pointer and /Oy- disallow it.

Some debuggers expect EBP to be used as a stack frame pointer, and cannot produce a stack backtrace unless this is so. The -fno-omit-frame-pointer and /Oy- options direct the compiler to generate code that maintains and uses EBP as a stack frame pointer for all functions so that a debugger can still produce a stack backtrace without doing the following:

• For -fno-omit-frame-pointer: turning off optimizations with -O0
• For /Oy-: turning off /O1, /O2, or /O3 optimizations
The `-fno-omit-frame-pointer` option is set when you specify option `-00` or the `-g` option. The `-fomit-frame-pointer` option is set when you specify option `-01`, `-02`, or `-03.

The `/Oy` option is set when you specify the `/O1`, `/O2`, or `/O3` option. Option `/Oy-` is set when you specify the `/Od` option.

Using the `-fno-omit-frame-pointer` or `/Oy-` option reduces the number of available general-purpose registers by 1, and can result in slightly less efficient code.

---

**NOTE**
For Linux* systems:

There is currently an issue with GCC 3.2 exception handling. Therefore, the Intel compiler ignores this option when GCC 3.2 is installed for C++ and exception handling is turned on (the default).

---

**IDE Equivalent**

Visual Studio: *Optimization > Omit Frame Pointers*

Eclipse: *Optimization > Provide Frame Pointer*

Xcode: *Optimization > Provide Frame Pointer*

C C++ Calling Conventions

GR
Enables or disables C++ Run Time Type Information (RTTI).
Syntax

Linux OS and macOS:
None

Windows OS:
/GR
/GR-

Arguments

None

Default

/GR

C++ Run Time Type Information (RTTI) is enabled.

Description

This option enables or disables C++ Run Time Type Information (RTTI).
To disable C++ Run Time Type Information (RTTI), specify option /GR-.

IDE Equivalent

Visual Studio: **Language > Enable Run-Time Type Information**
Eclipse: None
Xcode: None

Alternate Options

None

guard

*Enables the control flow protection mechanism.*

Syntax

Linux OS and macOS:
None

Windows OS:
/guard:keyword

Arguments

keyword

Specifies the control flow protection mechanism. Possible values are:

*cf*[-]

Tells the compiler to analyze control flow of valid targets for indirect calls and to insert code to verify the targets at runtime.
To explicitly disable this option, specify /guard:cf-.
The control flow protection mechanism is disabled.

This option enables the control flow protection mechanism. It tells the compiler to analyze control flow of valid targets for indirect calls and inserts a call to a checking routine before each indirect call to verify the target of the given indirect call.

The /guard:cf option must be passed to both the compiler and linker.

Code compiled using /guard:cf can be linked to libraries and object files that are not compiled using the option.

This option has been added for Microsoft compatibility. It uses the Microsoft implementation.

IDE Equivalent

Visual Studio: Code Generation > Control Flow Guard
Eclipse: None
Xcode: None

Alternate Options

None

Gv

Tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.

Syntax

Linux OS and macOS:

None

Windows OS:

/Gv

Arguments

None

Default

OFF

The default calling convention is __cdecl.

This option tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.

It causes each function in the module to compile as __vectorcall unless the function is declared with a conflicting attribute, or the name of the function is main.

This option has been added for Microsoft compatibility.

For more details about the __vectorcall calling convention, see the Microsoft documentation.

hotpatch
Tells the compiler to prepare a routine for hotpatching.
Syntax

Linux OS:
-hotpatch[=n]

macOS:
None

Windows OS:
/hotpatch[:n]

Arguments

\( n \)

An integer specifying the number of bytes the compiler should add before the function entry point.

Default

OFF

The compiler does not prepare routines for hotpatching.

Description

This option tells the compiler to prepare a routine for hotpatching. The compiler inserts nop padding around function entry points so that the resulting image is hot patchable.

Specifically, the compiler adds nop bytes after each function entry point and enough nop bytes before the function entry point to fit a direct jump instruction on the target architecture.

If \( n \) is specified, it overrides the default number of bytes that the compiler adds before the function entry point.

IDE Equivalent

None

Alternate Options

None

\( m \)

Tells the compiler which features it may target, including which instruction sets it may generate.

Syntax

Linux OS and macOS:

-m\texttt{code}

Windows OS:
None

Arguments

\( \texttt{code} \)

Indicates to the compiler a feature set that it may target, including which instruction sets it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (SSSE). Possible values are:
avx
May generate Intel® Advanced Vector Extensions (Intel® AVX), SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

sse4.2
May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

sse4.1
May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

ssse3
May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.

sse3
May generate Intel® SSE3, SSE2, and SSE instructions.

sse2
May generate Intel® SSE2 and SSE instructions. This value is only available on Linux systems.

sse
This option has been deprecated; it is now the same as specifying ia32.

ia32
Generates x86/x87 generic code that is compatible with IA-32 architecture. Disables any default extended instruction settings, and any previously set extended instruction settings. It also disables all feature-specific optimizations and instructions. This value is only available on Linux* systems using IA-32 architecture.

This compiler option also supports many of the –m option settings available with gcc. For more information on gcc –m settings, see the gcc documentation.

Default

Linux* systems: –msse2
macOS* systems: –mssse3

For more information on the default values, see Arguments above.

Description

This option tells the compiler which features it may target, including which instruction sets it may generate. Code generated with these options should execute on any compatible, non-Intel processor with support for the corresponding instruction set.

Options –x and –m are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.

Linux* systems: For compatibility with gcc, the compiler allows the following options but they have no effect. You will get a warning error, but the instructions associated with the name will not be generated. You should use the suggested replacement options.

gcc Compatibility Option (Linux*) Suggested Replacement Option
-mfma –march=core-avx2
-mbmi, -mavx2, -mlzcnt –march=core-avx2
-mmovbe  
-mcrc32, -maes, -mpclmul, -mpopcnt  
-mvzeroupper  
-mfsgsbase, -mrdrnd, -mf16c

IDE Equivalent

The `-m64` option is the same as macOS* option `-arch x86_64`. This option is not related to the Intel® C++ Compiler option `arch`.

On Linux* systems, these options are provided for compatibility with gcc.

**IDE Equivalent**
None

**Alternate Options**
None

**m80387**
Specifies whether the compiler can use x87 instructions.

**Syntax**

**Linux OS and macOS:**
- `-m80387`
- `-mno-80387`

**Windows OS:**
None

**Arguments**
None

**Default**
- `-m80387`
The compiler may use x87 instructions.

**Description**
This option specifies whether the compiler can use x87 instructions.

If you specify option `-mno-80387`, it prevents the compiler from using x87 instructions. If the compiler is forced to generate x87 instructions, it issues an error message.

**IDE Equivalent**
None

**Alternate Options**
- `-m[no-]x87`

**march**
Tells the compiler to generate code for processors that support certain features.
**Syntax**

**Linux OS and macOS:**

`-march=processor`

**Windows OS:**

None

**Arguments**

`processor`

Indicates to the compiler the code it may generate. Possible values are:

- `amberlake`
- `broadwell`
- `cannonlake`
- `cascadelake`
- `coffeelake`
- `goldmont`
- `goldmont-plus`
- `haswell`
- `icelake-client` (or `icelake`)
- `icelake-server`
- `ivybridge`
- `kabylake`
- `knl`
- `knm`
- `sandybridge`
- `silvermont`
- `skylake`
- `skylake-avx512`
- `tremont`
- `whiskeylake`

May generate instructions for processors that support the specified Intel® processor or microarchitecture code name.

**Keywords** `knl` and `silvermont` are only available on Linux* systems.

Keyword `icelake` is deprecated and may be removed in a future release.

- `core-avx2`
  Generates code for processors that support Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

- `core-avx-i`
  Generates code for processors that support Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

- `corei7-avx`
  Generates code for processors that support Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

- `corei7`
  Generates code for processors that support Intel® SSE4 Efficient Accelerated String and Text Processing instructions. May also generate code for
atom
Generates code for processors that support MOVBE instructions, depending on the setting of option -minstruction (Linux* and macOS*) or /Qinstruction (Windows*). May also generate code for SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.

core2
Generates code for the Intel® Core™2 processor family.

pentium4m
Generates code for Intel® Pentium® 4 processors with MMX technology.

pentium-m
Generates code for Intel® Pentium® processors. Value pentium3 is only available on Linux* systems.

Default
pentium4
If no architecture option is specified, value pentium4 is used by the compiler to generate code.

Description
This option tells the compiler to generate code for processors that support certain features.
If you specify both the -ax and -march options, the compiler will not generate Intel-specific instructions.
Specifying -march=pentium4 sets -mtune=pentium4.
For compatibility, a number of historical processor values are also supported, but the generated code will not differ from the default.

Optimization Notice
Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.
Notice revision #20110804

IDE Equivalent
None

Alternate Options
-march=pentium3
Linux: -xSSE
**masm**

Tells the compiler to generate the assembler output file using a selected dialect.

**Syntax**

**Linux OS:**

- `masm= dialect`

**macOS:**

None

**Windows OS:**

None

**Arguments**

`dialect`

Is the dialect to use for the assembler output file. Possible values are:

- `att`
  
  Tells the compiler to generate the assembler output file using AT&T* syntax.

- `intel`
  
  Tells the compiler to generate the assembler output file using Intel syntax.

**Default**

- `masm=att`

  The compiler generates the assembler output file using AT&T* syntax.

**Description**

This option tells the compiler to generate the assembler output file using a selected dialect.
**IDE Equivalent**
None

**Alternate Options**
None

**mconditional-branch, Qconditional-branch**
*Lets you identify and fix code that may be vulnerable to speculative execution side-channel attacks, which can leak your secure data as a result of bad speculation of a conditional branch direction.*

**Syntax**

**Linux OS and macOS:**

-mconditional-branch=keyword

**Windows OS:**

/Qconditional-branch:keyword

**Arguments**

*keyword*

Indicates to the compiler what action to take. Possible values are:

- **keep**
  Tells the compiler to not attempt any vulnerable code detection or fixing. This is equivalent to not specifying the `mconditional-branch` option.

- **pattern-report**
  Tells the compiler to perform a search of vulnerable code patterns in the compilation and report all occurrences to stderr.

- **pattern-fix**
  Tells the compiler to perform a search of vulnerable code patterns in the compilation and generate code to ensure that the identified data accesses are not executed speculatively. It will also report any fixed patterns to stderr.

  This setting does not guarantee total mitigation, it only fixes cases where all components of the vulnerability can be seen or determined by the compiler. The pattern detection will be more complete if advanced optimization options are specified or are in effect, such as option `O3` and option `-ipo` (or `/Qipo`).

- **all-fix**
  Tells the compiler to fix all of the vulnerable code so that it is either not executed speculatively, or there is no observable side-channel created from their speculative execution. Since it is a complete mitigation against Spectre variant 1 attacks, this setting will have the most run-time performance cost.
In contrast to the pattern-fix setting, the compiler will not attempt to identify the exact conditional branches that may have led to the mis-speculated execution.

**Default**

```
-mconditional-branch=keep
/Qconditional-branch:keep
```

The compiler does not attempt any vulnerable code detection or fixing.

**Description**

This option lets you identify code that may be vulnerable to speculative execution side-channel attacks, which can leak your secure data as a result of bad speculation of a conditional branch direction. Depending on the setting you choose, vulnerabilities may be detected and code may be generated to attempt to mitigate the security risk.

**IDE Equivalent**

Visual Studio: **Code Generation [Intel C++] > Spectre Variant 1 Mitigation**

Eclipse: None

Xcode: None

**Alternate Options**

None

**minstruction, Qinstruction**

Determines whether MOVBE instructions are generated for certain Intel processors.

**Syntax**

**Linux OS and macOS:**

```
-minstruction=[no]movbe
```

**Windows OS:**

```
/Qinstruction:[no]movbe
```

**Arguments**

None

**Default**

```
-minstruction=nomovbe
/Qinstruction:nomovbe
```

The compiler does not generate MOVBE instructions for Intel Atom® processors.

**Description**

This option determines whether MOVBE instructions are generated for Intel Atom® processors. To use this option, you must also specify [Q]xATOM_SSSE3 or [Q]xATOM_SSE4.2.

If `-minstruction=movbe` or `/Qinstruction:movbe` is specified, the following occurs:

- MOVBE instructions are generated that are specific to the Intel Atom® processor.
• Generated executables can only be run on Intel Atom® processors or processors that support Supplemental Streaming SIMD Extensions 3 (Intel® SSSE3) or Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) and MOVBE.

If -minstruction=nomovbe or /Qinstruction:nomovbe is specified, the following occurs:
• The compiler optimizes code for the Intel Atom® processor, but it does not generate MOVBE instructions.
• Generated executables can be run on non-Intel Atom® processors that support Intel® SSE3 or Intel® SSE4.2.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
- x, Qx compiler option

**momit-leaf-frame-pointer**
*Determine whether the frame pointer is omitted or kept in leaf functions.*

**Syntax**

**Linux OS and macOS:**
-momit-leaf-frame-pointer
-mno-omit-leaf-frame-pointer

**Windows OS:**
None

**Arguments**
None

**Default**
Varies

*If you specify option -fomit-frame-pointer (or it is set by default), the default is -momit-leaf-frame-pointer. If you specify option -fno-omit-frame-pointer, the default is -mno-omit-leaf-frame-pointer.*

**Description**
This option determines whether the frame pointer is omitted or kept in leaf functions. It is related to option -f[no-]omit-frame-pointer and the setting for that option has an effect on this option.

Consider the following option combinations:

<table>
<thead>
<tr>
<th>Option Combination</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fomit-frame-pointer -momit-leaf-frame-pointer</td>
<td>Both combinations are the same as specifying -fomit-frame-pointer. Frame pointers are omitted for all routines.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option Combination</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fomit-frame-pointer -mno-omit-leaf-frame-pointer</td>
<td>In this case, the frame pointer is omitted for leaf routines, but other routines will keep the frame pointer.</td>
</tr>
<tr>
<td>-fno-omit-frame-pointer -momit-leaf-frame-pointer</td>
<td>This is the intended effect of option -momit-leaf-frame-pointer.</td>
</tr>
<tr>
<td>-fno-omit-frame-pointer -mno-omit-leaf-frame-pointer</td>
<td>In this case, -mno-omit-leaf-frame-pointer is ignored since -fno-omit-frame-pointer retains frame pointers in all routines.</td>
</tr>
<tr>
<td></td>
<td>This combination is the same as specifying -fno-omit-frame-pointer.</td>
</tr>
</tbody>
</table>

This option is provided for compatibility with gcc.

**IDE Equivalent**

Visual Studio: None

Eclipse: **Optimization > Omit frame pointer for leaf routines**

Xcode: **Optimization > Provide Frame Pointer For Leaf Routines**

**Alternate Options**

None

fomit-frame-pointer, Oy compiler option

**mregparm**

* Lets you control the number registers used to pass integer arguments.

**Architecture Restrictions**

Only available on IA-32 architecture

**Syntax**

Linux OS:

- mregparm=n

macOS:

None

Windows OS:

None
Arguments

\( n \)

Specifies the number of registers to use when passing integer arguments. You can specify at most 3 registers. If you specify a nonzero value for \( n \), you must build all modules, including startup modules, and all libraries, including system libraries, with the same value.

Default

OFF

The compiler does not use registers to pass arguments.

Description

Control the number registers used to pass integer arguments. This option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

See Also

mregparm-version compiler option

mregparm-version

Determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention.

Syntax

Linux OS:

- mregparm-version=\( n \)

macOS:

None

Windows OS:

None

Arguments

\( n \)

Specifies the ABI implementation to use. Possible values are:

0  
Tells the compiler to use the most recent ABI implementation.

1  
Tells the compiler to use the ABI implementation that is compatible with gcc 3.4.6 and icc 15.0.

Default

0

The compiler uses the most recent ABI implementation.
**Description**
This option determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention. This option allows compatibility with previous versions of gcc and icc.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
mregparm compiler option

mstringop-inline-threshold, Qstringop-inline-threshold
*Tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified value.*

**Syntax**

**Linux OS and macOS:**
-mstringop-inline-threshold=val

**Windows OS:**
/Qstringop-inline-threshold:val

**Arguments**

val  
Is a positive 32-bit integer. If the size is greater than val, the compiler will never inline it.

**Default**
OFF  
The compiler uses its own heuristics to determine the default.

**Description**
This option tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified val.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
mstringop-strategy, Qstringop-strategy compiler option
**mstringop-strategy, Qstringop-strategy**

* Lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.

**Syntax**

**Linux OS and macOS:**

```
-mstringop-strategy=alg
```

**Windows OS:**

```
/Qstringop-strategy:alg
```

**Arguments**

* `alg` Specifies the algorithm to use. Possible values are:

  - `const_size_loop` Tells the compiler to expand the string operations into an inline loop when the size is known at compile time. If the size is unknown, the compiler uses its own heuristics to decide how to implement the string operation.
  
  - `libcall` Tells the compiler to always use a library call when implementing string operations.
  
  - `rep` Tells the compiler to use its own heuristics to decide what form of `rep movs` | `stos` to use when inlining string operations.

**Default**

`varies`

If optimization option `Os` is specified, the default is `rep`. Otherwise, the default is `const_size_loop`.

**Description**

This option lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

- `mstringop-inline-threshold, Qstringop-inline-threshold` compiler option
- `Os` compiler option
- `mtune, tune`

* Performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike -march).
Syntax

Linux OS and macOS:
-
mtune=processor

Windows OS:
/tune:processor

Arguments

processor

Is the processor for which the compiler should perform optimizations. Possible values are:

- generic
  Optimizes code for the compiler’s default behavior.

- amberlake
  Optimizes code for processors that support the specified Intel® processor or microarchitecture code name.

- broadwell

- cannonlake

- cascadelake

- coffeelake

- goldmont

- goldmont-plus

- haswell

- icelake-client (or icelake)
  Optimizes code for processors that support Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

- icelake-server

- ivybridge

- kabylake

- knl

- knm

- sandybridge

- silvermont

- skylake

- skylake-avx512

- tremont

- whiskeylake

- core-avx2

- core-avx-i
  Optimizes code for processors that support Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

- corei7-avx
  Optimizes code for processors that support Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

Keywords knl and silvermont are only available on Windows* and Linux* systems.

Keyword icelake is deprecated and may be removed in a future release.
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Default**

generic

Code is generated for the compiler's default behavior.

**Description**

This option performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike -march).

The resulting executable is backwards compatible and generated code is optimized for specific processors. For example, code generated with -mtune=core2 or /tune:core2 will run correctly on 4th Generation Intel® Core™ processors, but it might not run as fast as if it had been generated using -mtune=haswell or /tune:haswell. Code generated with -mtune=haswell (/tune:haswell) or -mtune=core-avx2 (/tune:core-avx2) will also run correctly on Intel® Core™2 processors, but it might not run as fast as if it had been generated using -mtune=core2 or /tune:core2. This is in contrast to code generated with -march=core-avx2 or /arch:core-avx2, which will not run correctly on older processors such as Intel® Core™2 processors.

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain
Optimization Notice

Optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

`march` compiler option

`qcf-protection, Qcf-protection`

Enables Control-flow Enforcement Technology (CET) protection, which defends your program from certain attacks that exploit vulnerabilities. This option offers preliminary support for CET.

Syntax

Linux OS:

- `-qcf-protection[=keyword]`

macOS:

None

Windows OS:

`/Qcf-protection[::keyword]`

Arguments

`keyword`

Specifies the level of protection the compiler should perform. Possible values are:

- `shadow_stack`
  
  Enables shadow stack protection.

- `branch_tracking`
  
  Enables endbranch (EB) generation.

- `full`
  
  Enables both shadow stack protection and endbranch (EB) generation.

  This is the same as specifying the `[q or Q]cf-protection option with no keyword.`
none

Disables Control-flow Enforcement Technology (CET) protection.

**Default**

-qcf-protection=none or /Qcf-protection:none

No Control-flow Enforcement protection is performed.

**Description**

This option enables Control-flow Enforcement Technology (CET) protection, which defends your program from certain attacks that exploit vulnerabilities.

CET protections are enforced on processors that support CET. They are ignored on processors that do not support CET, so they are safe to use in programs that might run on a variety of processors.

Specifying `shadow_stack` helps to protect your program from return-oriented programming (ROP). Return-oriented programming (ROP) is a technique to exploit computer security defenses such as non-executable memory and code signing by gaining control of the call stack to modify program control flow and then execute certain machine instruction sequences.

Specifying `branch_tracking` helps to protect your program from call/jump-oriented programming (COP/JOP). Jump-oriented programming (JOP) is a variant of ROP that uses indirect jumps and calls to emulate return instructions. Call-oriented programming (COP) is a variant of ROP that employs indirect calls.

To get both protections, specify `[q or Q]cf-protection` with no keyword, or specify `-qcf-protection=full` (Linux*) or `/Qcf-protection:full` (Windows*).

**NOTE**

On Linux and macOS* systems, you can also specify gcc option `-fcf-protection` to enable CET features. For more information about that option, see the gcc documentation.

**IDE Equivalent**

None

**Alternate Options**

Linux and macOS*: `-fcf-protection` (supported gcc option)

Windows: None

**See Also**

guard compiler option

**Qcxx-features**

Enables standard C++ features without disabling Microsoft features.

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Qcxx-features
Arguments
None

Default
OFF

The compiler enables standard C++ features.

Description
This option enables standard C++ features without disabling Microsoft features within the bounds of what is provided in the Microsoft headers and libraries.

This option has the same effect as specifying /EHsc /GR.

IDE Equivalent
None

Alternate Options
None

Qpatchable-addresses
This option tells the compiler to generate code such that references to statically assigned addresses can be patched.

Architecture Restrictions
Only available on Intel® 64 architecture

Syntax
Linux OS and macOS:
None

Windows OS:
/Qpatchable-addresses

Arguments
None

Default
OFF

The compiler does not generate patchable addresses.

Description
This option tells the compiler to generate code such that references to statically assigned addresses can be patched with arbitrary 64-bit addresses.

Normally, the Windows* system compiler that runs on Intel® 64 architecture uses 32-bit relative addressing to reference statically allocated code and data. That assumes the code or data is within 2GB of the access point, an assumption that is enforced by the Windows object format.

However, in some patching systems, it is useful to have the ability to replace a global address with some other arbitrary 64-bit address, one that might not be within 2GB of the access point.
This option causes the compiler to avoid 32-bit relative addressing in favor of 64-bit direct addressing so that the addresses can be patched in place without additional code modifications. This option causes code size to increase, and since 32-bit relative addressing is usually more efficient than 64-bit direct addressing, you may see a performance impact.

**IDE Equivalent**

None

**Alternate Options**

None

**Qsafeeh**

*Registers exception handlers for safe exception handling.*

**Architecture Restrictions**

Only available on IA-32 architecture

**Syntax**

*Linux OS and macOS:*

None

*Windows OS:*

/Qsafeeh[-]

**Arguments**

None

**Default**

ON

Exception handlers are enabled for safe exception handling.

**Description**

Registers exception handlers for safe exception handling. It also marks objects as "compatible with the Registered Exception Handling feature" whether they contain handlers or not. This is important because the Windows linker will only generate the "special registered EH table" if ALL objects that it is building into an image are marked as compatible. If any objects are not marked as compatible, the EH table is not generated.

Digital signatures certify security and are required for components that are shipped with Windows, such as device drivers.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

/HE compiler option
regcall, Qregcall
Tells the compiler that the __regcall calling convention should be used for functions that do not directly specify a calling convention.

Syntax

Linux OS and macOS:
- regcall

Windows OS:
/Qregcall

Arguments

None

Default

OFF The __regcall calling convention will only be used if a function explicitly specifies it.

Description

This option tells the compiler that the __regcall calling convention should be used for functions that do not directly specify a calling convention. This calling convention ensures that as many values as possible are passed or returned in registers.

It ensures that __regcall is the default calling convention for functions in the compilation, unless another calling convention is specified in a declaration.

This calling convention is ignored if it is specified for a function with variable arguments.

Note that all __regcall functions must have prototypes.

IDE Equivalent

None

Alternate Options

None

C/C++ Calling Conventions

x, Qx
Tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate.

Syntax

Linux OS and macOS:
- xcode

Windows OS:
/Qxcode
Arguments

code

Indicates to the compiler a feature set that it may target, including which instruction sets and optimizations it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (Intel® SSSE). Possible values are:

- AMBERLAKE
- BROADWELL
- CANNONLAKE
- CASCADELAKE
- COFFEELAKE
- GOLDMONT
- GOLDMONT-PLUS
- HASWELL
- ICELAKE-CLIENT (or ICELAKE)
- ICELAKE-SERVER
- IVYBRIDGE
- KABYLAKE
- KNL
- KNM
- SANDYBRIDGE
- SILVERMONT
- SKYLAKE
- SKYLAKE-AVX512
- TREMONT
- WHISKEYLAKE
- COMMON-AVX512

May generate instructions for processors that support the specified Intel® processor or microarchitecture code name. Optimizes for the specified Intel® processor or microarchitecture code name.

Keywords KNL and SILVERMONT are only available on Windows® and Linux® systems.

Keyword ICELAKE is deprecated and may be removed in a future release.

- MIC-AVX512

May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection instructions, as well as the instructions enabled with CORE-AVX2. Optimizes for Intel® processors that support Intel® AVX-512 instructions.

This keyword is only available on Windows® and Linux® systems.

- CORE-AVX512

May generate Intel® Advanced Vector Extensions 512 Doubleword and Quadword instructions, Intel® AVX-512 Byte and Word instructions and
Intel® AVX-512 Vector Length extensions, as well as the instructions enabled with CORE-AVX2. Optimizes for Intel® processors that support Intel® AVX-512 instructions.

**CORE-AVX2**

May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel® processors that support Intel® AVX2 instructions.

**CORE-AVX-I**

May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel® processors that support Float-16 conversion instructions and the RDRND instruction.

**AVX**

May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel processors that support Intel® AVX instructions.

**SSE4.2**

May generate Intel® SSE4 Efficient Accelerated String and Text Processing instructions, Intel® SSE4 Vectorizing Compiler and Media Accelerator, and Intel® SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE4.2 instructions.

**SSE4.1**

May generate Intel® SSE4 Vectorizing Compiler and Media Accelerator instructions for Intel® processors. May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel processors that support Intel® SSE4.1 instructions.

**ATOM_SSE4.2**

May generate MOVBE instructions for Intel® processors, depending on the setting of option -minstruction (Linux* and macOS*) or /Qinstruction (Windows*). May also generate Intel® SSE4.2, SSE3, SSE2, and SSE instructions for Intel processors. Optimizes for Intel Atom® processors that support Intel® SSE4.2 and MOVBE instructions.

This keyword is only available on Windows* and Linux* systems.

**ATOM_SSSE3**

May generate MOVBE instructions for Intel® processors, depending on the setting of option -minstruction (Linux* and macOS*) or /Qinstruction (Windows*). May also generate SSSE3, Intel® SSE3, SSE2, and SSE instructions for
Intel processors. Optimizes for Intel Atom® processors that support Intel® SSE3 and MOVBE instructions.

This keyword is only available on Windows* and Linux* systems.

SSSE3
May generate SSSE3 and Intel® SSE3, SSE2, and SSE instructions for Intel® processors. Optimizes for Intel processors that support SSSE3 instructions. For macOS* systems, this value is only supported on Intel® 64 architecture. This replaces value T, which is deprecated.

SSE3
May generate Intel® SSE3, SSE2, and SSE instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE3 instructions. This value is not available on macOS* systems.

SSE2
May generate Intel® SSE2 and SSE instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE2 instructions. This value is not available on macOS* systems.

You can also specify Host. For more information, see option [Q]xHost.

Default
Windows* systems: None
Linux* systems: None
macOS* systems: SSSE3

On Windows systems, if neither /Qx nor /arch is specified, the default is /arch:SSE2.
On Linux systems, if neither –x nor –m is specified, the default is –msse2.

Description
This option tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate. It also enables optimizations in addition to Intel feature-specific optimizations.

The specialized code generated by this option may only run on a subset of Intel® processors.

The resulting executables created from these option code values can only be run on Intel® processors that support the indicated instruction set.

The binaries produced by these code values will run on Intel® processors that support the specified features.

Do not use code values to create binaries that will execute on a processor that is not compatible with the targeted processor. The resulting program may fail with an illegal instruction exception or display other unexpected behavior.

Compiling the function main() with any of the code values produces binaries that display a fatal run-time error if they are executed on unsupported processors, including all non-Intel processors.

Compiler options m and arch produce binaries that should run on processors not made by Intel that implement the same capabilities as the corresponding Intel® processors.

The –x and /Qx options enable additional optimizations not enabled with options –m or /arch (nor with options –ax and /Qax).
On Windows systems, options `/Qx` and `/arch` are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning. Similarly, on Linux and macOS* systems, options `-x` and `-m` are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.

**NOTE**
All settings except SSE2 do a CPU check. However, if you specify option `-O0` (Linux* or macOS*) or option `/Od` (Windows*), no CPU check is performed.

**xHost, QxHost**
*Tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.*

**Syntax**

**Linux OS and macOS:**
- `-xHost`

**Windows OS:**
- `/QxHost`
### Arguments
None

### Default
- **Windows* systems:** None
- **Linux* systems:** None
- **macOS* systems:** -xSSSE3

On Windows systems, if neither /Qx nor /arch is specified, the default is /arch:SSE2.

On Linux systems, if neither -x nor -m is specified, the default is -msse2.

### Description
This option tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.

The instructions generated by this compiler option differ depending on the compilation host processor.

The following table describes the effects of specifying the [Q]xHost option and it tells whether the resulting executable will run on processors different from the host processor.

Descriptions in the table refer to Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® Advanced Vector Extensions (Intel® AVX), Intel® Streaming SIMD Extensions (Intel® SSE), and Supplemental Streaming SIMD Extensions (SSSE).

### Interprocedural Optimization (IPO) Options

#### fflat-lto-objects

_Determines whether a fat link-time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (`-c -ipo`)._

#### Syntax

Linux OS:

- `-fflat-lto-objects`
- `-fno-fat-lto-objects`
**macOS:**
None

**Windows OS:**
None

### Arguments
None

### Default

`-ffat-lto-objects`  
When `-c -ipo` is specified, the compiler generates a fat link-time optimization (LTO) object that has both a true object and a discardable intermediate language section.

### Description
This option determines whether a fat link time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (`-c -ipo`).

During an interprocedural optimization compilation (`-c -ipo`), the following occurs:

- If you specify `-ffat-lto-objects`, the compiler generates a fat link-time optimization (LTO) object that has both a true object and a discardable intermediate language section. This enables both link-time optimization (LTO) linking and normal linking.
- If you specify `-fno-fat-lto-objects`, the compiler generates a fat link-time optimization (LTO) object that only has a discardable intermediate language section; no true object is generated. This option may improve compilation time.

Note that these files will be inserted into archives in the form in which they were created.

This option is provided for compatibility with gcc. For more information about this option, see the gcc documentation.

---

**NOTE**
Intel's intermediate language representation is not compatible with gcc's intermediate language representation.

---

### IDE Equivalent
None

### Alternate Options
None

### See Also
- `ipo`, `Qipo` compiler option

### ip, Qip
*Determines whether additional interprocedural optimizations for single-file compilation are enabled.*
Syntax

Linux OS and macOS:
- ip
  -no-ip

Windows OS:
/Qip
/Qip-

Arguments
None

Default
OFF

Some limited interprocedural optimizations occur, including inline function expansion for calls to functions defined within the current source file. These optimizations are a subset of full intra-file interprocedural optimizations. Note that this setting is not the same as -no-ip (Linux* and macOS*) or /Qip- (Windows*).

Description
This option determines whether additional interprocedural optimizations for single-file compilation are enabled.

The [Q]ip option enables additional interprocedural optimizations for single-file compilation.

Options -no-ip (Linux and macOS*) and /Qip- (Windows) may not disable inlining. To ensure that inlining of user-defined functions is disabled, specify -inline-level=0 or -fno-inline (Linux and macOS*), or specify /Ob0 (Windows). To ensure that inlining of compiler intrinsic functions is disabled, specify -fno-builtin (Linux and macOS*) or /Oi- (Windows).

IDE Equivalent
Visual Studio: Optimization > Interprocedural Optimization
Eclipse: Optimization > Enable Interprocedural Optimizations for Single File Compilation
Xcode: Optimization > Enable Interprocedural Optimization for Single File Compilation

Alternate Options
None

See Also
finline-functions compiler option

ip-no-inlining, Qip-no-inlining
Disables full and partial inlining enabled by interprocedural optimization options.

Syntax

Linux OS and macOS:
-ip-no-inlining
Windows OS:
/Qip-no-inlining

.Arguments
None

.Default
OFF Inlining enabled by interprocedural optimization options is performed.

.Description
This option disables full and partial inlining enabled by the following interprocedural optimization options:
- On Linux* and macOS* systems: -ip or -ipo
- On Windows* systems: /Qip, /Qipo, or /Ob2

It has no effect on other interprocedural optimizations.

On Windows systems, this option also has no effect on user-directed inlining specified by option /Ob1.

.IDE Equivalent
None

.Alternate Options
None

.ip-no-pinlining, Qip-no-pinlining
Disables partial inlining enabled by interprocedural optimization options.

.Syntax
Linux OS and macOS:
-ip-no-pinlining

Windows OS:
/Qip-no-pinlining

.Arguments
None

.Default
OFF Inlining enabled by interprocedural optimization options is performed.

.Description
This option disables partial inlining enabled by the following interprocedural optimization options:
- On Linux* and macOS* systems: -ip or -ipo
- On Windows* systems: /Qip or /Qipo

It has no effect on other interprocedural optimizations.
IDE Equivalent
None

Alternate Options
None

ipo, Qipo
Enables interprocedural optimization between files.

Syntax

Linux OS and macOS:
-ipo\[n\]
-no-ipo

Windows OS:
/Qipo\[n\]
/Qipo-

Arguments

\(n\)
Is an optional integer that specifies the number of object files the compiler should create. The integer must be greater than or equal to 0.

Default

-no-ipo or /Qipo-  Multifile interprocedural optimization is not enabled.

Description

This option enables interprocedural optimization between files. This is also called multifile interprocedural optimization (multifile IPO) or Whole Program Optimization (WPO).

When you specify this option, the compiler performs inline function expansion for calls to functions defined in separate files.

You cannot specify the names for the files that are created.

If \(n\) is 0, the compiler decides whether to create one or more object files based on an estimate of the size of the application. It generates one object file for small applications, and two or more object files for large applications.

If \(n\) is greater than 0, the compiler generates \(n\) object files, unless \(n\) exceeds the number of source files (\(m\)), in which case the compiler generates only \(m\) object files.

If you do not specify \(n\), the default is 0.

NOTE
When you specify option \([Q]\)ipo with option \([q\ or \ Q]\)opt-report, IPO information is generated in the compiler optimization report at link time. After linking, you will see a report named ipo_out.optrpt in the folder where you linked all of the object files.

IDE Equivalent

Visual Studio: Optimization > Interprocedural Optimization
**Eclipse: Optimization > Enable Whole Program Optimization**

Xcode: None

**Alternate Options**

None

**ipo-c, Qipo-c**

*Tell the compiler to optimize across multiple files and generate a single object file.*

**Syntax**

**Linux OS and macOS:**

-ipo-c

**Windows OS:**

/Qipo-c

**Arguments**

None

**Default**

OFF

The compiler does not generate a multifile object file.

**Description**

This option tells the compiler to optimize across multiple files and generate a single object file (named ipo_out.o on Linux* and macOS* systems; ipo_out.obj on Windows* systems).

It performs the same optimizations as the [Q]ipo option, but compilation stops before the final link stage, leaving an optimized object file that can be used in further link steps.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

ipo, Qipo compiler option

**ipo-jobs, Qipo-jobs**

*Specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO).*

**Syntax**

**Linux OS and macOS:**

-ipo-jobs \( n \)

**Windows OS:**

/Qipo-jobs: \( n \)
Arguments

\( n \)

Is the number of commands (jobs) to run simultaneously. The number must be greater than or equal to 1.

Default

-\( -\)ipo-jobs1

or \( /\)Qipo-jobs:1

One command (job) is executed in an interprocedural optimization parallel build.

Description

This option specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO). It should only be used if the link-time compilation is generating more than one object. In this case, each object is generated by a separate compilation, which can be done in parallel.

This option can be affected by the following compiler options:

- \( [\)Q\]ipo\( ] \) when applications are large enough that the compiler decides to generate multiple object files.
- \( [\)Q\]ipo\( n \) \) when \( n \) is greater than 1.
- \( [\)Q\]ipo-separate\( ] \)

Caution

Be careful when using this option. On a multi-processor system with lots of memory, it can speed application build time. However, if \( n \) is greater than the number of processors, or if there is not enough memory to avoid thrashing, this option can increase application build time.

IDE Equivalent

None

Alternate Options

None

See Also

ipo, Qipo compiler option
ipo-separate, Qipo-separate compiler option

ipo-S, Qipo-S

Tell the compiler to optimize across multiple files and generate a single assembly file.

Syntax

Linux OS and macOS:

-\( -\)ipo-S

Windows OS:

/\)Qipo-S

Arguments

None
**Default**

OFF

The compiler does not generate a multifile assembly file.

**Description**

This option tells the compiler to optimize across multiple files and generate a single assembly file (named ipo_out.s on Linux* and macOS* systems; ipo_out.asm on Windows* systems).

It performs the same optimizations as the [Q]ipo option, but compilation stops before the final link stage, leaving an optimized assembly file that can be used in further link steps.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

ipo, Qipo compiler option

ipo-separate, Qipo-separate

*Tells the compiler to generate one object file for every source file.

**Syntax**

- **Linux OS:**
  - -ipo-separate

- **macOS:**
  - None

- **Windows OS:**
  - /Qipo-separate

**Arguments**

None

**Default**

OFF

The compiler decides whether to create one or more object files.

**Description**

This option tells the compiler to generate one object file for every source file. It overrides any [Q]ipo option specification.

**IDE Equivalent**

None

**Alternate Options**

None
Advanced Optimization Options

alias-const, Qalias-const

_Determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const._

**Syntax**

Linux OS and macOS:

- alias-const
- no-alias-const

Windows OS:

/Qalias-const
/Qalias-const-

**Arguments**

None

**Default**

-no-alias-const  
The compiler uses standard C/C++ rules for the interpretation of const.

or /Qalias-const-

**Description**

This option determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const. It implies an additional attribute for const.

This functionality complies with the input/output buffer rule, which assumes that input and output buffer arguments do not overlap. This option allows the compiler to do some additional optimizations with those parameters.

In C99, you can also get the same result if you additionally declare your pointer parameters with the restrict keyword.

**IDE Equivalent**

Visual Studio: None

Eclipse: **Data > Assume Restrict Semantics for Const**

Xcode: **Data > Assume Restrict Semantics for Const**

**Alternate Options**

None

ansi-alias, Qansi-alias

_Enables or disables the use of ANSI aliasing rules in optimizations._
Syntax

Linux OS and macOS:
- `-ansi-alias`
- `-no-ansi-alias`

Windows OS:
/`Qansi-alias`
/`Qansi-alias-`

Arguments
None

Default

Windows* systems: /`Qansi-alias-`

Linux* and macOS* systems: `-ansi-alias`

Description
This option tells the compiler to assume that the program adheres to ISO C Standard aliasability rules.

If your program adheres to the ANSI aliasability rules, this option allows the compiler to optimize more aggressively. If your program does not adhere to these rules, this option may cause the compiler to generate incorrect code.

If you are compiling on a Linux* or an macOS* system and your program does not adhere to the ANSI aliasability rules, you can specify `-no-ansi-alias` to ensure program correctness.

When you specify the [Q]ansi-alias option, the ansi-alias checker is enabled by default. To disable the ansi-alias checker, you must specify `-no-ansi-alias-check` (Linux* and macOS*) or `/Qansi-alias-check-` (Windows*).

IDE Equivalent

Visual Studio: Language > Enable Use of ANSI Aliasing Rules in Optimizations
Eclipse: Language > Enable Use of ANSI Aliasing Rules in Optimizations
Xcode: Language > Enable ANSI Aliasing

Alternate Options

Linux and macOS*: `-fstrict-aliasing`

Windows: None

See Also
ansi-alias-check, Qansi-alias-check
compiler option

ansi-alias-check, Qansi-alias-check
Enables or disables the ansi-alias checker.
## Syntax

**Linux OS and macOS:**
- `–ansi-alias-check`
- `–no-ansi-alias-check`

**Windows OS:**
- `/Qansi-alias-check`
- `/Qansi-alias-check-`

### Arguments
None

### Default

`–no-ansi-alias-check` or `/Qansi-alias-check-`

The ansi-alias checker is disabled unless option `–ansi-alias-check` or `/Qansi-alias-check-` has been specified.

### Description
This option enables or disables the ansi-alias checker. The ansi-alias checker checks the source code for potential violations of ANSI aliasing rules and disables unsafe optimizations related to the code for those statements that are identified as potential violations.

You can use option `–Wstrict-aliasing` to identify potential violations.

If the `[Q]ansi-alias` option has been specified, the ansi-alias checker is enabled by default. You can use the negative form of the option (see Syntax above) to disable the checker.

### IDE Equivalent
None

### Alternate Options
None

### See Also
ansi-alias, Qansi-alias
compiler option
Wstrict-aliasing
compiler option
cilk-serialize, Qcilk-serialize

Causes serialization of Intel® Cilk™ Plus code. This is a deprecated option. There is no replacement option.

## Syntax

**Linux OS and macOS:**
- `–cilk-serialize`

**Windows OS:**
- `/Qcilk-serialize`
Arguments
None

Default
OFF

The Intel® Cilk™ Plus language extensions are recognized.

Description
This option causes serialization of code that contains Intel® Cilk™ Plus language extensions. This means that the compiler will run the program as if it were a C/C++ serialized program.

This option forces inclusion of a special header file (cilk_stub.h) that includes preprocessor macros that make certain specific keywords that are related to those language extensions invisible to the compiler.

The serialization of a program containing these special language extensions is described in Using Intel® Cilk™ Plus.

NOTE
Vector parallelism, which is generated by the array notations within Intel® Cilk™ Plus, is not affected by this compiler option.

IDE Equivalent
Visual Studio: Language > Replace Intel Cilk Plus Keywords With Serial Equivalents
Eclipse: Language > Replace Intel Cilk Plus Keywords With Serial Equivalents
Xcode: Language > Serialize Program

Alternate Options
None

See Also
intel-extensions, Qintel-extensions compiler option
complex-limited-range, Qcomplex-limited-range

Determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.

Syntax
Linux OS and macOS:
- complex-limited-range
- no-complex-limited-range

Windows OS:
/Qcomplex-limited-range
/Qcomplex-limited-range-
Default

-no-complex-limited-range  or /Qcomplex-limited-range-

Basic algebraic expansions of some arithmetic operations involving data of type COMPLEX are disabled.

Description

This option determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.

When the option is enabled, this can cause performance improvements in programs that use a lot of COMPLEX arithmetic. However, values at the extremes of the exponent range may not compute correctly.

IDE Equivalent

Visual Studio: **Floating Point > Limit COMPLEX Range**

Eclipse: **Floating Point > Limit COMPLEX Range**

Xcode: **Floating Point > Limit COMPLEX Range**

Alternate Options

None

daal, Qdaal

*Tells the compiler to link to certain libraries in the Intel® Data Analytics Acceleration Library (Intel® DAAL).*

Architecture Restrictions

Not available on Intel® 64 architecture targeting the Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing)

Syntax

Linux OS and macOS:

-`daal[=lib]`

Windows OS:

/Qdaal[:lib]

Arguments

*lib*

Indicates which Intel® DAAL library files should be linked. Possible values are:

- `parallel`  
  Tells the compiler to link using the threaded Intel® DAAL libraries. This is the default if the option is specified with no `lib`

- `sequential`  
  Tells the compiler to link using the non-threaded Intel® DAAL libraries.

Default

OFF  

The compiler does not link to the Intel® DAAL.
Description
This option tells the compiler to link to certain libraries in the Intel® Data Analytics Acceleration Library (Intel® DAAL).

On Linux* and macOS* systems, the associated Intel® DAAL headers are included when you specify this option.

NOTE
On Windows* systems, this option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker. On Linux* and macOS* systems, this option is processed by theicc/icpc command that initiates linking, adding library names explicitly to the link command.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

IDE Equivalent
Visual Studio: None

Eclipse: Performance Library Build Components -> Use Intel(R) Data Analytics Acceleration Library

Xcode: Performance Library Build Components -> Use Intel® Data Analytics Acceleration Library

Alternate Options
None

See Also
Using Intel® Performance Libraries

fargument-alias, Qalias-args
Determines whether function arguments can alias each other.

Syntax

Linux OS and macOS:
-fargument-alias
-fargument-noalias

Windows OS:
/Qalias-args
/Qalias-args-
Arguments
None

Default

-fargument-alias or /Qalias-args
Function arguments can alias each other and can alias global storage.

Description
This option determines whether function arguments can alias each other. If you specify
-fargument-noalias or /Qalias-args-, function arguments cannot alias each other, but they can alias
global storage.

On Linux and macOS* systems, you can also disable aliasing for global storage, by specifying option
-fargument-noalias-global.

IDE Equivalent
Visual Studio: None
Eclipse: Data > Enable Argument Aliasing
Xcode: Data > Enable Argument Aliasing

See Also
fargument-noalias-global compiler option

Syntax
Linux OS and macOS:
-fargument-noalias-global

Windows OS:
None

Arguments
None

Default
OFF
Function arguments can alias each other and can alias global storage.

Description
This option tells the compiler that function arguments cannot alias each other and they cannot alias global
storage.

If you only want to prevent function arguments from being able to alias each other, specify option
-fargument-noalias.

IDE Equivalent
None
Alternate Options
None

See Also
fargument-alias, Qalias-args
compiler option

ffreestanding, Qfreestanding
Ensures that compilation takes place in a freestanding environment.

Syntax
Linux OS and macOS:
-ffreestanding

Windows OS:
/Qfreestanding

Arguments
None

Default
OFF

Standard libraries are used during compilation.

Description
This option ensures that compilation takes place in a freestanding environment. The compiler assumes that the standard library may not exist and program startup may not necessarily be at main. This environment meets the definition of a freestanding environment as described in the C and C++ standard.

An example of an application requiring such an environment is an OS kernel.

NOTE
When you specify this option, the compiler will not assume the presence of compiler-specific libraries. It will only generate calls that appear in the source code.

IDE Equivalent
None

Alternate Options
None

fjump-tables
Determines whether jump tables are generated for switch statements.

Syntax
Linux OS and macOS:
fjump-tables

-fjump-tables
-fno-jump-tables

Windows OS:
None

Arguments
None

Default
-fjump-tables

The compiler may use jump tables for switch statements.

Description
This option determines whether jump tables are generated for switch statements.

Option `-fno-jump-tables` prevents the compiler from generating jump tables for switch statements. This action is performed unconditionally and independent of any generated code performance consideration.

Option `-fno-jump-tables` also prevents the compiler from creating switch statements internally as a result of optimizations.

Use `-fno-jump-tables` with `-fpic` when compiling objects that will be loaded in a way where the jump table relocation cannot be resolved.

IDE Equivalent
None

Alternate Options
None

See Also
- `fpic` compiler option

-ftls-model

Changes the thread local storage (TLS) model.

Syntax

Linux OS and macOS:
-ftls-model=model

Windows OS:
None

Arguments
$model$

Determined the TLS model used by the compiler. Possible values are:

`global-dynamic`

Generates a generic TLS code. The code can be used everywhere and the code can access variables defined anywhere else. This setting causes the largest size code to be generated and uses the most run time to produce.
local-dynamic  Generates an optimized TLS code. To use this setting, the thread-local variables must be defined in the same object in which they are referenced.

initial-exec  Generates a restrictive, optimized TLS code. To use this setting, the thread-local variables accessed must be defined in one of the modules available to the program.

local-exec  Generates the most restrictive TLS code. To use this setting, the thread-local variables must be defined in the executable.

Default
OFF  The compiler uses default heuristics when determining the thread-local storage model.

Description
This option changes the thread local storage (TLS) model. Thread-local storage is a mechanism by which variables are allocated in a way that causes one instance of the variable per extant thread.

For more information on the thread-storage localization models, see the appropriate gcc* documentation.
For more information on the thread-storage localization models, see the appropriate clang* documentation.

IDE Equivalent
None

Alternate Options
None

funroll-all-loops
Unroll all loops even if the number of iterations is uncertain when the loop is entered.

Syntax
Linux OS and macOS:
-funroll-all-loops

Windows OS:
None

Arguments
None

Default
OFF  Do not unroll all loops.

Description
Unroll all loops, even if the number of iterations is uncertain when the loop is entered. There may a performance impact with this option.
IDE Equivalent
None

Alternate Options
None

guide, Qguide
Lets you set a level of guidance for auto-vectorization, auto parallelism, and data transformation.

Syntax

Linux OS and macOS:
-guide [=n]

Windows OS:
/Qguide[:n]

Arguments

n Is an optional value specifying the level of guidance to be provided.
The values available are 1 through 4. Value 1 indicates a standard level of guidance. Value 4 indicates the most advanced level of guidance. If n is omitted, the default is 4.

Default
OFF You do not receive guidance about how to improve optimizations for parallelism, vectorization, and data transformation.

Description

This option lets you set a level of guidance (advice) for auto-vectorization, auto parallelism, and data transformation. It causes the compiler to generate messages suggesting ways to improve these optimizations.

When this option is specified, the compiler does not produce any objects or executables.

You must also specify the [Q]parallel option to receive auto parallelism guidance.

You can set levels of guidance for the individual guide optimizations by specifying one of the following options:

[Q]guide-par Provides guidance for auto parallelism.
[Q]guide-vec Provides guidance for auto-vectorization.

If you specify the [Q]guide option and also specify one of the options setting a level of guidance for an individual guide optimization, the value set for the individual guide optimization will override the setting specified in [Q]guide.

If you do not specify [Q]guide, but specify one of the options setting a level of guidance for an individual guide optimization, option [Q]guide is enabled with the greatest value passed among any of the three individual guide optimizations specified.
In debug mode, this option has no effect unless option O2 (or higher) is explicitly specified in the same command line.

NOTE
The compiler speculatively performs optimizations as part of guide analysis. As a result, when you use guided auto-parallelism options with options that produce vectorization or auto-parallelizer reports (such as option [q or Q]opt-report), the compiler generates "LOOP WAS VECTORIZED" or similar messages as if the compilation was performed with the recommended changes.

When compilation is performed with the [Q]guide option, you should use extra caution when interpreting vectorizer diagnostics and auto-parallelizer diagnostics.

NOTE
You can specify [Q]diag-disable to prevent the compiler from issuing one or more diagnostic messages.

IDE Equivalent
Visual Studio: Diagnostics > Guided Auto Parallelism Analysis
Eclipse: Compilation Diagnostics > Enable Guided Auto Parallelism Analysis
Xcode: Diagnostics > Enable Guided Auto Parallelism Analysis

Alternate Options
None

See Also
guide-data-trans, Qguide-data-trans compiler option

guide-file-append, Qguide-file-append compiler option
guide-opts, Qguide-opts compiler option
diag, Qdiag compiler option
qopt-report, Qopt-report compiler option

guide-data-trans, Qguide-data-trans
Lets you set a level of guidance for data transformation.

Syntax

Linux OS and macOS:
-guide-data-trans[=n]

Windows OS:
/Qguide-data-trans[:n]
**Arguments**

\( n \)  
Is an optional value specifying the level of guidance to be provided.

The values available are 1 through 4. Value 1 indicates a standard level of guidance. Value 4 indicates the most advanced level of guidance. If \( n \) is omitted, the default is 4.

**Default**

OFF  
You do not receive guidance about how to improve optimizations for data transformation.

**Description**

This option lets you set a level of guidance for data transformation. It causes the compiler to generate messages suggesting ways to improve that optimization.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

guide, Qguide compiler option  
guide-par, Qguide-par compiler option  
guide-vec, Qguide-vec compiler option  
guide-file, Qguide-file compiler option

**Syntax**

**Linux OS and macOS:**

- `-guide-file=[filename]`

**Windows OS:**

- `/Qguide-file=[filename]`

**Arguments**

\( filename \)  
Is the name of the file for output. It can include a path.

**Default**

OFF  
Messages that are generated by guided auto parallelism are output to stderr.

**Description**

This option causes the results of guided auto parallelism to be output to a file.

This option is ignored unless you also specify one or more of the following options:
• [Q]guide
• [Q]guide-vec
• [Q]guide-data-trans
• [Q]guide-par

If you do not specify a path, the file is placed in the current working directory.

If there is already a file named filename, it will be overwritten.

You can include a file extension in filename. For example, if file.txt is specified, the name of the output file is file.txt. If you do not provide a file extension, the name of the file is filename.guide.

If you do not specify filename, the name of the file is name-of-the-first-source-file.guide. This is also the name of the file if the name specified for filename conflicts with a source file name provided in the command line.

**NOTE**
If you specify the [Q]guide-file option and you also specify option [Q]guide-file-append, the last option specified on the command line takes precedence.

**IDE Equivalent**

Visual Studio: Diagnostics > Emit Guided Auto Parallelism Diagnostics to File
Diagnostics > Guided Auto Parallelism Diagnostics File

Eclipse: Compilation Diagnostics > Emit Guided Auto Parallelism diagnostics to File
Compilation Diagnostics > Guided Auto Parallelism Report File

Xcode: Diagnostics > Emit Guided Auto Parallelism diagnostics to File
Diagnostics > Guided Auto Parallelism Report File

**Alternate Options**

None

**Example**

The following example shows how to cause guided auto parallelism messages to be output to a file named my_guided_autopar.guide:

```bash
-guide-file=my_guided_autopar  ! Linux and macOS* systems
-Qguide-file:my_guided_autopar  ! Windows systems
```

**See Also**

guide, Qguide compiler option
guide-file-append, Qguide-file-append compiler option

**guide-file-append, Qguide-file-append**
Causes the results of guided auto parallelism to be appended to a file.

**Syntax**

Linux OS and macOS:

```bash
-guide-file-append[=filename]
```
**Windows OS:**

/Qguide-file-append[:filename]

**Arguments**

*filename*

Is the name of the file to be appended to. It can include a path.

**Default**

OFF

Messages that are generated by guided auto parallelism are output to stderr.

**Description**

This option causes the results of guided auto parallelism to be appended to a file.

This option is ignored unless you also specify one or more of the following options:

- [Q]guide
- [Q]guide-vec
- [Q]guide-data-trans
- [Q]guide-par

If you do not specify a path, the compiler looks for *filename* in the current working directory.

If *filename* is not found, then a new file with that name is created in the current working directory.

If you do not specify a file extension, the name of the file is *filename.guide*.

If the name specified for *filename* conflicts with a source file name provided in the command line, the name of the file is *name-of-the-first-source-file.guide*.

**NOTE**

If you specify the [Q]guide-file-append option and you also specify option [Q]guide-file, the last option specified on the command line takes precedence.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

The following example shows how to cause guided auto parallelism messages to be appended to a file named *my_messages.txt*:

- `guide-file-append=my_messages.txt`  ! Linux and macOS* systems
- `/Qguide-file-append:my_messages.txt` ! Windows systems

**See Also**

`guide`, `Qguide` compiler option
`guide-file`, `Qguide-file` compiler option
guide-opts, Qguide-opts
Tells the compiler to analyze certain code and generate recommendations that may improve optimizations.

Syntax

Linux OS and macOS:
-guide-opts=string

Windows OS:
/Qguide-opts:string

Arguments

string
Is the text denoting the code to analyze. The string must appear within quotes. It can take one or more of the following forms:

<table>
<thead>
<tr>
<th>filename</th>
<th>Specifies the name of a file to be analyzed. It can include a path. If you do not specify a path, the compiler looks for filename in the current working directory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename, routine</td>
<td>Specifies the name of a routine to be analyzed. You can include an identifying parameter. The name, including any parameter, must be enclosed in single quotes. The compiler tries to uniquely identify the routine that corresponds to the specified routine name. It may select multiple routines to analyze, especially if the following is true:</td>
</tr>
<tr>
<td></td>
<td>• More than one routine has the specified routine name, so the routine cannot be uniquely identified.</td>
</tr>
<tr>
<td></td>
<td>• No parameter information has been specified to narrow the number of routines selected as matches.</td>
</tr>
<tr>
<td>filename, range [, range]...</td>
<td>Specifies a range of line numbers to analyze in the file or routine specified. The range must be specified in integers in the form:</td>
</tr>
<tr>
<td>filename, routine, range [, range]...</td>
<td></td>
</tr>
</tbody>
</table>
**Default**

OFF  
You do not receive guidance on how to improve optimizations. However, if you specify the \[Q\]guide option, the compiler analyzes and generates recommendations for all the code in an application.

**Description**

This option tells the compiler to analyze certain code and generate recommendations that may improve optimizations.

This option is ignored unless you also specify one or more of the following options:

- \[Q\]guide
- \[Q\]guide-vec
- \[Q\]guide-data-trans
- \[Q\]guide-par

When the \[Q\]guide-opts option is specified, a message is output that includes which parts of the input files are being analyzed. If a routine is selected to be analyzed, the complete routine name will appear in the generated message.

When inlining is involved, you should specify callee line numbers. Generated messages also use callee line numbers.

**IDE Equivalent**

Visual Studio: Diagnostics > Guided Auto Parallelism Code Selection Options
Eclipse: Compilation Diagnostics > Guided Auto Parallelism Code Selection
Xcode: Diagnostics > Guided Auto Parallelism Code Selection

**Alternate Options**

None

**Example**

Consider the following:

Linux*: -guide-opts="v.c, 1-10; v2.c, 1-40, 50-90, 100-200; v5.c, 300-400; x.c, 'funca(int)', 22-44, 55-77, 88-99; y.c, 'funcb'"

Windows*: /Qguide-opts:"v.c, 1-10; v2.c, 1-40, 50-90, 100-200; v5.c, 300-400; x.c, 'funca(int)', 22-44, 55-77, 88-99; y.c, 'funcb'"

The above command causes the following to be analyzed:

<table>
<thead>
<tr>
<th>File</th>
<th>Line Numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>file v.c</td>
<td>line numbers 1 to 10</td>
</tr>
<tr>
<td>file v2.c</td>
<td>line numbers 1 to 40, 50 to 90, and 100 to 200</td>
</tr>
<tr>
<td>file v5.c</td>
<td>line numbers 300 to 400</td>
</tr>
<tr>
<td>file x.c</td>
<td>routine funca with parameter (int), line numbers 22 to 44, 55 to 77, and 88 to 99</td>
</tr>
<tr>
<td>file y.c</td>
<td>routine funcb</td>
</tr>
</tbody>
</table>

guide-par, Qguide-par compiler option
guide-vec, Qguide-vec compiler option
guide-file, Qguide-file compiler option

guide-par, Qguide-par
Lets you set a level of guidance for auto parallelism.

Syntax

Linux OS and macOS:
- guide-par [=n]

Windows OS:
/Qguide-par[:n]

Arguments

n
Is an optional value specifying the level of guidance to be provided.
The values available are 1 through 4. Value 1 indicates a standard level of
guidance. Value 4 indicates the most advanced level of guidance. If n is
omitted, the default is 4.

Default

OFF
You do not receive guidance about how to improve optimizations for
parallelism.

Description

This option lets you set a level of guidance for auto parallelism. It causes the compiler to generate messages
suggesting ways to improve that optimization.

You must also specify the [Q]parallel option to receive auto parallelism guidance.

IDE Equivalent

None

Alternate Options

None

See Also

guide, Qguide compiler option

guide-vec, Qguide-vec compiler option
guide-file, Qguide-file compiler option

guide-profile, Qguide-profile
Specifies a loop profiler data file (or a set of files)
when used with option -guide or /Qguide.
Syntax

Linux OS and macOS:

```
-guide-profile=filename|dir [, [filename|dir]...]
```

Windows OS:

```
/Qguide-profile:filename|dir [, [filename|dir]...]
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Is an .xml file created from a loop profiler run.</td>
</tr>
<tr>
<td><code>dir</code></td>
<td>Is a directory that contains one or more .xml files from a loop profiler run.</td>
</tr>
</tbody>
</table>

Default

OFF

When the `Q`guide option is specified, the guide region is the whole file or the region specified by option `Q`guide-opts.

Description

This option specifies a loop profiler data file (or a set of files) when used with the `Q`guide option. This option has no effect unless the `Q`guide option has been specified. Option `Q`guide-profile helps you take advantage of the `Q`guide option to more efficiently optimize your applications for auto parallelism and/or vectorization.

The loop profile data file can be collected by using one of the following options:

- `Q`profile-loops
- `Q`profile-functions

When the data is from `Q`profile-loops, the setting of the guide regions will be based upon the hottest loops.

When the data is from `Q`profile-functions, the guide region will be the entire function containing the hottest functions.

If you specify options `Q`guide-opts and `Q`guide-profile, the compiler issues an error message.

IDE Equivalent

ipp, Qipp

 Tells the compiler to link to the some or all of the
Intel® Integrated Performance Primitives (Intel® IPP)
libraries.

Syntax

Linux OS and macOS:

-ipp[=lib]

Windows OS:

/Qipp[:lib]

Arguments

$lib$

Indicates the Intel® IPP libraries that the compiler should link to. Possible values are:

common

Tells the compiler to link using the main libraries set. This is the default if the option is specified with
no $lib$. 
crypto
Tells the compiler to link using the Intel® IPP Cryptography libraries.

nonpic (Linux* only)
Tells the compiler to link using the version of the libraries that do not have position-independent code.

nonpic_crypto (Linux only)
Tells the compiler to link using the Intel® IPP Cryptography libraries. It uses the version of the libraries that do not have position-independent code.

Default
OFF
The compiler does not link to the Intel® IPP libraries.

Description
The option tells the compiler to link to the some or all of the Intel® Integrated Performance Primitives (Intel® IPP) libraries and include the Intel® IPP headers.

The \[Q\]ipp-link option controls whether the compiler links to static, dynamic threaded, or static threaded Intel® IPP run-time libraries.

NOTE
On Windows* systems, this option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker. On Linux* and macOS* systems, this option is processed by the icc/icpc command that initiates linking, adding library names explicitly to the link command.

Optimization Notice
Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

**ipp-link, Qipp-link**

*Controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.*

**Syntax**

**Linux OS and macOS:**

-ipp-link[=lib]

**Windows OS:**

/Qipp-link[:lib]

**Arguments**

<table>
<thead>
<tr>
<th>lib</th>
<th>Specifies the Intel® IPP library to use. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>Tells the compiler to link to the set of static run-time libraries.</td>
</tr>
<tr>
<td>dynamic</td>
<td>Tells the compiler to link to the set of dynamic threaded run-time libraries.</td>
</tr>
</tbody>
</table>

**Default**

**dynamic**

The compiler links to the Intel® IPP set of dynamic run-time libraries. However, if Linux* option -static is specified, the compiler links to the set of static run-time libraries.

**Description**

This option controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.

To use this option, you must also specify the [Q]ipp option.

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. ipp, Qipp compiler option

mkl, Qmkl
Tells the compiler to link to certain libraries in the Intel® Math Kernel Library (Intel® MKL). On Windows systems, you must specify this option at compile time.

Syntax
Linux OS and macOS:
-mkl[=lib]

Windows OS:
/Qmkl[=lib]

Arguments

<table>
<thead>
<tr>
<th>lib</th>
<th>Indicates which Intel® MKL library files should be linked. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallel</td>
<td>Tells the compiler to link using the threaded libraries in the Intel® MKL. This is the default if the option is specified with no lib.</td>
</tr>
<tr>
<td>sequential</td>
<td>Tells the compiler to link using the sequential libraries in the Intel® MKL.</td>
</tr>
<tr>
<td>cluster</td>
<td>Tells the compiler to link using the cluster-specific libraries and the sequential libraries in the Intel® MKL. Cluster-specific libraries are not available for macOS*.</td>
</tr>
</tbody>
</table>

Default
OFF

The compiler does not link to the Intel® MKL.

Description
This option tells the compiler to link to certain libraries in the Intel® Math Kernel Library (Intel® MKL).

On Linux* and macOS* systems, dynamic linking is the default when you specify -mkl. To link with Intel® MKL statically, you must specify:

-mkl -static-intel

On Windows* systems, static linking is the default when you specify /Qmkl. To link with Intel® MKL dynamically, you must specify:

/Qmkl /MD

For more information about using MKL libraries, see the article in Intel® Developer Zone titled: Intel® Math Kernel Library Link Line Advisor, which is located in https://software.intel.com/en-us/articles/intel-mkl-link-line-advisor.
NOTE
On Windows* systems, this option adds directives to the compiled code, which the linker then reads without further input from the driver. On Linux* and macOS* systems, the driver must add the library names explicitly to the link command.

NOTE
If you specify option [Q]mkl or [Q]mkl=parallel, and you also specify option [Q]tbb, the compiler links to the standard threaded version of the Intel® MKL. However, if you specify [Q]mkl or [Q]mkl=parallel, and you also specify option [Q]tbb and option [q or Q]openmp, the compiler links to the OpenMP* threaded version of the Intel® MKL.

qopt-args-in-regs, Qopt-args-inregs
Determine whether calls to routines are optimized by passing parameters in registers instead of on the stack.

Architecture Restrictions
Only available on IA-32 architecture

Syntax
Linux OS:
-qopt-args-in-regs=[keyword]
macOS:
None

Windows OS:
/Qopt-args-in-regs[:keyword]

**Arguments**

*keyword* Specifies whether the optimization should be performed and under what conditions. Possible values are:

- **none**: The optimization is not performed. No parameters are passed in registers. They are put on the stack.
- **seen**: Causes parameters to be passed in registers when they are passed to routines whose definition can be seen in the same compilation unit.
- **all**: Causes parameters to be passed in registers, whether they are passed to routines whose definition can be seen in the same compilation unit, or not. This value is only available on Linux* systems.

**Default**

- `-qopt-args-in-regs=seen`
or
- `/Qopt-args-in-regs:seen`

Parameters are passed in registers when they are passed to routines whose definition is seen in the same compilation unit.

**Description**

This option determines whether calls to routines are optimized by passing parameters in registers instead of on the stack. It also indicates the conditions when the optimization will be performed.

This option can improve performance for Application Binary Interfaces (ABIs) that require parameters to be passed in memory and compiled without interprocedural optimization (IPO).

Note that on Linux* systems, if **all** is specified, a small overhead may be paid when calling "unseen" routines that have not been compiled with the same option. This is because the call will need to go through a "thunk" to ensure that parameters are placed back on the stack where the callee expects them.

**IDE Equivalent**

None

**Alternate Options**

None

**qopt-assume-safe-padding, Qopt-assume-safe-padding**

*Determine* whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.

**Architecture Restrictions**

Only available on all architectures that support Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions.
Syntax

Linux OS and macOS:
-qopt-assume-safe-padding
-qno-opt-assume-safe-padding

Windows OS:
/Qopt-assume-safe-padding
/Qopt-assume-safe-padding-

Arguments
None

Default
-qno-opt-assume-safe-padding or /Qopt-assume-safe-padding-
The compiler will not assume that variables and dynamically allocated memory are padded past the end of the object. It will adhere to the sizes specified in your program.

Description
This option determines whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.

When you specify option [q or Q]opt-assume-safe-padding, the compiler assumes that variables and dynamically allocated memory are padded. This means that code can access up to 64 bytes beyond what is specified in your program.

The compiler does not add any padding for static and automatic objects when this option is used, but it assumes that code can access up to 64 bytes beyond the end of the object, wherever the object appears in the program. To satisfy this assumption, you must increase the size of static and automatic objects in your program when you use this option.

This option may improve performance of memory operations.

IDE Equivalent
None

Alternate Options
None

qopt-block-factor, Qopt-block-factor
Lets you specify a loop blocking factor.

Syntax

Linux OS and macOS:
-qopt-block-factor=n

Windows OS:
/Qopt-block-factor:n
Arguments

Is the blocking factor. It must be an integer. The compiler may ignore the
blocking factor if the value is 0 or 1.

Default

OFF

The compiler uses default heuristics for loop blocking.

Description

This option lets you specify a loop blocking factor.

IDE Equivalent

Visual Studio: Diagnostics > Optimization Diagnostic File
Diagnostics > Emit Optimization Diagnostics to File
Eclipse: None
Xcode: None

Alternate Options

None

qopt-calloc

Tells the compiler to substitute a call to
_intel_fast_calloc() for a call to calloc().

Syntax

Linux OS:
-qopt-calloc
-qno-opt-calloc

macOS:
None

Windows OS:
None

Arguments

None

Default

-qno-opt-calloc

The compiler does not substitute a call to _intel_fast_calloc() for a call to
calloc().

Description

This option tells the compiler to substitute a call to _intel_fast_calloc() for a call to calloc().

This option may increase the performance of long-running programs that use calloc() frequently. It is
recommended for these programs over combinations of options -inline-calloc and
-qopt-malloc-options=3 because this option causes less memory fragmentation.
Many routines in the LIBIRC library are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

**IDE Equivalent**
None

**Alternate Options**
None

**qopt-class-analysis, Qopt-class-analysis**
Determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time.

**Syntax**

**Linux OS and macOS:**
- `-qopt-class-analysis`
- `-qno-opt-class-analysis`

**Windows OS:**
/`Qopt-class-analysis`
/`Qopt-class-analysis-`

**Arguments**
None

**Default**
- `-qno-opt-class-analysis` or `/Qopt-class-analysis-`
  C++ class hierarchy information is not used to analyze and resolve C++ virtual function calls at compile time.

**Description**
This option determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time. The option is turned on by default with the `-ipo` compiler option, enabling improved C++ optimization. If a C++ application contains non-standard C++ constructs, such as pointer down-casting, it may result in different behaviors.

**IDE Equivalent**
None

**Alternate Options**
None

**qopt-dynamic-align, Qopt-dynamic-align**
Enables or disables dynamic data alignment optimizations.
Syntax

Linux OS and macOS:
- `qopt-dynamic-align`
- `qno-opt-dynamic-align`

Windows OS:
- `/Qopt-dynamic-align`
- `/Qopt-dynamic-align-`

Arguments
None

Default
- `qopt-dynamic-align`
  - or `/Qopt-dynamic-align`

The compiler may generate code dynamically dependent on alignment. It may do optimizations based on data location for the best performance. The result of execution on some algorithms may depend on data layout.

Description
This option enables or disables dynamic data alignment optimizations.

If you specify `qno-opt-dynamic-align` or `/Qopt-dynamic-align-`, the compiler generates no code dynamically dependent on alignment. It will not do any optimizations based on data location and results will depend on the data values themselves.

When you specify `[q or Q]opt-dynamic-align`, the compiler may implement conditional optimizations based on dynamic alignment of the input data. These dynamic alignment optimizations may result in different bitwise results for aligned and unaligned data with the same values.

Dynamic alignment optimizations can improve the performance of vectorized code, especially for long trip count loops. Disabling such optimizations can decrease performance, but it may improve bitwise reproducibility of results, factoring out data location from possible sources of discrepancy.

IDE Equivalent
None

Alternate Options
None

qopt-jump-tables, Qopt-jump-tables

Enables or disables generation of jump tables for switch statements.

Syntax

Linux OS and macOS:
- `qopt-jump-tables=keyword`
- `qno-opt-jump-tables`

Windows OS:
- `/Qopt-jump-tables:keyword`
- `/Qopt-jump-tables-`
Arguments

**keyword**

Is the instruction for generating jump tables. Possible values are:

- **never**
  
  Tells the compiler to never generate jump tables. All switch statements are implemented as chains of if-then-elses. This is the same as specifying `-qno-opt-jump-tables` (Linux* and macOS*) or `/Qopt-jump-tables-` (Windows*).

- **default**
  
  The compiler uses default heuristics to determine when to generate jump tables.

- **large**
  
  Tells the compiler to generate jump tables up to a certain pre-defined size (64K entries).

- **n**
  
  Must be an integer. Tells the compiler to generate jump tables up to n entries in size.

Default

- **-qopt-jump-tables=default**
- **/Qopt-jump-tables:default**
  
  The compiler uses default heuristics to determine when to generate jump tables for switch statements.

Description

This option enables or disables generation of jump tables for switch statements. When the option is enabled, it may improve performance for programs with large switch statements.

IDE Equivalent

None

Alternate Options

None

**qopt-malloc-options**

*Let you specify an alternate algorithm for malloc().*

Syntax

**Linux OS and macOS:**

- **-qopt-malloc-options=n**

**Windows OS:**

None

Arguments

**n**

Specifies the algorithm to use for malloc(). Possible values are:

- **0**
  
  Tells the compiler to use the default algorithm for malloc(). This is the default.
Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=2 and M_TRIM_THRESHOLD=0x10000000.

Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=2 and M_TRIM_THRESHOLD=0x40000000.

Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=0 and M_TRIM_THRESHOLD=-1.

Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=0, M_TRIM_THRESHOLD=-1, M_TOP_PAD=4096.

Default
-qopt-malloc-options=0 The compiler uses the default algorithm when malloc() is called. No call is made to mallopt().

Description
This option lets you specify an alternate algorithm for malloc().

If you specify a non-zero value for \( n \), it causes alternate configuration parameters to be set for how malloc() allocates and frees memory. It tells the compiler to insert calls to mallopt() to adjust these parameters to malloc() for dynamic memory allocation. This may improve speed.

IDE Equivalent
None

Alternate Options
None

malloc(3) man page
mallopt function (defined in malloc.h)

qopt-matmul, Qopt-matmul
Enables or disables a compiler-generated Matrix Multiply (matmul) library call.

Syntax
Linux OS:
-qopt-matmul
-qno-opt-matmul

macOS:
None

Windows OS:
/Qopt-matmul
/Qopt-matmul-
Arguments
None

Default
-qno-opt-matmul or /Qopt-matmul-
The matmul library call optimization does not occur unless this option is enabled or certain other compiler options are specified (see below).

Description
This option enables or disables a compiler-generated Matrix Multiply (MATMUL) library call.
The \([q\text{ or } Q]opt\text{-matmul}\) option tells the compiler to identify matrix multiplication loop nests (if any) and replace them with a matmul library call for improved performance. The resulting executable may get additional performance gain on Intel® microprocessors than on non-Intel microprocessors.

**NOTE**
This option is dependent upon the OpenMP* library. If your product does not support OpenMP, this option will have no effect.

This option is enabled by default if options \(O3\) and \([Q]\text{parallel}\) are specified. To disable this optimization, specify \(-qno-opt-matmul\) or \(/Qopt-matmul-\).

This option has no effect unless option \(O2\) or higher is set.

**NOTE**
Many routines in the MATMUL library are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

IDE Equivalent
Visual Studio: **Optimization > Enable Matrix Multiply Library Call**
Eclipse: **Optimization > Optimize Matrix Multiplication**
Xcode: None

Alternate Options
None

See Also
-o compiler option

**qopt-mem-layout-trans, Qopt-mem-layout-trans**
Controls the level of memory layout transformations performed by the compiler.

Syntax
**Linux OS and macOS:**
- -qopt-mem-layout-trans=[n]
- -qno-opt-mem-layout-trans
Windows OS:
/Qopt-mem-layout-trans[:n]
/Qopt-mem-layout-trans-

Arguments

n Is the level of memory layout transformations. Possible values are:

0 Disables memory layout transformations. This is the same as specifying -qno-opt-mem-layout-trans (Linux* and macOS*)
or /Qopt-mem-layout-trans- (Windows*).

1 Enables basic memory layout transformations.

2 Enables more memory layout transformations. This is the same as specifying [q or Q]opt-mem-layout-trans with no argument.

3 Enables aggressive memory layout transformations. You should only use this setting if your system has more than 4GB of physical memory per core.

Default

-qopt-mem-layout-trans=2 The compiler performs moderate memory layout transformations.
or
/Qopt-mem-layout-trans:2

Description

This option controls the level of memory layout transformations performed by the compiler. This option can improve cache reuse and cache locality.

Optimization Notice

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

IDE Equivalent

None

Alternate Options

None
**qopt-multi-version-aggressive, Qopt-multi-version-aggressive**
*Tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement.*

**Syntax**

**Linux OS and macOS:**
- `-qopt-multi-version-aggressive`
- `-qno-opt-multi-version-aggressive`

**Windows OS:**
- `/Qopt-multi-version-aggressive`
- `/Qopt-multi-version-aggressive-`

**Arguments**

None

**Default**

- `-qno-opt-multi-version-aggressive`
  or
- `/Qopt-multi-version-aggressive-`

**Description**

This option tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement. This option may improve performance.

The performance can be affected by certain options, such as `/arch` or `/Qx` (Windows*) or `-m` or `-x` (Linux* and macOS*).

**IDE Equivalent**

None

**Alternate Options**

None

**qopt-prefetch, Qopt-prefetch**
*Enables or disables prefetch insertion optimization.*

**Syntax**

**Linux OS and macOS:**
- `-qopt-prefetch[n]`
- `-qno-opt-prefetch`

**Windows OS:**
- `/Qopt-prefetch[:n]`
- `/Qopt-prefetch-`
Arguments

\( n \) Is the level of software prefetching optimization desired. Possible values are:

0 Disables software prefetching. This is the same as specifying \(-qno-opt-prefetch\) (Linux* and macOS*) or \( /Qopt-prefetch-\) (Windows*).

1 to 5 Enables different levels of software prefetching. If you do not specify a value for \( n \), the default is 2. Use lower values to reduce the amount of prefetching.

Default

\(-qno-opt-prefetch\) or \( /Qopt-prefetch-\) Prefetch insertion optimization is disabled.

Description

This option enables or disables prefetch insertion optimization. The goal of prefetching is to reduce cache misses by providing hints to the processor about when data should be loaded into the cache. This option enables prefetching when higher optimization levels are specified.

IDE Equivalent

Visual Studio: None

Eclipse: **Optimization > Enable Prefetch Insertion**

Xcode: **Optimization > Enable Prefetch Insertion**

Alternate Options

None

See Also

\( \text{qopt-prefetch-distance, Qopt-prefetch-distance} \) compiler option

\( \text{qopt-prefetch-distance, Qopt-prefetch-distance} \)

Specifies the prefetch distance to be used for compiler-generated prefetches inside loops.

Syntax

Linux OS:
\(-\text{qopt-prefetch-distance}=n1[, n2]\)

macOS:
None

Windows OS:
\( /\text{Qopt-prefetch-distance}:n1[, n2] \)
**Arguments**

$n1, n2$

Is the prefetch distance in terms of the number of (possibly-vectorized) iterations. Possible values are non-negative numbers $\geq 0$.

$n2$ is optional.

$n1 = 0$ turns off all compiler issued prefetches from memory to L2. $n2 = 0$ turns off all compiler issued prefetches from L2 to L1. If $n2$ is specified and $n1 > 0$, $n1$ should be $\geq n2$.

**Default**

OFF

The compiler uses default heuristics to determine the prefetch distance.

**Description**

This option specifies the prefetch distance to be used for compiler-generated prefetches inside loops. The unit ($n1$ and optionally $n2$) is the number of iterations. If the loop is vectorized by the compiler, the unit is the number of vectorized iterations.

The value of $n1$ will be used as the distance for prefetches from memory to L2 (for example, the vprefetch1 instruction). If $n2$ is specified, it will be used as the distance for prefetches from L2 to L1 (for example, the vprefetch0 instruction).

This option is ignored if option `-qopt-prefetch=0` (Linux*) or `/Qopt-prefetch:0` (Windows*) is specified. When targeting Intel® Xeon Phi™ products, `-qopt-prefetch=3` and `/Qopt-prefetch:3` is the default at option levels O2 and above.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

Consider the following Linux* examples:

```
-qopt-prefetch-distance=64,32
```

The above causes the compiler to use a distance of 64 iterations for memory to L2 prefetches, and a distance of 32 iterations for L2 to L1 prefetches.

```
-qopt-prefetch-distance=24
```

The above causes the compiler to use a distance of 24 iterations for memory to L2 prefetches. The distance for L2 to L1 prefetches will be determined by the compiler.

```
-qopt-prefetch-distance=0,4
```

The above turns off all memory to L2 prefetches inserted by the compiler inside loops. The compiler will use a distance of 4 iterations for L2 to L1 prefetches.

```
-qopt-prefetch-distance=16,0
```

The above causes the compiler to use a distance of 16 iterations for memory to L2 prefetches. No L2 to L1 loop prefetches are issued by the compiler.

**See Also**

`qopt-prefetch`, `Qopt-prefetch` compiler option
**prefetch** pragma

**qopt-prefetch-issue-excl-hint, Qopt-prefetch-issue-excl-hint**

Supports the prefetchW instruction in Intel® microarchitecture code name Broadwell and later.

**Syntax**

Linux OS:

-qopt-prefetch-issue-excl-hint

macOS:

None

Windows OS:

/Qopt-prefetch-issue-excl-hint

**Arguments**

None

**Default**

OFF

The compiler does not support the PREFETCHW instruction for this microarchitecture.

**Description**

This option supports the PREFETCHW instruction in Intel® microarchitecture code name Broadwell and later. When you specify this option, you must also specify option [q or Q]opt-prefetch.

The prefetch instruction is merely a hint and does not affect program behavior. If executed, this instruction moves data closer to the processor and invalidates any other cached copy in anticipation of the line being written to in the future.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

qopt-prefetch/Qopt-prefetch compiler option

**qopt-ra-region-strategy, Qopt-ra-region-strategy**

Selects the method that the register allocator uses to partition each routine into regions.

**Syntax**

Linux OS and macOS:

-qopt-ra-region-strategy[=keyword]

Windows OS:

/Qopt-ra-region-strategy[=keyword]
Arguments

**keyword**

Is the method used for partitioning. Possible values are:

- **routine**
  - Creates a single region for each routine.
- **block**
  - Partitions each routine into one region per basic block.
- **trace**
  - Partitions each routine into one region per trace.
- **loop**
  - Partitions each routine into one region per loop.
- **default**
  - The compiler determines which method is used for partitioning.

Default

The compiler determines which method is used for partitioning. This is also the default if *keyword* is not specified.

Description

This option selects the method that the register allocator uses to partition each routine into regions.

When setting **default** is in effect, the compiler attempts to optimize the tradeoff between compile-time performance and generated code performance.

This option is only relevant when optimizations are enabled (option **O1** or higher).

IDE Equivalent

None

Alternate Options

None

See Also

- [compiler option qopt-streaming-stores, Qopt-streaming-stores](#)

  Enables generation of streaming stores for optimization.

Syntax

**Linux OS and macOS:**

- `-qopt-streaming-stores=keyword`

**Windows OS:**

- `/Qopt-streaming-stores:keyword`

Arguments

**keyword**

Specifies whether streaming stores are generated. Possible values are:
Enables generation of streaming stores for optimization. The compiler optimizes under the assumption that the application is memory bound.

When this option setting is specified, it is your responsibility to also insert any fences as required to ensure correct memory ordering within a thread or across threads. One typical way to do this is to insert a _mm_sfence() intrinsic call just after the loops (such as the initialization loop) where the compiler may insert streaming store instructions.

Disables generation of streaming stores for optimization. Normal stores are performed.

Lets the compiler decide which instructions to use.

**Default**

-qopt-streaming-stores=auto

**Description**

This option enables generation of streaming stores for optimization. This method stores data with instructions that use a non-temporal buffer, which minimizes memory hierarchy pollution.

This option may be useful for applications that can benefit from streaming stores.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

The following example shows a way to insert fences when specifying -qopt-streaming-stores=always or /Qopt-streaming-stores:always:

```cpp
void simple1(double * restrict a, double * restrict b, double * restrict c, double *d, int n)
{
    int i, j;

#pragma omp parallel for
    for (j=0; j<n; j++) {
        a[j] = 1.0;
        b[j] = 2.0;
        c[j] = 0.0;
    }
    _mm_sfence(); // OR _mm_mfence();

#pragma omp parallel for
    for (i=0; i<n; i++)
        a[i] = a[i] + c[i]*b[i];
}```
qopt-subscript-in-range, Qopt-subscript-in-range

Determines whether the compiler assumes that there are no "large" integers being used or being computed inside loops.

Syntax

Linux OS and macOS:

-qopt-subscript-in-range
-qno-opt-subscript-in-range

Windows OS:

/Qopt-subscript-in-range
/Qopt-subscript-in-range-

Arguments

None

Default

-qno-opt-subscript-in-range
or
/Qopt-subscript-in-range-

The compiler assumes there are "large" integers being used or being computed within loops.

Description

This option determines whether the compiler assumes that there are no "large" integers being used or being computed inside loops.

If you specify [q or Q]opt-subscript-in-range, the compiler assumes that there are no "large" integers being used or being computed inside loops. A "large" integer is typically > $2^{31}$.

This feature can enable more loop transformations.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how these options can be useful. Variable m is declared as type long (64-bits) and all other variables inside the subscript are declared as type int (32-bits):

$$A[ i + j + ( n + k) * m ]$$
qopt-threads-per-core, Qopt-threads-per-core

Informs the compiler about the number of hardware threads per core that will be used for an application. This option only applies when targeting Intel® Xeon Phi™ products.

Architecture Restrictions

Only available when targeting Intel® Xeon Phi™ products

Syntax

Linux OS:
-qopt-threads-per-core=n

macOS:
None

Windows OS:
/Qopt-threads-per-core:n

Arguments

n

Is the number of hardware threads per core that the compiler should assume that will be used while executing the application. Possible values are 1, 2, 3, or 4.

Default

4

Four hardware threads per core are used for the application.

Description

This option informs the compiler about the number of hardware threads per core that will be used for an application. This enables the compiler to perform better code optimizations (such as instruction scheduling).

You should choose a value for n that is based on how many threads will be used per core while executing the application. For example, if the application is parallelized using OpenMP* API, use the value of n that uses the same number of threads per core as the OpenMP* API affinity setting will use when executing the application code on the Intel® Xeon Phi™ processor.

This option does not affect the number of threads per core that will be used at run time.

Code compiled with this option can run correctly on any (hardware-supported) number of threads per core.

IDE Equivalent

None

Alternate Options

None

OpenMP* Affinity Specifications

qopt-zmm-usage, Qopt-zmm-usage

Defines a level of zmm registers usage.
Syntax

Linux OS and macOS:
-qopt-zmm-usage=keyword

Windows OS:
/Qopt-zmm-usage:keyword

Arguments

keyword

Specifies the level of zmm registers usage. Possible values are:

low
Tells the compiler that the compiled program is unlikely to benefit from zmm registers usage. It specifies that the compiler should avoid using zmm registers unless it can prove the gain from their usage.

high
Tells the compiler to generate zmm code without restrictions.

Default

varies

The default is low when you specify [Q]xCORE-AVX512. The default is high when you specify [Q]xCOMMON-AVX512.

Description

This option may provide better code optimization for Intel® processors that are on the Intel® microarchitecture formerly code-named Skylake.

This option defines a level of zmm registers usage. The low setting causes the compiler to generate code with zmm registers very carefully, only when the gain from their usage is proven. The high setting causes the compiler to use much less restrictive heuristics for zmm code generation.

It is not always easy to predict whether the high or the low setting will yield better performance. Programs that enjoy high performance gains from the use of xmm or ymm registers may expect performance improvement by moving to use zmm registers. However, some programs that use zmm registers may not gain as much or may even lose performance. We recommend that you try both option values to measure the performance of your programs.

This option is ignored if you do not specify an option that enables Intel® AVX-512, such as [Q]xCORE-AVX512 or option [Q]xCOMMON-AVX512, or if you specify an option that specifically targets the Intel® MIC Architecture such as [Q]xMIC-AVX512.

This option has no effect on loops that use pragma omp simd simdlen(n) or on functions that are generated by vector specifications specific to CORE-AVX512.

IDE Equivalent

None

Alternate Options

None

See Also

x, Qx compiler option
For more information about simd loops specification and vector function specification, see pragmas omp simd and omp declare simd in the OpenMP* TR4: Version 5.0 specification.

**qoverride-limits, Qoverride-limits**

Lets you override certain internal compiler limits that are intended to prevent excessive memory usage or compile times for very large, complex compilation units.

### Syntax

**Linux OS and macOS:**

-qoverride-limits

**Windows OS:**

/Qoverride-limits

### Arguments

None

### Default

OFF Certain internal compiler limits are not overridden. These limits are determined by default heuristics.

### Description

This option provides a way to override certain internal compiler limits that are intended to prevent excessive memory usage or compile times for very large, complex compilation units.

If this option is not used and your program exceeds one of these internal compiler limits, some optimizations will be skipped to reduce the memory footprint and compile time. If you chose to create an optimization report by specifying [q or Q]opt-report, you may see a related diagnostic remark as part of the report.

Specifying this option may substantially increase compile time and/or memory usage.

**NOTE**

If you use this option, it is your responsibility to ensure that sufficient memory is available. If there is not sufficient available memory, the compilation may fail.

This option should only be used where there is a specific need; it is not recommended for inexperienced users.

### IDE Equivalent

None

### Alternate Options

None

### Qvla

 Determines whether variable length arrays are enabled.
**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
/Qvla
/Qvla-

**Arguments**
None

**Default**
/Qvla- Variable length arrays are disabled.

**Description**
This option determines whether variable length arrays (a C99 feature) are enabled. To enable variable length arrays, you must specify /Qvla.

**IDE Equivalent**
None

**Alternate Options**
None

**scalar-rep, Qscalar-rep**
Enables or disables the scalar replacement optimization done by the compiler as part of loop transformations.

**Syntax**

**Linux OS and macOS:**
-scalar-rep
-no-scalar-rep

**Windows OS:**
/Qscalar-rep
/Qscalar-rep-

**Arguments**
None

**Default**
-scalar-rep or /Qscalar-rep Scalar replacement is performed during loop transformation at optimization levels of O2 and above.
Description
This option enables or disables the scalar replacement optimization done by the compiler as part of loop
transformations. This option takes effect only if you specify an optimization level of O2 or higher.

IDE Equivalent
None

Alternate Options
None

See Also
O compiler option

simd, Qsimd
Enables or disables compiler interpretation of simd pragmas.

Syntax
Linux OS and macOS:
-simd
-no-simd

Windows OS:
/Qsimd
/Qsimd-

Arguments
None

Default
-simd or/Qsimd
SIMD pragmas are enabled.

Description
This option enables or disables compiler interpretation of simd pragmas.

To disable interpretation of simd pragmas, specify -no-simd (Linux* and macOS*) or /Qsimd- (Windows*).
Note that the compiler may still vectorize loops based on its own heuristics (leading to generation of SIMD
instructions) even when -no-simd (or /Qsimd-) is specified.

To disable all compiler vectorization, use the "-no-vec -no-simd" (Linux* and macOS*) or
"/Qvec- /Qsimd-" (Windows*) compiler options. The option -no-vec (and /Qvec-) disables all auto-
vectorization, including vectorization of array notation statements. The option -no-simd (and /Qsimd-)
disables vectorization of loops that have simd pragmas.

NOTE
If you specify option -mia32 (Linux*) or option /arch:IA32 (Windows*), simd pragmas are
disabled by default and vector instructions cannot be used. Therefore, you cannot explicitly
enable SIMD pragmas by specifying option [Q]simd.
### IDE Equivalent
None

### Alternate Options
None

### See Also
- `vec`, `Qvec` compiler option
- Function Annotations and the SIMD Directive for Vectorization
- `simd pragma`

**simd-function-pointers, Qsimd-function-pointers**

Enables or disables pointers to simd-enabled functions.

### Syntax

**Linux OS and macOS:**
- `-simd-function-pointers`
- `-no-simd-function-pointers`

**Windows OS:**
- `/Qsimd-function-pointers`
- `/Qsimd-function-pointers-`

### Arguments
None

### Default
- `-no-simd-function-pointers` or `/Qsimd-function-pointers-`

Pointers to simd-enabled functions are disabled. Vector specifications can only be placed in function declarations and definitions.

### Description
This option enables or disables pointers to simd-enabled functions.

When option `[Q]simd-function-pointers` is specified, it defines simd-enabled (vector) function pointers by placing vector specifications with all usual clauses in function pointer declarations. The vector specifications must be indicated in an attribute vector declaration or in pragma `omp declare simd`.

These pointers can enable indirect calls to appropriate vector versions of the function from a simd loop or another simd-enabled function.

### IDE Equivalent
None

### Alternate Options
None
**tbb, Qtbb**

*Tells the compiler to link to the Intel® Threading Building Blocks (Intel® TBB) libraries.*

**Syntax**

**Linux OS and macOS:**

- `-tbb`

**Windows OS:**

- `/Qtbb`

**Arguments**

None

**Default**

OFF

*The compiler does not link to the Intel® TBB libraries.*

**Description**

This option tells the compiler to link to the Intel® Threading Building Blocks (Intel® TBB) libraries and include the Intel® TBB headers.

---

**NOTE**

On Windows* systems, this option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker. On Linux* and macOS* systems, this option is processed by the icc/icpc command that initiates linking, adding library names explicitly to the link command.

---

**IDE Equivalent**

Visual Studio: None

Eclipse: *Performance Library Build Components > Use Intel(R) Threading Building Blocks Library*

Xcode: *Performance Library Build Components > Use Intel(R) Threading Building Blocks Library*

**Alternate Options**

None

**unroll, Qunroll**

*Tells the compiler the maximum number of times to unroll loops.*

**Syntax**

**Linux OS and macOS:**

- `-unroll[=n]`

**Windows OS:**

- `/Qunroll[:n]`
Arguments

\( n \)

Is the maximum number of times a loop can be unrolled. To disable loop unrolling, specify 0.

Default

-\texttt{unroll}

or \texttt{Qunroll}

The compiler uses default heuristics when unrolling loops.

Description

This option tells the compiler the maximum number of times to unroll loops. If you do not specify \( n \), the optimizer determines how many times loops can be unrolled.

IDE Equivalent

Visual Studio: \texttt{Optimization > Loop Unrolling}

Eclipse: \texttt{Optimization > Loop Unroll Count}

Xcode: \texttt{Optimization > Loop Unrolling}

Alternate Options

Linux and macOS*: \texttt{-funroll-loops}

Windows: None

\texttt{unroll-aggressive, Qunroll-aggressive}

\textit{Determines whether the compiler uses more aggressive unrolling for certain loops.}

Syntax

Linux OS and macOS:

-\texttt{-unroll-aggressive}

-\texttt{-no-unroll-aggressive}

Windows OS:

-\texttt{/Qunroll-aggressive}

-\texttt{/Qunroll-aggressive-}

Arguments

None

Default

-\texttt{-no-unroll-aggressive}

or \texttt{/Qunroll-aggressive-}

The compiler uses default heuristics when unrolling loops.

Description

This option determines whether the compiler uses more aggressive unrolling for certain loops. The positive form of the option may improve performance.

This option enables aggressive, complete unrolling for loops with small constant trip counts.
IDE Equivalent
None

Alternate Options
None

**use-intel-optimized-headers, Quse-intel-optimized-headers**
Determines whether the performance headers directory is added to the include path search list.

**Syntax**

**Linux OS and macOS:**
-use-intel-optimized-headers

**Windows OS:**
/Quse-intel-optimized-headers

**Arguments**
None

**Default**
-no-use-intel-optimized-headers  
or  
/Quse-intel-optimized-headers-

**Description**

This option determines whether the performance headers directory is added to the include path search list. The performance headers directory is added if you specify [Q]use-intel-optimized-headers. Appropriate libraries are also linked in, as needed, for proper functionality.

Using Intel's valarray Implementation

**vec, Qvec**

*Enables or disables vectorization.*

**Syntax**

Linux OS and macOS:

- `vec`
- `no-vec`

Windows OS:

- `/Qvec`
- `/Qvec-`

**Arguments**

None

**Default**

- `vec` or `/Qvec`

Or `vec`, `/Qvec`

Vectorization is enabled if option `O2` or higher is in effect.

**Description**

This option enables or disables vectorization.

To disable vectorization, specify `-no-vec` (Linux* and macOS*) or `/Qvec-` (Windows*).

To disable interpretation of SIMD pragmas, specify `-no-simd` (Linux* and macOS*) or `/Qsimd-` (Windows*).

To disable all compiler vectorization, use the "-no-vec -no-simd" (Linux* and macOS*) or "/Qvec- /Qsimd-" (Windows*) compiler options. The option `-no-vec` (and `/Qvec-`) disables all auto-vectorization, including vectorization of array notation statements. The option `-no-simd` (and `/Qsimd-`) disables vectorization of loops that have SIMD pragmas.

**NOTE**

Using this option enables vectorization at default optimization levels for both Intel® microprocessors and non-Intel microprocessors. Vectorization may call library routines that can result in additional performance gain on Intel microprocessors than on non-Intel microprocessors. The vectorization can also be affected by certain options, such as `/arch` (Windows), `-m` (Linux and macOS*), or `[Q]x`.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

- `simd, Qsimd` compiler option
- `ax, Qax` compiler option
x, Qx compiler option

-vec-guard-write, Qvec-guard-write compiler option

-vec-threshold, Qvec-threshold compiler option

**vec-guard-write, Qvec-guard-write**

*Tells the compiler to perform a conditional check in a vectorized loop.*

**Syntax**

**Linux OS and macOS:**

-vec-guard-write

-no-vec-guard-write

**Windows OS:**

/Qvec-guard-write

/Qvec-guard-write-

**Arguments**

None

**Default**

-vec-guard-write

or /Qvec-guard-write

**Description**

This option tells the compiler to perform a conditional check in a vectorized loop. This checking avoids unnecessary stores and may improve performance.

**IDE Equivalent**

None

**Alternate Options**

None

**vec-threshold, Qvec-threshold**

*Sets a threshold for the vectorization of loops.*

**Syntax**

**Linux OS and macOS:**

-vec-threshold[\(n\)]

**Windows OS:**

/Qvec-threshold[[:]]n

**Arguments**

\(n\)  

Is an integer whose value is the threshold for the vectorization of loops. Possible values are 0 through 100.
If \( n \) is 0, loops get vectorized always, regardless of computation work volume.

If \( n \) is 100, loops get vectorized when performance gains are predicted based on the compiler analysis data. Loops get vectorized only if profitable vector-level parallel execution is almost certain.

The intermediate 1 to 99 values represent the percentage probability for profitable speed-up. For example, \( n=50 \) directs the compiler to vectorize only if there is a 50% probability of the code speeding up if executed in vector form.

**Default**

-vec-threshold100 or /Qvec-threshold100

Loops get vectorized only if profitable vector-level parallel execution is almost certain. This is also the default if you do not specify \( n \).

**Description**

This option sets a threshold for the vectorization of loops based on the probability of profitable execution of the vectorized loop in parallel.

This option is useful for loops whose computation work volume cannot be determined at compile-time. The threshold is usually relevant when the loop trip count is unknown at compile-time.

The compiler applies a heuristic that tries to balance the overhead of creating multiple threads versus the amount of work available to be shared amongst the threads.

**IDE Equivalent**

Visual Studio: Optimization > Threshold For Vectorization

Eclipse: Optimization > Enable Maximum Vector-level Parallelism

Xcode: Optimization > Enable Maximum Vector-level Parallelism

**Alternate Options**

None

**vecabi, Qvecabi**

_Determines which vector function application binary interface (ABI) the compiler uses to create or call vector functions._

**Syntax**

Linux OS and macOS:

-vecabi=keyword

Windows OS:

/Qvecabi:keyword

**Arguments**

*keyword*  
Specifies which vector function ABI to use. Possible values are:
compat

Tells the compiler to use the compatibility vector function ABI. This ABI includes Intel®-specific features.

cmddtarget

Tells the compiler to generate an extended set of vector functions. The option is very similar to setting compat. However, for compat, only one vector function is created, while for cmddtarget, several vector functions are created for each vector specification. Vector variants are created for targets specified by compiler options [Q]x and/or [Q]ax. No change is made to the source code.

gcc

Tells the compiler to use the gcc vector function ABI. Use this setting only in cases when you want to link with modules compiled by gcc. This setting is not available on Windows* systems.

legacy

Tells the compiler to use the legacy vector function ABI. Use this setting if you need to keep the generated vector function binary backward compatible with the vectorized binary generated by older versions of the Intel® compilers (V13.1 or older).

Default

compat

The compiler uses the compatibility vector function ABI.

Description

This option determines which vector function application binary interface (ABI) the compiler uses to create or call vector functions.

NOTE

To avoid possible link-time and run-time errors, use identical [Q]vecabi settings when compiling all files in an application that define or use vector functions, including libraries. If setting cmddtarget is specified, options [Q]x and/or [Q]ax must have identical values.

Be careful using setting cmddtarget with libraries or program modules/routines with vector function definitions that cannot be recompiled. In such cases, setting cmddtarget may cause link errors.

On Linux* systems, since the default is compat, you must specify legacy if you need to keep the generated vector function binary backward compatible with the vectorized binary generated by the previous version of Intel® compilers.

When cmddtarget is specified, the additional vector function versions are created by copying each vector specification and changing target processor in the copy. The number of vector functions is determined by the settings specified in options [Q]x and/or [Q]ax.

For example, suppose we have the following function declaration:

```c
__declspec (vector(processor(core_2_duo_sse4_1))) int foo(int a);
```

and the following options are specified: `-axAVX,CORE-AVX2`
The following table shows the different results for the above declaration and option specifications when setting `compat` or setting `cmdtarget` is used:

<table>
<thead>
<tr>
<th>compat</th>
<th>cmdtarget</th>
</tr>
</thead>
<tbody>
<tr>
<td>One vector version is created for Intel® SSE4.1 (by vector function specification).</td>
<td>Four vector versions are created for the following targets:</td>
</tr>
</tbody>
</table>

• Intel® SSE2 (default because no `-x` option is used)
• Intel® SSE4.1 (by vector function specification)
• Intel® AVX (by the first `-ax` option value)
• Intel® AVX2 (by the second `-ax` option value)

For more information about the Intel®-compatible vector functions ABI, see the article titled: Vector (SIMD) Function ABI, which is located in https://software.intel.com/en-us/articles/vector-simd-function-abi/

For more information about the GCC vector functions ABI, see the item Libmvec - vector math library document in the GLIBC wiki at sourceware.org.

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Notice revision #20110804

**IDE Equivalent**

None

**Alternate Options**

None

**Profile Guided Optimization (PGO) Options**

`finstrument-functions`, `Qinstrument-functions`

*Determines whether function entry and exit points are instrumented.*

**Syntax**

**Linux OS and macOS:**

- `finstrument-functions`
- `fno-instrument-functions`

**Windows OS:**

/`Qinstrument-functions`
/`Qinstrument-functions-`
Arguments
None

Default
-fno-instrument-functions Function entry and exit points are not instrumented.
or/Qinstrument-functions-

Description
This option determines whether function entry and exit points are instrumented. It may increase execution time.

The following profiling functions are called with the address of the current function and the address of where
the function was called (its "call site"):

- This function is called upon function entry:
  ```c
  void __cyg_profile_func_enter (void *this_fn,
                                  void *call_site);
  ```

- This function is called upon function exit:
  ```c
  void __cyg_profile_func_exit (void *this_fn,
                                 void *call_site);
  ```

These functions can be used to gather more information, such as profiling information or timing information.
Note that it is the user's responsibility to provide these profiling functions.

If you specify -finstrument-functions (Linux* and macOS*) or /Qinstrument-functions (Windows*),
function inlining is disabled. If you specify -fno-instrument-functions or /Qinstrument-functions-,
inlining is not disabled.

On Linux and macOS* systems, you can use the following attribute to stop an individual function from being
instrumented:

```c
__attribute__((__no_instrument_function__))
```

It also stops inlining from being disabled for that individual function.

This option is provided for compatibility with gcc.

IDE Equivalent

Alternate Options
None

fnsplit, Qfnsplit

Enables function splitting.

Syntax

Linux OS:
-fnsplit=[-n]
-no-fnsplit

macOS:
None
Windows OS:
/Qfnsplit[:n]
/Qfnsplit-

Arguments

n
Is an optional positive integer indicating the threshold number.
The blocks can be placed into a different code segment if they are only reachable via a conditional branch whose taken probability is less than the specified n. Branch taken probability is heuristically calculated by the compiler and can be observed in assembly listings.
The range for n is 0 <= n <= 100.

Default
OFF

Function splitting is not enabled. However, function grouping is still enabled.

Description
This option enables function splitting. If you specify [Q]fnsplit with no n, you must also specify option [Q]prof-use, or the option will have no effect and no function splitting will occur.
If you specify n, function splitting is enabled and you do not need to specify option [Q]prof-use.
To disable function splitting when you use option [Q]prof-use, specify /Qfnsplit- (Windows*) or -no-fnsplit (Linux*).

NOTE
Function splitting is generally not supported when exception handling is turned on for C/C++ routines in the stack of called routines. See also -fexceptions (Linux*) and the C/C++ option /EH (Windows*).

**Gh**: compiler option

**p**

*Compiles and links for function profiling with gprof(1).*

**Syntax**

**Linux OS and macOS:**

```bash
-p
```

**Windows OS:**

None

**Arguments**

None

**Default**

OFF  

Files are compiled and linked without profiling.

**Description**

This option compiles and links for function profiling with gprof(1).

When you specify this option, inlining is disabled. However, you can override this by specifying pragma forceinline,declspec forceinline (Windows*), attribute always_inline (Linux* and macOS*), or a compiler option such as `inline-forceinline`.

**IDE Equivalent**

None

**Alternate Options**

**Linux and macOS***: `-QP` (this is a deprecated option)

Windows: None

**prof-data-order, Qprof-data-order**

*Enables or disables data ordering if profiling information is enabled.*

**Syntax**

**Linux OS:**

```bash
-prof-data-order
-no-prof-data-order
```

**macOS:**

None

**Windows OS:**

```bash
/Qprof-data-order
/Qprof-data-order-
```
Arguments
None

Default
-no-prof-data-order or /Qprof-data-order-

Data ordering is disabled.

Description
This option enables or disables data ordering if profiling information is enabled. It controls the use of profiling information to order static program data items.

For this option to be effective, you must do the following:

• For instrumentation compilation, you must specify option [Q]prof-gen setting globdata.
• For feedback compilation, you must specify the [Q]prof-use option. You must not use multi-file optimization by specifying options such as [Q]ipo or [Q]ipo-c.

IDE Equivalent
None

Alternate Options
None

compiler option
prof-func-order, Qprof-func-order
compiler option

prof-dir, Qprof-dir
Specifies a directory for profiling information output files.

Syntax

Linux OS and macOS:

-prof-dir dir

Windows OS:

/Qprof-dir:dir

Arguments
dir

Is the name of the directory. You can specify a relative pathname or an absolute pathname.

Default
OFF

Profiling output files are placed in the directory where the program is compiled.
Description
This option specifies a directory for profiling information output files (*.dyn and *.dpi). The specified directory must already exist.

You should specify this option using the same directory name for both instrumentation and feedback compilations. If you move the .dyn files, you need to specify the new path.

Option /Qprof-dir is equivalent to option /Qcov-dir. If you specify both options, the last option specified on the command line takes precedence.

IDE Equivalent
Visual Studio: General > Profile Directory
Eclipse: Optimization > Profile Directory
Xcode: None

Alternate Options
None

prof-file, Qprof-file
Specifies an alternate file name for the profiling summary files.

Syntax
Linux OS and macOS:
prof-file filename

Windows OS:
/Qprof-file:filename

Arguments
filename
Is the name of the profiling summary file.

Default
OFF
The profiling summary files have the file name pgopti.*

Description
This option specifies an alternate file name for the profiling summary files. The filename is used as the base name for files created by different profiling passes.

If you add this option to profmerge, the .dpi file will be named filename.dpi instead of pgopti.dpi.

If you specify this option with option [Q]prof-use, the .dpi file will be named filename.dpi instead of pgopti.dpi.

Option /Qprof-file is equivalent to option /Qcov-file. If you specify both options, the last option specified on the command line takes precedence.

NOTE
When you use option [Q]prof-file, you can only specify a file name. If you want to specify a path (relative or absolute) for filename, you must also use option [Q]prof-dir.
IDE Equivalent
None

Alternate Options
None

See Also
prof-gen, Qprof-gen compiler option

**prof-func-groups**
*Enables or disables function grouping if profiling information is enabled.*

**Syntax**

*Linux OS:*
- -prof-func-groups
- -no-prof-func-groups

*macOS:*
None

*Windows OS:*
None

**Arguments**
None

**Default**
- -no-prof-func-groups  Function grouping is disabled.

**Description**
This option enables or disables function grouping if profiling information is enabled.

A "function grouping" is a profiling optimization in which entire routines are placed either in the cold code section or the hot code section.

If profiling information is enabled by option -prof-use, option -prof-func-groups is set and function grouping is enabled. However, if you explicitly enable -prof-func-order, function ordering is performed instead of function grouping.

If you want to disable function grouping when profiling information is enabled, specify -no-prof-func-groups.

To set the hotness threshold for function grouping, use option -prof-hotness-threshold.

**IDE Equivalent**
None

**See Also**
prof-use, Qprof-use compiler option
prof-func-order, Qprof-func-order
compiler option

prof-hotness-threshold, Qprof-hotness-threshold
compiler option

**prof-func-order, Qprof-func-order**

*Enables or disables function ordering if profiling information is enabled.*

**Syntax**

**Linux OS:**

- `-prof-func-order`
- `-no-prof-func-order`

**macOS:**

None

**Windows OS:**

`/Qprof-func-order`
`/Qprof-func-order-`

**Arguments**

None

**Default**

- `-no-prof-func-order` Function ordering is disabled.
- `/Qprof-func-order-`

**Description**

This option enables or disables function ordering if profiling information is enabled.

For this option to be effective, you must do the following:

- For instrumentation compilation, you must specify option `[/Q]prof-gen setting srcpos`.
- For feedback compilation, you must specify `[/Q]prof-use`. You must not use multi-file optimization by specifying options such as `[/Q]ipo` or `[/Q]ipo-c`.

If you enable profiling information by specifying option `[/Q]prof-use`, option `[/Q]prof-func-groups` is set and function grouping is enabled. However, if you explicitly enable the `[/Q]prof-func-order` option, function ordering is performed instead of function grouping.

On Linux* systems, this option is only available for Linux linker 2.15.94.0.1, or later.

To set the hotness threshold for function grouping and function ordering, use option `[/Q]prof-hotness-threshold`.

**IDE Equivalent**

None

**Alternate Options**

None
Example

The following example shows how to use this option on a Windows system:

```
icl /Qprof-gen:globdata file1.c file2.c /Fe instrumented.exe
icl /Qprof-use /Qprof-func-order file1.c file2.c /Fe feedback.exe
```

The following example shows how to use this option on a Linux system:

```
icc -prof-gen:globdata file1.c file2.c -o instrumented
   ./instrumented.exe
icc -prof-use -prof-func-order file1.c file2.c -o feedback
```

**prof-gen, Qprof-gen**

*Produces an instrumented object file that can be used in profile guided optimization.*

Syntax

**Linux OS and macOS:**

```
-prof-gen[=keyword[, keyword], ...]
-no-prof-gen
```

**Windows OS:**

```
/Qprof-gen[=keyword[,keyword],...]
/Qprof-gen-
```

Arguments

`keyword`

Specifies details for the instrumented file. Possible values are:

- **default**
  - Produces an instrumented object file. This is the same as specifying the [Q]prof-gen option with no keyword.

- **srcpos**
  - Produces an instrumented object file that includes extra source position information.

- **globdata**
  - Produces an instrumented object file that includes information for global data layout.
[no]threads\textsafe Produce an instrumented object file that includes the collection of PGO data on applications that use a high level of parallelism. If [Q]prof-gen is specified with no keyword, the default is nothreadsafe.

**Default**

-no-prof-gen or /Qprof-gen- Profile generation is disabled.

**Description**

This option produces an instrumented object file that can be used in profile guided optimization. It gets the execution count of each basic block.

You can specify more than one setting for [Q]prof-gen. For example, you can specify the following:

- \texttt{-prof-gen=}scrpos \texttt{-prof-gen=}threadsafe (Linux* and macOS*)
- \texttt{-prof-gen=}scrpos, threadsafe (this is equivalent to the above)

\texttt{/Qprof-gen=}scrpos \texttt{/Qprof-gen=}threadsafe (Windows*)

\texttt{/Qprof-gen=}scrpos, threadsafe (this is equivalent to the above)

If you specify keyword srcpos or globdata, a static profile information file (.spi) is created. These settings may increase the time needed to do a parallel build using -prof-gen, because of contention writing the .spi file.

These options are used in phase 1 of the Profile Guided Optimizer (PGO) to instruct the compiler to produce instrumented code in your object files in preparation for instrumented execution.

When the [Q]prof-gen option is used to produce an instrumented binary file for profile generation, some optimizations are disabled. Those optimizations are not disabled for any subsequent profile-guided compilation with option [Q]prof-use that makes use of the generated profiles.

**IDE Equivalent**

Visual Studio: **General > Profile Guided Optimization**

**General > Code Coverage Build Options**

Eclipse: **Optimization > Profile Guided Optimization**

Xcode: None

**Alternate Options**

None

**See Also**

prof-use, Qprof-use

compiler option

Profile an Application with Instrumentation

**prof-gen-sampling**

Tells the compiler to generate debug discriminators in debug output. This aids in developing more precise sampled profiling output.

**Syntax**

Linux OS:

- \texttt{-prof-gen=}sampling
macOS:
None

Windows OS:
None

Arguments
None

Default
OFF

The compiler does not generate debug discriminators in the debug output.

Description
This option tells the compiler to generate debug discriminators in debug output. Debug discriminators are used to distinguish code from different basic blocks that have the same source position information. This aids in developing more precise sampled hardware profiling output.

To build an executable suitable for generating hardware profiled sampled output, compile with the following options:

-.prof-gen-sampling -g

To use the data files produced by hardware profiling, compile with option -prof-use-sampling.

IDE Equivalent
None

Alternate Options
None

See Also
prof-use-sampling

g compiler option
Profile an Application with Instrumentation

prof-hotness-threshold, Qprof-hotness-threshold
Lets you set the hotness threshold for function grouping and function ordering.

Syntax

Linux OS:
-prof-hotness-threshold=n

macOS:
None

Windows OS:
/Qprof-hotness-threshold:n
Arguments

\( n \)

Is the hotness threshold. \( n \) is a percentage having a value between 0 and 100 inclusive. If you specify 0, there will be no hotness threshold setting in effect for function grouping and function ordering.

Default

OFF

The compiler's default hotness threshold setting of 10 percent is in effect for function grouping and function ordering.

Description

This option lets you set the hotness threshold for function grouping and function ordering.

The "hotness threshold" is the percentage of functions in the application that should be placed in the application's hot region. The hot region is the most frequently executed part of the application. By grouping these functions together into one hot region, they have a greater probability of remaining resident in the instruction cache. This can enhance the application's performance.

For this option to take effect, you must specify option [Q]prof-use and one of the following:

- On Linux systems: -prof-func-groups or -prof-func-order
- On Windows systems: /Qprof-func-order

IDE Equivalent

None

Alternate Options

None

prof-src-dir, Qprof-src-dir

Determines whether directory information of the source file under compilation is considered when looking up profile data records.

Syntax

Linux OS and macOS:

- prof-src-dir
- no-prof-src-dir

Windows OS:

/Qprof-src-dir
/Qprof-src-dir-
Arguments
None

Default

[Q]prof-src-dir
Directory information is used when looking up profile data records in the .dpi file.

Description
This option determines whether directory information of the source file under compilation is considered when looking up profile data records in the .dpi file. To use this option, you must also specify the [Q]prof-use option.

If the option is enabled, directory information is considered when looking up the profile data records within the .dpi file. You can specify directory information by using one of the following options:

- Linux and macOS*: -prof-src-root or -prof-src-root-cwd
- Windows: /Qprof-src-root or /Qprof-src-root-cwd

If the option is disabled, directory information is ignored and only the name of the file is used to find the profile data record.

Note that option [Q]prof-src-dir controls how the names of the user’s source files get represented within the .dyn or .dpi files. Option [Q]prof-dir specifies the location of the .dyn or the .dpi files.

IDE Equivalent
None

Alternate Options
None

See Also
prof-use, Qprof-use
compiler option
prof-src-root, Qprof-src-root
compiler option
prof-src-root-cwd, Qprof-src-root-cwd
compiler option

prof-src-root, Qprof-src-root
Lets you use relative directory paths when looking up profile data and specifies a directory as the base.

Syntax

Linux OS and macOS:
- prof-src-root=dir

Windows OS:
/Qprof-src-root:dir

Arguments

dir
Is the base for the relative paths.
Default
OFF

The setting of relevant options determines the path used when looking up profile data records.

Description
This option lets you use relative directory paths when looking up profile data in .dpi files. It lets you specify a directory as the base. The paths are relative to a base directory specified during the [Q]prof-gen compilation phase.

This option is available during the following phases of compilation:

- Linux* and macOS* systems: -prof-gen and -prof-use phases
- Windows* systems: /Qprof-gen and /Qprof-use phases

When this option is specified during the [Q]prof-gen phase, it stores information into the .dyn or .dpi file. Then, when .dyn files are merged together or the .dpi file is loaded, only the directory information below the root directory is used for forming the lookup key.

When this option is specified during the [Q]prof-use phase, it specifies a root directory that replaces the root directory specified at the [Q]prof-gen phase for forming the lookup keys.

To be effective, this option or option [Q]prof-src-root-cwd must be specified during the [Q]prof-gen phase. In addition, if one of these options is not specified, absolute paths are used in the .dpi file.

IDE Equivalent
None

Alternate Options
None

Example
Consider the initial [Q]prof-gen compilation of the source file c:\user1\feature_foo\myproject\common\glob.c shown below:

Windows*: icl /Qprof-gen /Qprof-src-root=c:\user1\feature_foo\myproject -c common\glob.c
Linux* and macOS*: icc -prof-gen -prof-src-root=c:\user1\feature_foo\myproject -c common\glob.c

For the [Q]prof-use phase, the file glob.c could be moved into the directory c:\user2\feature_bar\myproject\common\glob.c and profile information would be found from the .dpi when using the following:

Windows*: icl /Qprof-use /Qprof-src-root=c:\user2\feature_bar\myproject -c common\glob.c
Linux* and macOS*: icc -prof-use -prof-src-root=c:\user2\feature_bar\myproject -c common\glob.c

If you do not use option [Q]prof-src-root during the [Q]prof-gen phase, by default, the [Q]prof-use compilation can only find the profile data if the file is compiled in the c:\user1\feature_foo\my_project\common directory.

OFF

**Description**

This option lets you use relative directory paths when looking up profile data in .dpi files. It specifies the current working directory as the base. To use this option, you must also specify option `prof-use`.

This option is available during the following phases of compilation:

- Linux* and macOS* systems: `-prof-gen` and `-prof-use` phases
- Windows* systems: `/Qprof-gen` and `/Qprof-use` phases

When this option is specified during the `[Q]prof-gen` phase, it stores information into the .dyn or .dpi file. Then, when .dyn files are merged together or the .dpi file is loaded, only the directory information below the root directory is used for forming the lookup key.

When this option is specified during the `[Q]prof-use` phase, it specifies a root directory that replaces the root directory specified at the `[Q]prof-gen` phase for forming the lookup keys.

To be effective, this option or option `[Q]prof-src-root` must be specified during the `[Q]prof-gen` phase. In addition, if one of these options is not specified, absolute paths are used in the .dpi file.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

`prof-gen, Qprof-gen` compiler option

`prof-use, Qprof-use` compiler option

`prof-src-dir, Qprof-src-dir` compiler option

`prof-src-root, Qprof-src-root`
**prof-use, Qprof-use**

Enables the use of profiling information during optimization.

### Syntax

**Linux OS and macOS:**

- `-prof-use[=keyword]`
- `-no-prof-use`

**Windows OS:**

- `/Qprof-use[:keyword]`
- `/Qprof-use-`

### Arguments

`keyword` specifies additional instructions. Possible values are:

- `weighted`
  
  Tells the profmerge utility to apply a weighting to the `.dyn` file values when creating the `.dpi` file to normalize the data counts when the training runs have different execution durations. This argument only has an effect when the compiler invokes the profmerge utility to create the `.dpi` file. This argument does not have an effect if the `.dpi` file was previously created without weighting.

- `[no]merge`
  
  Enables or disables automatic invocation of the profmerge utility. The default is `merge`. Note that you cannot specify both `weighted` and `nomerge`. If you try to specify both values, a warning will be displayed and `nomerge` takes precedence.

- `default`
  
  Enables the use of profiling information during optimization. The profmerge utility is invoked by default. This value is the same as specifying `[Q]prof-use` with no argument.

### Default

- `-no-prof-use` or `/Qprof-use-`

  Profiling information is not used during optimization.

### Description

This option enables the use of profiling information (including function splitting and function grouping) during optimization. It enables option `/Qfnsplit` (Windows*) and `-fnsplit` (Linux* and macOS*).

This option instructs the compiler to produce a profile-optimized executable and it merges available profiling output files into a pgopti.dpi file.

Note that there is no way to turn off function grouping if you enable it using this option.

To set the hotness threshold for function grouping and function ordering, use option `[Q]prof-hotness-threshold.`
IDE Equivalent

Visual Studio: General > Profile Guided Optimization
Eclipse: Optimization > Profile Guided Optimization
Xcode: None

Alternate Options

Profile an Application with Instrumentation

prof-use-sampling

Short Description

This option lets you use data files produced by hardware profiling to produce an optimized executable. These data files are named and produced by using Intel® VTune™.

The executable should have been produced using the following options:

- prof-gen-sampling -g

IDE Equivalent

None

Alternate Options

None

Syntax

Linux OS:

-prof-use-sampling=list

macOS:

None

Windows OS:

None

Arguments

list

Is a list of one or more data files. If you specify more than one data file, they must be separated by colons.

Default

OFF

Data files produced by hardware profiling will not be used to produce an optimized executable.

Description

This option lets you use data files produced by hardware profiling to produce an optimized executable. These data files are named and produced by using Intel® VTune™.

The executable should have been produced using the following options:
See Also
prof-gen-sampling
compiler option
Profile an Application with Instrumentation

prof-value-profiling, Qprof-value-profiling
Controls which values are value profiled.

Syntax
Linux OS and macOS:
-prof-value-profiling[=keyword]

Windows OS:
/Qprof-value-profiling[=keyword]

Arguments
keyword

Controls which type of value profiling is performed. Possible values are:

none
Prevents all types of value profiling.
nodivide
Prevents value profiling of non-compile time constants used in division or remainder operations.
noindcall
Prevents value profiling of function addresses at indirect call sites.
all
Enables all types of value profiling.

You can specify more than one keyword, but they must be separated by commas.

Default
all
All value profile types are enabled and value profiling is performed.

Description
This option controls which features are value profiled.
If this option is specified with option [Q]prof-gen, it turns off instrumentation of operations of the specified type. This also prevents feedback of values for the operations.
If this option is specified with option [Q]prof-use, it turns off feedback of values collected of the specified type.
If you specify level 2 or higher for option[q or Q]opt-report, the value profiling specialization information will be reported within the PGO optimization report.

IDE Equivalent
None

Alternate Options
None

profile-functions, Qprofile-functions

*Inserts instrumentation calls at a function’s entry and exit points.*

**Syntax**

**Linux OS and macOS:**
- `profile-functions`

**Windows OS:**
- `/Qprofile-functions`

**Arguments**

None

**Default**

OFF  
No instrumentation calls are inserted at a function’s entry and exit points.

**Description**

This option inserts instrumentation calls at a function’s entry and exit points within a single-threaded application to collect the cycles spent within the function to produce reports that can help in identifying code hotspots.

When the instrumented application is run, this option causes the generation of a loop_prof_funcs_<name>.dump file, where <name> is a timestamp for the run.

The same data values are also dumped into the file loop_prof_.<name>.xml for use with the data viewer application, unless you turn off the output format by setting the environment variable INTEL_LOOP_PROF_XML_DUMP to 0.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

profile-loops, Qprofile-loops compiler option

profile-loops-report, Qprofile-loops-report compiler option

profile-loops, Qprofile-loops

*Inserts instrumentation calls at a function’s entry and exit points, and before and after instrumentable loops.*

**Syntax**

**Linux OS and macOS:**
- `-profile-loops=keyword`

**Windows OS:**
- `/Qprofile-loops:keyword`
Arguments

`keyword` Specifies which type of loops should have instrumentation. Possible values are:

- `inner` Inserts instrumentation before and after inner loops.
- `outer` Inserts instrumentation before and after outer loops.
- `all` Inserts instrumentation before and after all loops.

Default

`OFF` No instrumentation calls are inserted at a function’s entry and exit points, or before and after instrumentable loop.

Description

This option inserts instrumentation calls at a function’s entry and exit points within a single-threaded application. For unthreaded applications, it also inserts instrumentation before and after instrumentable loops of the type listed in `keyword`.

When the instrumented application is run, this option causes the generation of a `loop_prof_funcs_<name>.dump` file and a `loop_prof_funcs_<name>.dump` file, where `<name>` is a timestamp for the run.

The same timestamp is used for the loop file and function file. This identifies that the loop data and function data were from the same program run.

The same data values are also dumped into the file `loop_prof_<name>.xml` for use with the data viewer application, unless you turn off the output format by setting the environment variable `INTEL_LOOP_PROF_XML_DUMP` to 0.

IDE Equivalent

None

Alternate Options

None

See Also

`profile-functions`, `Qprofile-functions` compiler option
`profile-loops-report`, `Qprofile-loops-report` compiler option

`profile-loops-report`, `Qprofile-loops-report`

Controls the level of detail for the data collected when instrumentation occurs before and after certain loops.

Syntax

Linux OS and macOS:

```
-profile-loops-report[=n]
```

Windows OS:

```
/Qprofile-loops-report[:n]
```
Arguments

Is a value denoting the level of detail to report. Possible values are:

1
Reports the cycle counts on entry and exits of loops.
This is the default if \( n \) is not specified.

2
Reports the level 1 default details, but also includes
the loop min/max and average loop iteration counts.
To collect the loop iteration counts, additional
instrumentation is inserted. This can increase
overhead in the instrumented application and slow
performance.

Default

1
The report shows the cycle counts on entry and exits of loops.

Description

This option controls the level of detail for the data collected when instrumentation occurs before and after
certain loops. To use this option, you must also specify option [Q]profile-loops.
The report appears in file loop_prof_loops_<name>.dump, where <name> is a timestamp value for the run.
The columns listed in the report will be based on the level of detail that was selected during instrumentation.
It is recommended that the same report level be used for all files that are instrumented for the application. If
different files of the application were instrumented with different levels, the report will contain all the
columns of the highest detail level, but with default values for unavailable fields for files that were
instrumented at lower levels.

Qcov-dir

Specifies a directory for profiling information output
files that can be used with the codecov or tselect tool.

Syntax

Linux OS and macOS:
None

Windows OS:
/Qcov-dir:dir
**Arguments**

*dir*  
Is the name of the directory.

**Default**

OFF  
Profiling output files are placed in the directory where the program is compiled.

**Description**

This option specifies a directory for profiling information output files (*.dyn and *.dpi) that can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect). The specified directory must already exist.

You should specify this option using the same directory name for both instrumentation and feedback compilations. If you move the .dyn files, you need to specify the new path.

Option `/Qcov-dir` is equivalent to option `/Qprof-dir`. If you specify both options, the last option specified on the command line takes precedence.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

/Qcov-gen  
compiler option

/Qcov-file  
compiler option

**/Qcov-file**

*Specifies an alternate file name for the profiling summary files that can be used with the codecov or tselect tool.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Qcov-file:filename

**Arguments**

*filename*  
Is the name of the profiling summary file.

**Default**

OFF  
The profiling summary files have the file name `pgopti.*`. 
Description

This option specifies an alternate file name for the profiling summary files. The file name can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect).

The filename is used as the base name for the set of files created by different profiling passes.

If you specify this option with option /Qcov-gen, the .spi and .spl files will be named filename.spi and filename.spl instead of pgopti.spi and pgopti.spl.

Option /Qcov-file is equivalent to option /Qprof-file. If you specify both options, the last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

compiler option

Qcov-gen

*Produces an instrumented object file that can be used with the codecov or tselect tool.*

Syntax

Linux OS and macOS:

None

Windows OS:

/Qcov-gen
/Qcov-gen-

Arguments

None

Default

/Qcov-gen-

The instrumented object file is not produced.

Description

This option produces an instrumented object file that can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect). The instrumented code is included in the object file in preparation for instrumented execution.

This option also creates a static profile information file (.spi) that can be used with the codecov or tselect tool.

Option /Qcov-gen should be used to minimize the instrumentation overhead if you are interested in using the instrumentation only for code coverage. You should use /Qprof-gen:srcpos if you intend to use the collected data for code coverage and profile feedback.
IDE Equivalent

Optimization Report Options

**qopt-report, Qopt-report**
*Tells the compiler to generate an optimization report.*

Syntax

**Linux OS and macOS:**

- `qopt-report[=n]`

**Windows OS:**

/`Qopt-report[/n]`

Arguments

`n`  
(Optional) Indicates the level of detail in the report. You can specify values 0 through 5. If you specify zero, no report is generated. For levels `n=1` through `n=5`, each level includes all the information of the previous level, as well as potentially some additional information. Level 5 produces the greatest level of detail. If you do not specify `n`, the default is level 2, which produces a medium level of detail.

Default

OFF  
No optimization report is generated.

Description

This option tells the compiler to generate a collection of optimization report files, one per object; this is the same output produced by option [q or Q]opt-report-per-object.

If you prefer another form of output, you can specify option [q or Q]opt-report-file.

If you specify a level (`n`) higher than 5, a warning will be displayed and you will get a level 5 report.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS*) or `/Qopt-report-phase:all` (Windows*).

For a description of the information that each `n` level provides, see the Example section in option [q or Q]opt-report-phase.
**IDE Equivalent**
Visual Studio: **Diagnostics > Optimization Diagnostic Level**  
Eclipse: **Compilation Diagnostics > Optimization Diagnostic Level**  
Xcode: **Diagnostics > Optimization Diagnostic Level**

**Alternate Options**
None

**Example**
If you only want reports about certain diagnostics, you can use this option with option \[q or Q\]opt-report-phase. The phase you specify determines which diagnostics you will receive. For example, the following examples show how to get reports about certain specific diagnostics.

<table>
<thead>
<tr>
<th>To get this specific report</th>
<th>Specify</th>
</tr>
</thead>
</table>
| Auto-parallelizer diagnostics | Linux* and macOS*:  
-`-qopt-report -qopt-report-phase=par`  
Windows*:  
`/Qopt-report /Qopt-report-phase:par` |
| OpenMP parallelizer diagnostics | Linux* and macOS*:  
-`-qopt-report -qopt-report-phase=openmp`  
Windows*:  
`/Qopt-report /Qopt-report-phase:openmp` |
| Vectorizer diagnostics | Linux* and macOS*:  
-`-qopt-report -qopt-report-phase=vec`  
Windows*:  
`/Qopt-report /Qopt-report-phase:vec` |

**See Also**

`qopt-report-phase, Qopt-report-phase` compiler option

**qopt-report-annotate, Qopt-report-annotate**  
*Enables the annotated source listing feature and specifies its format.*

**Syntax**

**Linux OS and macOS:**

-`-qopt-report-annotate=[keyword]`

**Windows OS:**

`/Qopt-report-annotate[:keyword]`

**Arguments**

`keyword`  
Specifies the format for the annotated source listing. You can specify one of the following:
Indicates that the listing should be in text format. This is the default if you do not specify keyword.

Indicates that the listing should be in html format.

**Default**

**OFF**

No annotated source listing is generated

**Description**

This option enables the annotated source listing feature and specifies its format. The feature annotates source files with compiler optimization reports.

By default, one annotated source file is output per object. The annotated file is written to the same directory where the object files are generated. If the object file is a temporary file and an executable is generated, annotated files are placed in the directory where the executable is placed. You cannot generate annotated files to a directory of your choosing.

However, you can output annotated listings to stdout, stderr, or to a file if you also specify option \[q or Q\]opt-report-file.

By default, this option sets option \[q or Q\]opt-report with default level 2.

The following shows the file extension and listing details for the two possible *keywords*.

<table>
<thead>
<tr>
<th>Format</th>
<th>Listing Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>The annotated source listing has an .annot extension. It includes line numbers and compiler diagnostics placed after correspondent lines. IPO footnotes are inserted at the end of annotated file.</td>
</tr>
<tr>
<td>html</td>
<td>The annotated source listing has an .annot.html extension. It includes line numbers and compiler diagnostics placed after correspondent lines (as the text format does). It also provides hyperlinks in compiler messages and quick navigation with the routine list. IPO footnotes are displayed as tooltips.</td>
</tr>
</tbody>
</table>

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

- \[qopt-report-annotate-position\], \[Qopt-report-annotate-position\] compiler option

\[qopt-report-annotate-position\], \[Qopt-report-annotate-position\]

*Enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.*
Syntax

Linux OS and macOS:
-qopt-report-annotate-position=keyword

Windows OS:
/Qopt-report-annotate-position:keyword

Arguments

keyword

Specifies the site where optimization messages appear in the annotated source. You can specify one of the following:

- **caller**
  - Indicates that the messages should appear in the caller site.

- **callee**
  - Indicates that the messages should appear in the callee site.

- **both**
  - Indicates that the messages should appear in both the caller and the callee sites.

Default

OFF

No annotated source listing is generated

Description

This option enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.

This option enables option [q or Q]opt-report-annotate if it is not explicitly specified.

If annotated source listing is enabled and this option is not passed to compiler, loop optimizations are placed in caller position by default.

IDE Equivalent

None

Alternate Options

None

qopt-report, Qopt-report compiler option
qopt-report-annotate, Qopt-report-annotate compiler option

qopt-report-embed, Qopt-report-embed

Determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated.

Syntax

Linux OS and macOS:
-qopt-report-embed
-qno-opt-report-embed
Windows OS:
/Qopt-report-embed
/Qopt-report-embed-

Arguments
None

Default
OFF

When an assembly file is being generated, special loop information annotations will not be embedded in the assembly file.

However, if option -g (Linux* and macOS*) or /Zi (Windows*) is specified, special loop information annotations will be embedded in the assembly file unless option -qno-opt-report-embed (Linux and macOS*) or /Qopt-report-embed- (Windows) is specified.

Description
This option determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated. Specify the positive form of the option to include the annotations in the assembly file.

If an object file (or executable) is being generated, the annotations will be embedded in the object file (or executable).

If you use this option, you do not have to specify option [q or Q]opt-report.

Alternate Options
None

See Also
qopt-report, Qopt-report compiler option
qopt-report-file, Qopt-report-file
Specifies that the output for the optimization report goes to a file, stderr, or stdout.

Syntax
Linux OS and macOS:
-qopt-report-file=keyword

Windows OS:
/Qopt-report-file:keyword

Arguments
keyword

Specifies the output for the report. You can specify one of the following:

filename

Specifies the name of the file where the output should go.

stderr

Indicates that the output should go to stderr.
stdout Indicates that the output should go to stdout.

**Default**

**OFF** No optimization report is generated.

**Description**

This option specifies that the output for the optimization report goes to a file, stderr, or stdout.

If you use this option, you do not have to specify option [-q or Q]opt-report.

When optimization reporting is enabled, the default is -qopt-report-phase=all (Linux* and macOS*) or /Qopt-report-phase:all (Windows*).

**IDE Equivalent**

Visual Studio: **Diagnostics > Optimization Diagnostic File**

Diagnostics > Emit Optimization Diagnostic to File

Eclipse: **Compilation Diagnostics > Emit Optimization Diagnostics to File**

Compilation Diagnostics > Optimization Diagnostics File

Xcode: None

**Alternate Options**

None

**See Also**

qopt-report, Qopt-report compiler option

qopt-report-filter, Qopt-report-filter

*Tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application.*

**Syntax**

Linux OS and macOS:

-qopt-report-filter=string

Windows OS:

/Qopt-report-filter:string

**Arguments**

*string* Is the information to search for. The *string* must appear within quotes. It can take one or more of the following forms:

<table>
<thead>
<tr>
<th>Form</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
</tr>
<tr>
<td>filename, routine</td>
</tr>
<tr>
<td>filename, range [, range]...</td>
</tr>
<tr>
<td>filename, routine, range [, range]...</td>
</tr>
</tbody>
</table>
If you specify more than one of the above forms in a string, a semicolon must appear between each form. If you specify more than one range in a string, a comma must appear between each range. Optional blanks can follow each parameter in the forms above and they can also follow each form in a string.

**filename**

Specifies the name of a file to be found. It can include a path. If you do not specify a path, the compiler looks for the filename in the current working directory.

**routine**

Specifies the name of a routine to be found. You can include an identifying parameter. The name, including any parameter, must be enclosed in single quotes. The compiler tries to uniquely identify the routine that corresponds to the specified routine name. It may select multiple routines to analyze, especially if more than one routine has the specified routine name, so the routine cannot be uniquely identified.

**range**

Specifies a range of line numbers to be found in the file or routine specified. The range must be specified in integers in the form:

```
first_line_number-last_line_number
```

The hyphen between the line numbers is required.

**Default**

OFF

No optimization report is generated.

**Description**

This option tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application. Optimization reports will only be generated for the routines that contain the specified *string*.

On Linux* and macOS*, if you specify both `-qopt-report-routine=string1` and `-qopt-report-filter=string2`, it is treated as `-qopt-report-filter=string1;string2`. On Windows*, if you specify both `/Qopt-report-routine:string1` and `/Qopt-report-filter:string2`, it is treated as `/Qopt-report-filter:string1;string2`.

If you use this option, you do not have to specify option [q or Q]opt-report.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS*) or `/Qopt-report-phase:all` (Windows*).

**IDE Equivalent**

None

**Alternate Options**

None
See Also
qopt-report, Qopt-report compiler option
qopt-report-format, Qopt-report-format
Specifies the format for an optimization report.

Syntax
Linux OS and macOS:
-qopt-report-format=keyword
Windows OS:
/Qopt-report-format:keyword

Arguments
keyword

Specifies the format for the report. You can specify one of the following:

- text
  Indicates that the report should be in text format.
- vs
  Indicates that the report should be in Visual Studio* (IDE) format. The Visual Studio IDE uses the information to visualize the optimization report in the context of your program source code.

Default
OFF

No optimization report is generated.

Description
This option specifies the format for an optimization report. If you use this option, you must specify either text or vs.

If you do not specify this option and another option causes an optimization report to be generated, the default format is text.

If the [q or Q]opt-report-file option is also specified, it will affect where the output goes:

- If filename is specified, output goes to the specified file.
- If stdout is specified, output goes to stdout.
- If stderr is specified, output goes to stderr.

If you use this option, you do not have to specify option [q or Q]opt-report.

When optimization reporting is enabled, the default is -qopt-report-phase=all (Linux* and macOS*) or /Qopt-report-phase:all (Windows*).

IDE Equivalent
None

Alternate Options
None

qopt-report, Qopt-report compiler option
qopt-report-file, Qopt-report-file compiler option
**qopt-report-help, Qopt-report-help**
Displays the optimizer phases available for report generation and a short description of what is reported at each level.

### Syntax

**Linux OS and macOS:**
-qopt-report-help

**Windows OS:**
/Qopt-report-help

### Arguments

None

### Default

OFF

No optimization report is generated.

### Description

This option displays the optimizer phases available for report generation using [q or Q]opt-report-phase, and a short description of what is reported at each level. No compilation is performed.

To indicate where output should go, you can specify one of the following options:

- [q or Q]opt-report-file
- [q or Q]opt-report-per-object

If you use this option, you do not have to specify option [q or Q]opt-report.

### IDE Equivalent

None

### Alternate Options

None

### See Also

qopt-report, Qopt-report compiler option
qopt-report-phase, Qopt-report-phase compiler option
qopt-report-file, Qopt-report-file compiler option
qopt-report-per-object, Qopt-report-per-object compiler option

**qopt-report-per-object, Qopt-report-per-object**

Tell the compiler that optimization report information should be generated in a separate file for each object.

### Syntax

**Linux OS and macOS:**
-qopt-report-per-object

**Windows OS:**
/Qopt-report-per-object
Arguments
None

Default
OFF No optimization report is generated.

Description
This option tells the compiler that optimization report information should be generated in a separate file for each object.

If you specify this option for a single-file compilation, a file with a .optrpt extension is produced for every object file or assembly file that is generated by the compiler. For a multifile Interprocedural Optimization (IPO) compilation, one file is produced for each of the N true objects generated in the compilation. If only one true object file is generated, the optimization report file generated is called ipo_out.optrpt. If multiple true object files are generated (N>1), the names used are ipo_out1.optrpt, ipo_out2.optrpt, ... ipo_outN.optrpt.

The .optrpt files are written to the target directory of the compilation process. If an object or assembly file is explicitly generated, the corresponding .optrpt file is written to the same directory where the object file is generated. If the object file is just a temporary file and an executable is generated, the corresponding .optrpt files are placed in the directory in which the executable is placed.

If you use this option, you do not have to specify option [q or Q]opt-report.

When optimization reporting is enabled, the default is -qopt-report-phase=all (Linux* and macOS*) or /Qopt-report-phase:all (Windows*).

IDE Equivalent
None

Alternate Options
None

See Also
qopt-report, Qopt-report compiler option

qopt-report-phase, Qopt-report-phase
Specifies one or more optimizer phases for which optimization reports are generated.

Syntax

Linux OS and macOS:
-qopt-report-phase[=list]

Windows OS:
/Qopt-report-phase[:list]

Arguments

list (Optional) Specifies one or more phases to generate reports for. If you specify more than one phase, they must be separated with commas. The values you can specify are:
The phase for code generation
The phase for Interprocedural Optimization
The phase for loop nest optimization
The phase for Intel® MIC Architecture. This phase has no effect if option -no-qoffload or option /Qoffload- is specified. This phase only applies when targeting Intel® Xeon Phi™ products.
The phase for OpenMP
The phase for auto-parallelization
The phase for Profile Guided Optimization
The phase for trace collection
The phase for vectorization
All optimizer phases. This is the default if you do not specify list.

Default
OFF

No optimization report is generated.

Description
This option specifies one or more optimizer phases for which optimization reports are generated.

Note that phase offload causes the compiler to print a report of the input or output of variables that the host sends to the offload target and variables that the host receives from the target.

For certain phases, you also need to specify other options:

- If you specify phase cg, you must also specify option 01, 02 (default), or 03.
- If you specify phase ipo, you must also specify option [Q]ipo.
- If you specify phase loop, you must also specify option 02 (default) or 03.
- If you specify phase openmp, you must also specify option [q or Q]openmp.
- If you specify phase par, you must also specify option [Q]parallel.
- If you specify phase pgo, you must also specify option [Q]prof-use.
- If you specify phase tcollect, you must also specify option [Q]tcollect.
- If you specify phase vec, you must also specify option 02 (default) or 03. If you are interested in explicit vectorization by OpenMP* SIMD, you must also specify option [q or Q]openmp.

To find all phase possibilities, specify option [q or Q]opt-report-help.

If you use this option, you do not have to specify option [q or Q]opt-report.

However, if you want to get more details for each phase, specify option [q or Q]opt-report=n along with this option and indicate the level of detail you want by specifying an appropriate value for n. (See also the Example section below.)

When optimization reporting is enabled, the default is -qopt-report-phase=all (Linux* and macOS*) or /Qopt-report-phase:all (Windows*).
**IDE Equivalent**

Visual Studio: **Diagnostics > Optimization Diagnostic Phase**

Eclipse: **Compilation Diagnostics > Optimization Diagnostic Phase**

Xcode: **Diagnostics > Optimization Diagnostic Phase**

**Alternate Options**

None

**Example**

The following shows examples of the details you may receive when you specify one of the optimizer phases and a particular level \( n \) for option \([q \text{ or } Q]\text{opt-report}\). Note that details may change in future releases.

<table>
<thead>
<tr>
<th>Optimizer phase</th>
<th>The level specified in option ([q \text{ or } Q]\text{opt-report})</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cg</td>
<td>1</td>
<td>Generates a list of which intrinsics were lowered and which memcall optimizations were performed.</td>
</tr>
<tr>
<td>ipo</td>
<td>1</td>
<td>For each compiled routine, generates a list of the routines that were inlined into the routine, called directly by the routine, and whose calls were deleted.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details, values for important inlining command line options, and a list of the routines that were discovered to be dead and eliminated.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Generates level 2 details, whole program information, the sizes of inlined routines, and the reasons routines were not inlined.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Generates level 3 details, detailed footnotes on the reasons why routines are not inlined, and what action the user can take to get them inlined.</td>
</tr>
<tr>
<td>loop</td>
<td>1</td>
<td>Reports high-level details about which optimizations have been performed on the loop nests (along with the line number). Most of the loop optimizations (like fusion, unroll, unroll &amp; jam, collapsing, rerolling etc) only support this level of detail.</td>
</tr>
<tr>
<td>Optimizer phase</td>
<td>The level specified in <code>option[q or Q]opt-report</code></td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details, and provides more detail on the metrics and types of references (like prefetch distance, indirect prefetches etc) used in optimizations. Only a few optimizations (like prefetching, loop classification framework etc) support these extra details.</td>
</tr>
<tr>
<td>offload</td>
<td>1</td>
<td>Reports the file and line for each CPU offload and offload region.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Reports variables sent back and forth between the CPU and offload architecture.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Reports evaluation of length, <code>alloc_if</code>, <code>free_if</code>, and <code>align</code> clauses and assignments to memory locations. Note that the compiler changes default inout variables to either in or out based on usage.</td>
</tr>
<tr>
<td>openmp</td>
<td>1</td>
<td>Reports loops, regions, sections, and tasks successfully parallelized.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details, and messages indicating successful handling of master constructs, single constructs, critical constructs, ordered constructs, atomic pragmas, and so forth.</td>
</tr>
<tr>
<td>par</td>
<td>1</td>
<td>Reports which loops were parallelized.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details, and reports which loops were not parallelized along with a short reason.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Generates level 2 details, and prints the memory locations that are categorized as private, shared, reduction, etc..</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>For this phase, this is the same as specifying level 3.</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>Generates level 4 details, and dependency edges that inhibit parallelization.</td>
</tr>
<tr>
<td>Optimizer phase</td>
<td>The level specified in option [q or Q] opt-report</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>pgo</td>
<td>1</td>
<td>During profile feedback, generates report status of feedback (such as, profile used, no profile available, or unable to use profile) for each routine compiled.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details, and reports which value profile specializations took place for indirect calls and arithmetic operations.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Generates level 2 details, and reports which indirect calls had profile data, but did not meet the internal threshold limits for the percentage or execution count.</td>
</tr>
<tr>
<td>tcollect</td>
<td>1</td>
<td>Generates a list of routines and whether each was selected for trace collection.</td>
</tr>
<tr>
<td>vec</td>
<td>1</td>
<td>Reports which loops were vectorized.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generates level 1 details and reports which loops were not vectorized along with short reason.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Generates level 2 details, and vectorizer loop summary information.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Generates level 3 details, and greater detail about vectorized and non-vectorized loops.</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>Generates level 4 details, and details about any proven or assumed data dependences.</td>
</tr>
</tbody>
</table>

qopt-report, Qopt-report compiler option
qopt-report-help, Qopt-report-help compiler option

qopt-report-routine, Qopt-report-routine

*Tells the compiler to generate an optimization report for each of the routines whose names contain the specified substring.*
Syntax

Linux OS and macOS:
-qopt-report-routine=substring

Windows OS:
/Qopt-report-routine:substring

Arguments

substring

Is the text (string) to look for.

Default

OFF

No optimization report is generated.

Description

This option tells the compiler to generate an optimization report for each of the routines whose names contain the specified substring.

You can also specify a sequence of substrings separated by commas. If you do this, the compiler will generate an optimization report for each of the routines whose name contains one or more of these substrings.

If you use this option, you do not have to specify option [q or Q]opt-report.

When optimization reporting is enabled, the default is -qopt-report-phase=all (Linux* and macOS*) or /Qopt-report-phase:all (Windows*).

IDE Equivalent

Visual Studio: Diagnostics > Optimization Diagnostic Routine

Eclipse: Compilation Diagnostics > Optimization Diagnostic Routine

Xcode: None

Alternate Options

None

See Also

qopt-report, Qopt-report compiler option

qopt-report-names, Qopt-report-names

Specifies whether mangled or unmangled names should appear in the optimization report.

Syntax

Linux OS and macOS:
-qopt-report-names=keyword

Windows OS:
/Qopt-report-names:keyword
Arguments

Specifies the form for the names. You can specify one of the following:

- **mangled**: Indicates that the optimization report should contain mangled names.
- **unmangled**: Indicates that the optimization report should contain unmangled names.

Default

OFF

No optimization report is generated.

Description

This option specifies whether mangled or unmangled names should appear in the optimization report. If you use this option, you must specify either **mangled** or **unmangled**.

If this option is not specified, unmangled names are used by default.

If you specify **mangled**, encoding (also known as decoration) is added to names in the optimization report. This is appropriate when you want to match annotations with the assembly listing.

If you specify **unmangled**, no encoding (or decoration) is added to names in the optimization report. This is appropriate when you want to match annotations with the source listing.

If you use this option, you do not have to specify option [q or Q]opt-report.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS*) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report`, `Qopt-report` compiler option

tcollect, Qtcollect

*Inserts instrumentation probes calling the Intel® Trace Collector API.*

Syntax

**Linux OS:**

- `-tcollect[lib]`

**macOS:**

None

**Windows OS:**

`/Qtcollect[::lib]`
Arguments

*lib*

Is one of the Intel® Trace Collector libraries; for example, VT, VTcs, VTmc, or VTfs. If you do not specify *lib*, the default library is VT.

Default

**OFF**

Instrumentation probes are not inserted into compiled applications.

Description

This option inserts instrumentation probes calling the Intel® Trace Collector API.

This trace analyzing/collecting feature requires installation of another product. For more information, see Feature Requirements.

This option provides a flexible and convenient way of instrumenting functions of a compiled application. For every function, the entry and exit points are instrumented at compile time to let the Intel® Trace Collector record functions beyond the default MPI calls. For non-MPI applications (for example, threaded or serial), you must ensure that the Intel® Trace Collector is properly initialized (VT_initialze/VT_init).

**Caution**

Be careful with full instrumentation because this feature can produce very large trace files.

IDE Equivalent

None

Alternate Options

None

See Also

tcollect-filter, Qtcollect-filter

compiled option

tcollect-filter, Qtcollect-filter

*Lets you enable or disable the instrumentation of specified functions. You must also specify option [Q]tcollect.*

Syntax

**Linux OS:**

-tcollect-filter filename

**macOS:**

None

**Windows OS:**

/Qtcollect-filter:filename
Arguments

filename

Is a configuration file that lists filters, one per line. Each filter consists of a regular expression string and a switch. Strings with leading or trailing white spaces must be quoted. Other strings do not have to be quoted. The switch value can be ON, on, OFF, or off.

Default

OFF

Functions are not instrumented. However, if option -tcollect (Linux) or /Qtcollect (Windows) is specified, the filter setting is ".* ON" and all functions get instrumented.

Description

This option lets you enable or disable the instrumentation of specified functions. To get instrumentation with a specified filter (or filters), you must specify both option [Q]tcollect and option [Q]tcollect-filter.

During instrumentation, the regular expressions in the file are matched against the function names. The switch specifies whether matching functions are to be instrumented or not. Multiple filters are evaluated from top to bottom with increasing precedence.

The names of the functions to match against are formatted as follows:

- C++ function names are demangled and the C++ class hierarchy is used. Function parameters are stripped to keep the function names shorter.
- The source file name is followed by a colon-separated function name. Source file names should contain the full path, if available. For example:

  /home/joe/src/foo.c:FOO_bar

- Classes and function names are separated by double colons. For example:

  /home/joe/src/foo.cpp:app::foo::bar

You can use option [q or Q]opt-report to get a full list of file and function names that the compiler recognizes from the compilation unit. This list can be used as the basis for filtering in the configuration file.

This trace analyzing/collecting feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

None

Alternate Options

None

Consider the following filters in a configuration file:

'.*' OFF '.*vector.*' ON

The above will cause instrumentation of only those functions having the string 'vector' in their names. No other function will be instrumented. Note that reversing the order of the two lines will prevent instrumentation of all functions.
To get a list of the file or routine strings that can be matched by the regular expression filters, generate an optimization report with tcollect information. For example:

Windows: icl /Qtcollect /Qopt-report /Qopt-report-phase:tcollect

Linux: icc -tcollect -qopt-report -qopt-report-phase=tcollect

**See Also**
tcollect, Qtcollect
compiler option

---

**OpenMP® Options and Parallel Processing Options**

**fmpc-privatize**

*Enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.*

**Architecture Restrictions**

Only available on Intel® 64 architecture

**Syntax**

**Linux OS:**

- `fmpc-privatize`
- `fno-mpc-privatize`

**macOS:**

None

**Windows OS:**

None

**Arguments**

None

**Default**

- `fno-mpc-privatize`
  
  The privatization of all static data for the MPC unified parallel runtime is disabled.

**Description**

This option enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.

Option `-fmpc-privatize` causes calls to extended thread-local-storage (TLS) resolution, run-time routines that are not supported on standard Linux* distributions.

This option requires installation of another product. For more information, see Feature Requirements.

**IDE Equivalent**

None
Alternate Options
None

par-affinity, Qpar-affinity
Specifies thread affinity.

Syntax
Linux OS:
-par-affinity=[modifier,...]type[,permute][,offset]

macOS:
None

Windows OS:
/Qpar-affinity:[modifier,...]type[,permute][,offset]

Arguments

modifier
Is one of the following values: granularity={fine|thread|core|tile}, [no]respect, [no]verbose, [no]warnings, proclist=proc_list. The default is granularity=core, respect, and noverbose. For information on value proclist, see Thread Affinity Interface.

type
Indicates the thread affinity. This argument is required and must be one of the following values: compact, disabled, explicit, none, scatter, logical, physical. The default is none. Values logical and physical are deprecated. Use compact and scatter, respectively, with no permute value.

permute
Is a positive integer. You cannot use this argument with type setting explicit, none, or disabled. The default is 0.

offset
Is a positive integer. You cannot use this argument with type setting explicit, none, or disabled. The default is 0.

Default
OFF
The thread affinity is determined by the run-time environment.

Description
This option specifies thread affinity, which binds threads to physical processing units. It has the same effect as environment variable KMP_AFFINITY.
This option overrides the environment variable when both are specified.
This option only has an effect if the following is true:
- You have specified option [Q]parallel or option [q or Q]openmp (or both).
- You are compiling the main program.

NOTE
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.
par-num-threads, Qpar-num-threads
Specifies the number of threads to use in a parallel region.

Syntax

Linux OS and macOS:
-par-num-threads=n

Windows OS:
/Qpar-num-threads:n

Arguments

n
Is the number of threads to use. It must be a positive integer.

Default

OFF
The number of threads to use is determined by the run-time environment.

Description

This option specifies the number of threads to use in a parallel region. It has the same effect as environment variable OMP_NUM_THREADS.

This option overrides the environment variable when both are specified.

This option only has an effect if the following is true:

- You have specified option [Q]parallel or option [q or Q]openmp (or both).
- You are compiling the main program.

IDE Equivalent

None

Alternate Options

None

See Also

parallel, Qparallel compiler option
qopt-report, Qopt-report compiler option
par-runtime-control, Qpar-runtime-control
Generates code to perform run-time checks for loops that have symbolic loop bounds.

Syntax

Linux OS and macOS:
-par-runtime-control[n]
-no-par-runtime-control

Windows OS:
/Qpar-runtime-control[n]
/Qpar-runtime-control-

Arguments

$n$  Is a value denoting what kind of runtime checking to perform. Possible values are:

0  Performs no runtime check based on auto-parallelization. This is the same as specifying -no-par-runtime-control (Linux* and macOS*) or /Qpar-runtime-control- (Windows*).

1  Generates runtime check code under conservative mode. This is the default if you do not specify $n$.

2  Generates runtime check code under heuristic mode.

3  Generates runtime check code under aggressive mode.

Default

-no-par-runtime-control  The compiler uses default heuristics when checking loops.
/or/Qpar-runtime-control-

Description

This option generates code to perform run-time checks for loops that have symbolic loop bounds.

If the granularity of a loop is greater than the parallelization threshold, the loop will be executed in parallel.

If you do not specify this option, the compiler may not parallelize loops with symbolic loop bounds if the compile-time granularity estimation of a loop can not ensure it is beneficial to parallelize the loop.

NOTE
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

IDE Equivalent

None
Alternate Options
None

**par-schedule, Qpar-schedule**
* Lets you specify a scheduling algorithm for loop iterations.

---

**Syntax**

**Linux OS and macOS:**
- `--par-schedule=keyword[=n]`

**Windows OS:**
- `/Qpar-schedule=keyword[[:=]n]`

**Arguments**

`keyword`  
Specifies the scheduling algorithm or tuning method. Possible values are:

- `auto`  
  Lets the compiler or run-time system determine the scheduling algorithm.
- `static`  
  Divides iterations into contiguous pieces.
- `static-balanced`  
  Divides iterations into even-sized chunks.
- `static-steal`  
  Divides iterations into even-sized chunks, but allows threads to steal parts of chunks from neighboring threads.
- `dynamic`  
  Gets a set of iterations dynamically.
- `guided`  
  Specifies a minimum number of iterations.
- `guided-analytical`  
  Divides iterations by using exponential distribution or dynamic distribution.
- `runtime`  
  Defers the scheduling decision until run time.

`n`  
Is the size of the chunk or the number of iterations for each chunk. This setting can only be specified for static, dynamic, and guided. For more information, see the descriptions of each keyword below.

**Default**

`static-balanced`  
Iterations are divided into even-sized chunks and the chunks are assigned to the threads in the team in a round-robin fashion in the order of the thread number.

**Description**

This option lets you specify a scheduling algorithm for loop iterations. It specifies how iterations are to be divided among the threads of the team.

This option is only useful when specified with option `[Q]parallel`.

This option affects performance tuning and can provide better performance during auto-parallelization. It does nothing if it is used with option `[q or Q]openmp.`
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Q]par-schedule-auto</td>
<td>Lets the compiler or run-time system determine the scheduling algorithm. Any possible mapping may occur for iterations to threads in the team.</td>
</tr>
<tr>
<td>[Q]par-schedule-static</td>
<td>Divides iterations into contiguous pieces (chunks) of size ( n ). The chunks are assigned to threads in the team in a round-robin fashion in the order of the thread number. Note that the last chunk to be assigned may have a smaller number of iterations. If no ( n ) is specified, the iteration space is divided into chunks that are approximately equal in size, and each thread is assigned at most one chunk.</td>
</tr>
<tr>
<td>[Q]par-schedule-static-balanced</td>
<td>Divides iterations into even-sized chunks. The chunks are assigned to the threads in the team in a round-robin fashion in the order of the thread number.</td>
</tr>
<tr>
<td>[Q]par-schedule-static-steal</td>
<td>Divides iterations into even-sized chunks, but when a thread completes its chunk, it can steal parts of chunks assigned to neighboring threads. Each thread keeps track of ( L ) and ( U ), which represent the lower and upper bounds of its chunks respectively. Iterations are executed starting from the lower bound, and simultaneously, ( L ) is updated to represent the new lower bound.</td>
</tr>
<tr>
<td>[Q]par-schedule-dynamic</td>
<td>Can be used to get a set of iterations dynamically. Assigns iterations to threads in chunks as the threads request them. The thread executes the chunk of iterations, then requests another chunk, until no chunks remain to be assigned. As each thread finishes a piece of the iteration space, it dynamically gets the next set of iterations. Each chunk contains ( n ) iterations, except for the last chunk to be assigned, which may have fewer iterations. If no ( n ) is specified, the default is 1.</td>
</tr>
<tr>
<td>[Q]par-schedule-guided</td>
<td>Can be used to specify a minimum number of iterations. Assigns iterations to threads in chunks as the threads request them. The thread executes the chunk of iterations, then requests another chunk, until no chunks remain to be assigned. For a chunk of size 1, the size of each chunk is proportional to the number of unassigned iterations divided by the number of threads, decreasing to 1. For an ( n ) with value ( k ) (greater than 1), the size of each chunk is determined in the same way with the restriction that the chunks do not contain fewer iterations.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>[Q]par-schedule-guided-analytical</td>
<td>Divides iterations by using exponential distribution or dynamic distribution. The method depends on run-time implementation. Loop bounds are calculated with faster synchronization and chunks are dynamically dispatched at run time by threads in the team.</td>
</tr>
<tr>
<td>[Q]par-schedule-runtime</td>
<td>Defers the scheduling decision until run time. The scheduling algorithm and chunk size are then taken from the setting of environment variable OMP_SCHEDULE.</td>
</tr>
</tbody>
</table>

**NOTE**
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

**IDE Equivalent**
None

**Alternate Options**
None

**par-threshold, Qpar-threshold**
Sets a threshold for the auto-parallelization of loops.

**Syntax**

**Linux OS and macOS:**
- `par-threshold[n]`

**Windows OS:**
/`Qpar-threshold[:]:n`

**Arguments**

$n$

Is an integer whose value is the threshold for the auto-parallelization of loops. Possible values are 0 through 100.

If $n$ is 0, loops get auto-parallelized always, regardless of computation work volume.

If $n$ is 100, loops get auto-parallelized when performance gains are predicted based on the compiler analysis data. Loops get auto-parallelized only if profitable parallel execution is almost certain.
The intermediate 1 to 99 values represent the percentage probability for profitable speed-up. For example, \( n=50 \) directs the compiler to parallelize only if there is a 50% probability of the code speeding up if executed in parallel.

**Default**

-`-par-threshold100` or `/Qpar-threshold100`

Loops get auto-parallelized only if profitable parallel execution is almost certain. This is also the default if you do not specify \( n \).

**Description**

This option sets a threshold for the auto-parallelization of loops based on the probability of profitable execution of the loop in parallel. To use this option, you must also specify option `/Qparallel`.

This option is useful for loops whose computation work volume cannot be determined at compile-time. The threshold is usually relevant when the loop trip count is unknown at compile-time.

The compiler applies a heuristic that tries to balance the overhead of creating multiple threads versus the amount of work available to be shared amongst the threads.

**NOTE**

This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

**IDE Equivalent**

Visual Studio: None

Eclipse: **Optimization > Auto-Parallelization Threshold**

Xcode: **Optimization > Auto-Parallelization Threshold**

**Alternate Options**

None

**parallel, Qparallel**

*Tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.*

**Syntax**

**Linux OS and macOS:**

- `-parallel`

**Windows OS:**

`/Qparallel`(or `/Qpar`)

**Arguments**

None
## Default

**OFF**

Multithreaded code is not generated for loops that can be safely executed in parallel.

## Description

This option tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.

To use this option, you must also specify option **O2** or **O3**.

This option sets option **[q or Q]opt-matmul** if option **O3** is also specified.

### NOTE

On macOS* systems, when you enable automatic parallelization, you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

### NOTE

Using this option enables parallelization for both Intel® microprocessors and non-Intel microprocessors. The resulting executable may get additional performance gain on Intel microprocessors than on non-Intel microprocessors. The parallelization can also be affected by certain options, such as **/arch** or **/Qx** (Windows*) or **-m** or **-x** (Linux* and macOS*).

## Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

**parallel-source-info, Qparallel-source-info**

Enables or disables source location emission when OpenMP* or auto-parallelism code is generated.

**Syntax**

**Linux OS and macOS:**

- `-parallel-source-info[=n]`
  - `-no-parallel-source-info`

**Windows OS:**

- `/Qparallel-source-info`
  - `/Qparallel-source-info-[:n]`

**Arguments**

- `n`

  Is the level of source location emission. Possible values are:

  - **0**
    - Disables the emission of source location information when OpenMP* code or auto-parallelism code is generated. This is the same as specifying `-no-parallel-source-info` (Linux* and macOS*) or `/Qparallel-source-info-` (Windows*).
  
  - **1**
    - Tells the compiler to emit routine name and line information. This is the same as specifying `/Qparallel-source-info` with no `n`.
  
  - **2**
    - Tells the compiler to emit path, file, routine name, and line information.

**Default**

- `-parallel-source-info=1`
  - When OpenMP* code or auto-parallelism code is generated, the routine name and line information is emitted.

**Description**

This option enables or disables source location emission when OpenMP code or auto-parallelism code is generated. It also lets you set the level of emission.

**IDE Equivalent**

None

**Alternate Options**

None

**qopenmp, Qopenmp**

Enables the parallelizer to generate multi-threaded code based on OpenMP* directives.
Syntax

Linux OS and macOS:
-`-qopenmp`
-`-qno-openmp`

Windows OS:
`/Qopenmp`
`/Qopenmp-`

Arguments

None

Default

`-qno-openmp` or `/Qopenmp-`  No OpenMP* multi-threaded code is generated by the compiler.

Description

This option enables the parallelizer to generate multi-threaded code based on OpenMP* directives. The code can be executed in parallel on both uniprocessor and multiprocessor systems.

This option works with any optimization level. Specifying no optimization (`-O0` on Linux* or `/Od` on Windows*) helps to debug OpenMP applications.

**NOTE**

On macOS* systems, when you enable OpenMP* API, you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

**NOTE**

Options that use OpenMP* API are available for both Intel® microprocessors and non-Intel microprocessors, but these options may perform additional optimizations on Intel® microprocessors than they perform on non-Intel microprocessors. The list of major, user-visible OpenMP constructs and features that may perform differently on Intel® microprocessors versus non-Intel microprocessors include: locks (internal and user visible), the SINGLE construct, barriers (explicit and implicit), parallel loop scheduling, reductions, memory allocation, thread affinity, and binding.

Optimization Notice

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Linux and macOS*: `-fopenmp`

Windows: `/openmp`

**See Also**

qopenmp-stubs, Qopenmp-stubs compiler option

**qopenmp-lib, Qopenmp-lib**

*Lets you specify an OpenMP* run-time library to use for linking.*

**Syntax**

Linux OS and macOS:

```
-qopenmp-lib=type
```

Windows OS:

```
/Qopenmp-lib:type
```

**Arguments**

`type` Specifies the type of library to use; it implies compatibility levels. Currently, the only possible value is:

```
compat
```

Tells the compiler to use the compatibility OpenMP* run-time library (libiomp). This setting provides compatibility with object files created using Microsoft* and GNU* compilers.

**Default**

```
-qopenmp-lib=compat
```

or `Qopenmp-lib:compat`

The compiler uses the compatibility OpenMP* run-time library (libiomp).

**Description**

This option lets you specify an OpenMP* run-time library to use for linking.

The compatibility OpenMP run-time libraries are compatible with object files created using the Microsoft* OpenMP run-time library (vcomp) or the GNU OpenMP run-time library (libgomp).

To use the compatibility OpenMP run-time library, compile and link your application using the compat setting for option `qopenmp-lib`. To use this option, you must also specify one of the following compiler options:

- **Linux* systems**: `-qopenmp` or `-qopenmp-stubs`
- **Windows* systems**: `/Qopenmp` or `/Qopenmp-stubs`
On Windows* systems, the compatibility OpenMP* run-time library lets you combine OpenMP* object files compiled with the Microsoft® C/C++ compiler with OpenMP* object files compiled with the Intel® C, Intel® C++, or Intel® Fortran compilers. The linking phase results in a single, coherent copy of the run-time library.

On Linux* systems, the compatibility Intel OpenMP* run-time library lets you combine OpenMP* object files compiled with the GNU® gcc or gfortran compilers with similar OpenMP* object files compiled with the Intel® C, Intel® C++, or Intel® Fortran compilers. The linking phase results in a single, coherent copy of the run-time library.

**NOTE**
The compatibility OpenMP run-time library is not compatible with object files created using versions of the Intel compilers earlier than 10.0.

**NOTE**
On Windows* systems, this option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker. On Linux* and macOS* systems, this option is processed by the icc/icpc command that initiates linking, adding library names explicitly to the link command.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
qopenmp, Qopenmp compiler option
qopenmp-stubs, Qopenmp-stubs compiler option

**qopenmp-link**
Controls whether the compiler links to static or dynamic OpenMP* run-time libraries.

**Syntax**

**Linux OS and macOS:**
-qopenmp-link=library

**Windows OS:**
None

**Arguments**

library

Specifies the OpenMP library to use. Possible values are:

- static
  - Tells the compiler to link to static OpenMP run-time libraries. Note that static OpenMP libraries are deprecated.
- dynamic
  - Tells the compiler to link to dynamic OpenMP run-time libraries.
**Default**

-qopenmp-link=dynamic

The compiler links to dynamic OpenMP* run-time libraries. However, if Linux* option -static is specified, the compiler links to static OpenMP run-time libraries.

**Description**

This option controls whether the compiler links to static or dynamic OpenMP run-time libraries.

To link to the static OpenMP run-time library (RTL) and create a purely static executable, you must specify -qopenmp-link=static. However, we strongly recommend you use the default setting, -qopenmp-link=dynamic.

**NOTE**

Compiler options -static-intel and -shared-intel (Linux* and macOS*) have no effect on which OpenMP run-time library is linked.

**NOTE**

On Linux* systems, -qopenmp-link=dynamic cannot be used in conjunction with option -static. If you try to specify both options together, an error will be displayed.

**NOTE**

On Linux systems, the OpenMP runtime library depends on using libpthread and libc (libgcc when compiled with gcc). Libpthread and libc (libgcc) must both be static or both be dynamic. If both libpthread and libc (libgcc) are static, then the static version of the OpenMP runtime should be used. If both libpthread and libc (libgcc) are dynamic, then either the static or dynamic version of the OpenMP runtime may be used.

**IDE Equivalent**

None

**Alternate Options**

None

**qopenmp-offload, Qopenmp-offload**

Enables or disables OpenMP* offloading compilation for the target pragmas. This option only applies when targeting Intel® Xeon Phi™ products.

**Architecture Restrictions**

Only available when targeting Intel® Xeon Phi™ products

**Syntax**

Linux OS:

-qopenmp-offload[=device]

-qno-openmp-offload
macOS:
None

Windows OS:
/Qopenmp-offload[:device]
/Qopenmp-offload-

Arguments

device

Specifies the default device for target pragmas. Possible values are:

- **mic**: Specifies the target device is Intel® MIC Architecture; this is the default. This value is available for Windows* and Linux* systems on Intel® 64 architecture.
- **host**: OpenMP* offloading constructs are ignored. For Openmp* combined offload constructs, only the offloading part is ignored.

Default

-qno-openmp-offload or /Qopenmp-offload-

OpenMP* offloading compilation is disabled. However, if option [q or Q]openmp is specified, the default is ON and OpenMP offloading compilation is enabled.

Description

This option enables or disables OpenMP* offloading compilation for the target pragmas. When enabling offloading, it lets you specify what the default target device should be for the target pragmas. The default is mic.

You can also use this option if you want to enable or disable the offloading feature with no impact on other OpenMP* features. In this case, no OpenMP runtime library is needed to link and the compiler does not need to generate OpenMP runtime initialization code.

If you specify this option with the [q or Q]openmp option, it can impact other OpenMP* features.

IDE Equivalent

Visual Studio: **Code Generation [Intel C++] > Enable OpenMP Offloading Compilation and specify target device**

Eclipse: **Code Generation > Enable OpenMP Offloading Compilation**

**Code Generation > Target Device for OpenMP Offloading Compilation**

Xcode: None

Alternate Options

None

Example

Consider the following:

- `-qno-openmp -qopenmp-offload` ! Linux
- `/Qopenmp- /Qopenmp-offload` ! Windows
The above is equivalent to specifying only \([q \text{ or } Q]\)openmp-offload. In this case, only the offload library is linked, not the OpenMP* library, and only the \(!$OMP\) directives for TARGET are processed but no other \(!$OMP\) directives.

Consider the following:

<table>
<thead>
<tr>
<th>Linux</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>-qopenmp -qopenmp-offload</td>
<td>/Qopenmp /Qopenmp-offload</td>
</tr>
</tbody>
</table>

In this case, the offload library is linked, the OpenMP library is linked, and OpenMP runtime initialization code is generated.

**See Also**

qopenmp, Qopenmp compiler option

qopenmp-simd, Qopenmp-simd

*Enables or disables OpenMP* SIMD compilation.*

**Syntax**

**Linux OS and macOS:**

- `-qopenmp-simd`
- `-qno-openmp-simd`

**Windows OS:**

- `/Qopenmp-simd`
- `/Qopenmp-simd-`

**Arguments**

None

**Default**

- `-qopenmp-simd`
- `/Qopenmp-simd`

OpenMP* SIMD compilation is enabled if option \(O2\) or higher is in effect.

OpenMP* SIMD compilation is always disabled at optimization levels of \(O1\) or lower.

When option \(O2\) or higher is in effect, OpenMP SIMD compilation can only be disabled by specifying option `-qno-openmp-simd` or `/Qopenmp-simd-`. It is not disabled by specifying option `-qno-openmp` or `/Qopenmp-`.

**Description**

This option enables or disables OpenMP* SIMD compilation.

You can use this option if you want to enable or disable the SIMD support with no impact on other OpenMP features. In this case, no OpenMP runtime library is needed to link and the compiler does not need to generate OpenMP runtime initialization code.

If you specify this option with the \([q \text{ or } Q]\)openmp option, it can impact other OpenMP features.

**IDE Equivalent**

None

**Alternate Options**

None
Example

Consider the following:

```bash
-qo-openmp -qopenmp-simd ! Linux or macOS
/Qopenmp- /Qopenmp-simd ! Windows
```

The above is equivalent to specifying only `q` or `Q`openmp-simd. In this case, only SIMD support is provided, the OpenMP* library is not linked, and only the !$OMP directives related to SIMD are processed.

Consider the following:

```bash
-qopenmp -qopenmp-simd ! Linux or macOS
/Qopenmp /Qopenmp-simd ! Windows
```

In this case, SIMD support is provided, the OpenMP library is linked, and OpenMP runtime initialization code is generated.

See Also

`qopenmp`, `Qopenmp` compiler option

`qopenmp-stubs`, `Qopenmp-stubs`

*Enables compilation of OpenMP* programs in sequential mode.*

Syntax

Linux OS and macOS:

```bash
-qopenmp-stubs
```

Windows OS:

```bash
/Qopenmp-stubs
```

Arguments

None

Default

OFF

The library of OpenMP* function stubs is not linked.

Description

This option enables compilation of OpenMP* programs in sequential mode. The OpenMP directives are ignored and a stub OpenMP library is linked.

IDE Equivalent

Visual Studio: **Language > OpenMP Support**

Eclipse: **Language > Process OpenMP Directives**

Xcode: **Language > Process OpenMP Directives**

Alternate Options

None

See Also

`qopenmp`, `Qopenmp` compiler option
**qopenmp-threadprivate, Qopenmp-threadprivate**

* Lets you specify an OpenMP* threadprivate implementation.

### Syntax

**Linux OS:**

-qopenmp-threadprivate=type

**macOS:**

None

**Windows OS:**

/Qopenmp-threadprivate:type

### Arguments

<table>
<thead>
<tr>
<th>type</th>
<th>Specifies the type of threadprivate implementation. Possible values are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>legacy</td>
<td>Tells the compiler to use the legacy OpenMP* threadprivate implementation used in the previous releases of the Intel® compiler. This setting does not provide compatibility with the implementation used by other compilers.</td>
</tr>
<tr>
<td>compat</td>
<td>Tells the compiler to use the compatibility OpenMP* threadprivate implementation based on applying the __declspec(thread) attribute to each threadprivate variable. The limitations of the attribute on a given platform also apply to the threadprivate implementation. This setting provides compatibility with the implementation provided by the Microsoft* and GNU* compilers.</td>
</tr>
</tbody>
</table>

### Default

-qopenmp-threadprivate=legacy  
/Qopenmp-threadprivate:legacy

### Description

This option lets you specify an OpenMP* threadprivate implementation.

The threadprivate implementation of the legacy OpenMP run-time library may not be compatible with object files created using OpenMP run-time libraries supported in other compilers.

To use this option, you must also specify one of the following compiler options:

- **Linux* systems**: -qopenmp or -qopenmp-stubs
- **Windows* systems**: /Qopenmp or /Qopenmp-stubs

The value specified for this option is independent of the value used for the [q or Q]openmp-lib option.
NOTE
On macOS* systems, legacy is the only type of threadprivate supported. Option -qopenmp-threadprivate is not recognized by the compiler.

IDE Equivalent
None

Alternate Options
None

Qpar-adjust-stack
*Tells the compiler to generate code to adjust the stack size for a fiber-based main thread.*

Syntax

**Linux OS and macOS:**
None

**Windows OS:**
/Qpar-adjust-stack:n

Arguments

*n*  
Is the stack size (in bytes) for the fiber-based main thread. It must be a number equal to or greater than zero.

Default

/Qpar-adjust-stack:0  
No adjustment is made to the main thread stack size.

Description

This option tells the compiler to generate code to adjust the stack size for a fiber-based main thread. This can reduce the stack size of threads.

For this option to be effective, you must also specify option /Qparallel.

IDE Equivalent
None

Alternate Options
None

See Also
parallel, Qparallel compiler option

Floating-Point Options

fast-transcendentals, Qfast-transcendentals
*Enables the compiler to replace calls to transcendental functions with faster but less precise implementations.*
Syntax

Linux OS and macOS:
- `fast-transcendentals`
- `no-fast-transcendentals`

Windows OS:
/Qfast-transcendentals
/Qfast-transcendentals-

Arguments
None

Default

depends on the setting of `-fp-model` (Linux* and macOS*) or `/fp` (Windows*)

If you do not specify option `-[no-]fast-transcendentals` or option `/Qfast-transcendentals[-]`:

- The default is ON if option `-fp-model fast` or `/fp:fast` is specified or is in effect.
- The default is OFF if a value-safe setting is specified for `-fp-model` or `/fp` (such as "precise", "source", etc.).

Description

This option enables the compiler to replace calls to transcendental functions with implementations that may be faster but less precise.

It allows the compiler to perform certain optimizations on transcendental functions, such as replacing individual calls to sine in a loop with a single call to a less precise vectorized sine library routine. These optimizations can cause numerical differences that would not otherwise exist if you are also compiling with a value-safe option such as `-fp-model precise` (Linux* and macOS*) or `/fp:precise` (Windows).

For example, you may get different results if you specify option `O0` versus option `O2`, or you may get different results from calling the same function with the same input at different points in your program. If these kinds of numerical differences are problematic, consider using option `-fimf-use-svml` (Linux* and macOS*) or `/Qfimf-use-svml` (Windows) as an alternative. When used with a value-safe option such as `-fp-model precise` or `/fp:precise`, option `-fimf-use-svml` or `/Qfimf-use-svml` provides many of the positive performance benefits of `/Qfast-transcendentals` without negatively affecting numeric consistency. For more details, see the description of option `-fimf-use-svml` and `/Qfimf-use-svml`.

This option does not affect explicit Short Vector Math Library (SVML) intrinsics. It only affects scalar calls to the standard math library routines.

You cannot use option `-fast-transcendentals` with option `-fp-model strict` and you cannot use option `/Qfast-transcendentals` with option `/fp:strict`.

This option determines the setting for the maximum allowable relative error for math library function results (`max-error`) if none of the following options are specified:

- `-fimf-accuracy-bits` (Linux* and macOS*) or `/Qfimf-accuracy-bits` (Windows*)
- `-fimf-max-error` (Linux and macOS*) or `/Qfimf-max-error` (Windows)
- `-fimf-precision` (Linux and macOS*) or `/Qfimf-precision` (Windows)

This option enables extra optimization that only applies to Intel® processors.
### Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

- `fimf-precision, Qimf-precision` compiler option

#### fimf-absolute-error, Qimf-absolute-error

Defines the maximum allowable absolute error for math library function results.

### Syntax

**Linux OS and macOS:**

```
-fimf-absolute-error=value[:funclist]
```

**Windows OS:**

```
/Qimf-absolute-error:value[:funclist]
```

### Arguments

- **value**

  Is a positive, floating-point number. Errors in math library function results may exceed the maximum relative error (max-error) setting if the absolute-error is less than or equal to `value`.

  The format for the number is `[digits] [.digits] [ { e | E }[sign]digits]`

- **funclist**

  Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

  Precision-specific variants like `sin` and `sinf` are considered different functions, so you would need to use `-fimf-absolute-error=0.00001:sin,sinf`
(or /Qimf-absolute-error:0.00001:sin,sinf) to specify the maximum allowable absolute error for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify -fimf-absolute-error=0.00001:/ or /Qimf-absolute-error: 0.00001:/. 

Default

Zero ("0")

An absolute-error setting of 0 means that the function is bound by the relative error setting. This is the default behavior.

Description

This option defines the maximum allowable absolute error for math library function results.

This option can improve run-time performance, but it may decrease the accuracy of results.

This option only affects functions that have zero as a possible return value, such as log, sin, asin, etc.

The relative error requirements for a particular function are determined by options that set the maximum relative error (max-error) and precision. The return value from a function must have a relative error less than the max-error value, or an absolute error less than the absolute-error value.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in -fimf-absolute-error=0.00001:sin or /Qimf-absolute-error:0.00001:sin, or -fimf-absolute-error=0.00001:sqrtf or /Qimf-absolute-error:0.00001:sqrtf.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

NOTE

Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804
fimf-accuracy-bits, Qimf-accuracy-bits compiler option
fimf-arch-consistency, Qimf-arch-consistency compiler option
fimf-domain-exclusion, Qimf-domain-exclusion compiler option
fimf-max-error, Qimf-max-error compiler option
fimf-precision, Qimf-precision compiler option
fimf-use-svml_Qimf-use-svml compiler option

fimf-accuracy-bits, Qimf-accuracy-bits

Defines the relative error for math library function results, including division and square root.

Syntax

Linux OS and macOS:
-fimf-accuracy-bits=bits[ :funclist]

Windows OS:
/Qimf-accuracy-bits:bits[ :funclist]

Arguments

bits

Is a positive, floating-point number indicating the number of correct bits the compiler should use.

The format for the number is [digits] [.digits] [ { e | E }[sign]digits].

funclist

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sinf are considered different functions, so you would need to use -fimf-accuracy-bits=23: sin, sinf (or /Qimf-accuracy-bits:23: sin, sinf) to specify the relative error for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify -fimf-accuracy-bits=10.0:/f or /Qimf-accuracy-bits:10.0:/f.

Default

-fimf-precision=medium or /Qimf-precision:medium

The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.
Description

This option defines the relative error, measured by the number of correct bits, for math library function results.

The following formula is used to convert bits into ulps: \( \text{ulps} = 2^{p-1-bits} \), where \( p \) is the number of the target format mantissa bits (24, 53, and 64 for single, double, and long double, respectively).

This option can affect run-time performance and the accuracy of results.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify \(:\text{sin}; \) if you want single precision, you can specify \(:\text{sinf}, \) as in the following:

- \(-\text{fimf-accuracy-bits}=23:\text{sinf},\cosf,\logf\) or \(/\text{Qimf-accuracy-bits}:23:\text{sinf},\cosf,\logf\)
- \(-\text{fimf-accuracy-bits}=52:\text{sqrt},\div,\text{trunc}\) or \(/\text{Qimf-accuracy-bits}:52:\text{sqrt},\div,\text{trunc}\)
- \(-\text{fimf-accuracy-bits}=10:\text{powf}\) or \(/\text{Qimf-accuracy-bits}:10:\text{powf}\)

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, \(\text{sinf}\) applies only to the single-precision sine function, \(\text{sin}\) applies only to the double-precision sine function, \(\text{sinl}\) applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- \(-\text{fimf-precision} \) (Linux* and macOS*) or \(/\text{Qimf-precision} \) (Windows*)
- \(-\text{fimf-max-error} \) (Linux* and macOS*) or \(/\text{Qimf-max-error} \) (Windows*)
- \(-\text{fimf-accuracy-bits} \) (Linux and macOS*) or \(/\text{Qimf-accuracy-bits} \) (Windows)

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

- [Q]fast-transcendentals
- [Q]prec-div
- [Q]prec-sqrt
- \(-\text{fp-model} \) (Linux and macOS*) or \(/\text{fp} \) (Windows)

**NOTE**

Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.
IDE Equivalent

fimf-precision, Qimf-precision compiler option
fimf-use-svml_Qimf-use-svml compiler option

**fimf-arch-consistency, Qimf-arch-consistency**
Ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture.

**Syntax**

**Linux OS and macOS:**
- `fimf-arch-consistency=value[:funclist]

**Windows OS:**
/`Qimf-arch-consistency:value[:funclist]

**Arguments**

*value*  
Is one of the logical values "true" or "false".

*funclist*  
Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sincf are considered different functions, so you would need to use
- `fimf-arch-consistency=true:sin,sincf`
(or `/Qimf-arch-consistency:true:sin,sinf`) to specify consistent results for both the single-precision and double-precision sine functions.

You also can specify the symbol `/f` to denote single-precision divides, symbol `/` to denote double-precision divides, symbol `/l` to denote extended-precision divides, and symbol `/q` to denote quad-precision divides. For example you can specify `-fimf-arch-consistency=true:/`
or `/Qimf-arch-consistency=true:/`

**Default**
false  
Implementations of some math library functions may produce slightly different results on implementations of the same architecture.
**Description**

This option ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture (for example, across different microarchitectural implementations of IA-32 architecture). Consistency is only guaranteed for a single binary. Consistency is not guaranteed across different architectures. For example, consistency is not guaranteed across IA-32 architecture and Intel® 64 architecture.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-arch-consistency=true:sin` or `/Qimf-arch-consistency:true:sin`, or `-fimf-arch-consistency=false:sqrtf` or `/Qimf-arch-consistency:false:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, `sinf` applies only to the single-precision sine function, `sin` applies only to the double-precision sine function, `sinl` applies only to the extended-precision sine function, etc.

The `-fimf-arch-consistency` (Linux* and macOS*) and `/Qimf-arch-consistency` (Windows*) option may decrease run-time performance, but the option will provide bit-wise consistent results on all Intel® processors and compatible, non-Intel processors, regardless of micro-architecture. This option may not provide bit-wise consistent results between different architectures, for example, between IA-32 and Intel® 64 architectures, or between Intel® 64 architecture and Intel® MIC Architecture.

**NOTE**

Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

---

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

**fimf-domain-exclusion, Qimf-domain-exclusion**

*Indicates the input arguments domain on which math functions must provide correct results.*

**Syntax**

**Linux OS and macOS:**

`-fimf-domain-exclusion=classlist[:funclist]`

**Windows OS:**

`/Qimf-domain-exclusion:classlist[:funclist]`

**Arguments**

*classlist*  

Is one of the following:

- One or more of the following floating-point value classes you can exclude from the function domain without affecting the correctness of your program. The supported class names are:

  - **extremes**: This class is for values which do not lie within the usual domain of arguments for a given function.
  - **nans**: This means "x=Nan".
  - **infinities**: This means "x=infinities".
  - **denormals**: This means "x=denormal".
  - **zeros**: This means "x=0".

Each *classlist* element corresponds to a power of two. The exclusion attribute is the logical or of the associated powers of two (that is, a bitmask).

The following shows the current mapping from *classlist* mnemonics to numerical values:

<table>
<thead>
<tr>
<th>class</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>extremes</td>
<td>1</td>

<tr>
<td>all</td>
<td>31</td>
</tr>
<tr>
<td>common</td>
<td>15</td>
</tr>
<tr>
<td>other combinations</td>
<td>bitwise OR of the used values</td>
</tr>
</tbody>
</table>

You must specify the integer value that corresponds to the class that you want to exclude.
Note that on excluded values, unexpected results may occur.

- One of the following short-hand tokens:

  - **none**
    
    This means that none of the supported classes are excluded from the domain. To indicate this token, specify 0, as in `-fimf-domain-exclusion=0` (or `/Qimf-domain-exclusion:0`).

  - **all**
    
    This means that all of the supported classes are excluded from the domain. To indicate this token, specify 31, as in `-fimf-domain-exclusion=31` (or `/Qimf-domain-exclusion:31`).

  - **common**
    
    This is the same as specifying extremes,nans,infinites,denormals. To indicate this token, specify 15 (1 + 2 + 4 + 8), as in `-fimf-domain-exclusion=15` (or `/Qimf-domain-exclusion:15`).

---

**funclist**

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-domain-exclusion=4:sin,sinf` (or `/Qimf-domain-exclusion:4:sin,sinf`) to specify infinites for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example, you can specify:

- `-fimf-domain-exclusion=4` or `/Qimf-domain-exclusion:4`
- `-fimf-domain-exclusion=5:/,powf` or `/Qimf-domain-exclusion:5:/,powf`
- `-fimf-domain-exclusion=23:log,logf,/,sin,cosf` or `/Qimf-domain-exclusion:23:log,logf,/,sin,cosf`

If you don’t specify argument **funclist**, the domain restrictions apply to all math library functions.

---

**Default**

Zero ("0")

The compiler uses default heuristics when calling math library functions.

**Description**

This option indicates the input arguments domain on which math functions must provide correct results. It specifies that your program will function correctly if the functions specified in **funclist** do not produce standard conforming results on the number classes.

This option can affect run-time performance and the accuracy of results. As more classes are excluded, faster code sequences can be used.
If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify `:sin`; if you want single precision, you can specify `:sinf`, as in `-fimf-domain-exclusion=denormals:sin` or `/Qfimf-domain-exclusion:denormals:sin`, or `-fimf-domain-exclusion=extremes:sqrtf` or `/Qfimf domain-exclusion:extremes:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, `sinf` applies only to the single-precision sine function, `sin` applies only to the double-precision sine function, `sinl` applies only to the extended-precision sine function, etc.

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

**Optimization Notice**

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

Consider the following single-precision sequence for function `exp2f`:

<table>
<thead>
<tr>
<th>Operation</th>
<th>y = exp2f(x)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accuracy</td>
<td>1.014 ulp</td>
</tr>
<tr>
<td>Instructions</td>
<td>4 (2 without fix-up)</td>
</tr>
</tbody>
</table>

The following shows the 2-instruction sequence without the fix-up:

```
vcvtfpntps2dq  zmm1 {k1}, zmm0, 0x50      // zmm1 <-- rndToInt(2^24 * x)
vexp223ps       zmm1 {k1}, zmm1            // zmm1 <-- exp2(x)
```

However, the above 2-instruction sequence will not correctly process NaNs. To process NaNs correctly, the following fix-up must be included following the above instruction sequence:

```
vpxord         zmm2, zmm2, zmm2              // zmm2 <-- 0
vfixupnanps    zmm1 {k1}, zmm0, zmm2 {aaaa} // zmm1 <-- QNaN(x) if x is NaN <F>
```
If the `vfixupnanps` instruction is not included, the sequence correctly processes any arguments except NaN values. For example, the following options generate the 2-instruction sequence:

- `-fimf-domain-exclusion=2:exp2f` <- NaN's are excluded (2 corresponds to NaNs)
- `-fimf-domain-exclusion=6:exp2f` <- NaN's and infinities are excluded (4 corresponds to infinities; 2 + 4 = 6)
- `-fimf-domain-exclusion=7:exp2f` <- NaN's, infinities, and extremes are excluded (1 corresponds to extremes; 2 + 4 + 1 = 7)
- `-fimf-domain-exclusion=15:exp2f` <- NaN's, infinities, extremes, and denormals are excluded (8 corresponds to denormals; 2 + 4 + 1 + 8 = 15)

If the `vfixupnanps` instruction is included, the sequence correctly processes any arguments including NaN values. For example, the following options generate the 4-instruction sequence:

- `-fimf-domain-exclusion=1:exp2f` <- only extremes are excluded (1 corresponds to extremes)
- `-fimf-domain-exclusion=4:exp2f` <- only infinities are excluded (4 corresponds to infinities)
- `-fimf-domain-exclusion=8:exp2f` <- only denormals are excluded (8 corresponds to denormals)
- `-fimf-domain-exclusion=13:exp2f` <- only extremes, infinities and denormals are excluded (1 + 4 + 8 = 13)

**fimf-force-dynamic-target**, `Qimf-force-dynamic-target`  
*Instructs the compiler to use run-time dispatch in calls to math functions.*

**Syntax**

**Linux OS and macOS:**

- `-fimf-force-dynamic-target[=funclist]`

**Windows OS:**

/`Qimf-force-dynamic-target[::funclist]`

**Arguments**

*funclist*  

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sincf are considered different functions, so you would need to use `-fimf-dynamic-target=sin,sinfcf` (or `/Qimf-dynamic-target:sin,sinfcf`) to specify run-time dispatch for both the single-precision and double-precision sine functions.

You also can specify the symbol `/f` to denote single-precision divides, symbol `/d` to denote double-precision divides, symbol `/l` to denote extended-precision divides, and symbol `/q` to denote quad-precision divides. For example, you can specify `-fimf-dynamic-target=/'` or `/Qimf-dynamic-target::/`.  

318
**Default**

OFF  
Run-time dispatch is not forced in math libraries calls. The compiler can choose to call a CPU-specific version of a math function if one is available.

**Description**

This option instructs the compiler to use run-time dispatch in calls to math functions. When this option set to ON, it lets you force run-time dispatch in math libraries calls.

By default, when this option is set to OFF, the compiler often optimizes math library calls using the target CPU architecture-specific information available at compile time through the [Q]x and arch compiler options.

If you want to target multiple CPU families with a single application or you prefer to choose a target CPU at run time, you can force run-time dispatch in math libraries by using this option.

**fimf-max-error, Qimf-max-error**

Defines the maximum allowable relative error for math library function results, including division and square root.

**Syntax**

**Linux OS and macOS:**

-fimf-max-error=ulps[:funclist]

**Windows OS:**

/Qimf-max-error:ulps[:funclist]
Arguments

ulps

Is a positive, floating-point number indicating the maximum allowable relative error the compiler should use.

The format for the number is [digits] [.digits] [ { e | E}[sign]digits].

funclist

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sinf are considered different functions, so you would need to use -fimf-max-error=4.0:sin,sinf (or /Qimf-max-error=4.0:sin,sinf) to specify the maximum allowable relative error for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify -fimf-max-error=4.0: / or /Qimf-max-error:4.0: /.

Default

-fimf-precision=medium or /Qimf-precision:medium

The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.

Description

This option defines the maximum allowable relative error, measured in ulps, for math library function results.

This option can affect run-time performance and the accuracy of results.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in -fimf-max-error=4.0: sin or /Qimf-max-error:4.0: sin, or -fimf-max-error=4.0: sqrtf or /Qimf-max-error:4.0: sqrtf.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- -fimf-precision (Linux* and macOS*) or /Qimf-precision (Windows*)
- -fimf-max-error (Linux* and macOS*) or /Qimf-max-error (Windows*)
- -fimf-accuracy-bits (Linux and macOS*) or /Qimf-accuracy-bits (Windows)

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

- [Q]fast-transcendentals
- [Q]prec-div
- [Q]prec-sqrt
- -fp-model (Linux and macOS*) or /fp (Windows)
NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

`fimf-use-svml_Qimf-use-svml` compiler option

**fimf-precision, Qimf-precision**

*Let's you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.*

**Syntax**

**Linux OS and macOS:**

```bash
-fimf-precision=value[:funclist]
```

**Windows OS:**

```bash
/Qimf-precision[:value[:funclist]]
```

**Arguments**

`value`  
Is one of the following values denoting the desired accuracy:

- `high`  
  This is equivalent to max-error = 1.0.
medium

This is equivalent to max-error = 4; this is the default setting if the option is specified and value is omitted.

low

This is equivalent to accuracy-bits = 11 for single-precision functions; accuracy-bits = 26 for double-precision functions.

In the above explanations, max-error means option

-fimf-max-error (Linux* and macOS*) or /Qimf-max-error (Windows*)

accuracy-bits means option

-fimf-accuracy-bits (Linux* and macOS*) or /Qimf-accuracy-bits (Windows*).

funclist

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sinf are considered different functions, so you would need to use

-fimf-precision=high:sin,sinf (or /Qimf-precision:high:sin,sinf) to specify high precision for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example, you can specify

-fimf-precision=low:/ or /Qimf-precision:low:/ and -fimf-precision=low:/f or /Qimf-precision:low:/f.

Default

medium

The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.

Description

This option lets you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.

This option can be used to improve run-time performance if reduced accuracy is sufficient for the application, or it can be used to increase the accuracy of math library functions selected by the compiler.

In general, using a lower precision can improve run-time performance and using a higher precision may reduce run-time performance.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- -fimf-precision (Linux* and macOS*) or /Qimf-precision (Windows*)
- -fimf-max-error (Linux* and macOS*) or /Qimf-max-error (Windows*)
• `-fimf-accuracy-bits (Linux and macOS*) or `/Qimf-accuracy-bits (Windows)`

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

• `[Q]fast-transcendentals`
• `[Q]prec-div`
• `[Q]prec-sqrt`
• `-fp-model (Linux and macOS*) or `/fp (Windows)`

**NOTE**
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

### Optimization Notice

`fimf-use-svml_Qimf-use-svml` compiler option

**fimf-use-svml, Qimf-use-svml**

*Instructs the compiler to use the Short Vector Math Library (SVML) rather than the Intel® Math Library (LIBM) to implement math library functions.*
**Syntax**

**Linux OS and macOS:**

- `fimf-use-svml=value[:funclist]`

**Windows OS:**

/`Qimf-use-svml:value[:funclist]`

**Arguments**

*funclist*

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like `sin` and `sinf` are considered different functions, so you would need to use `-fimf-use-svmlt=true:sin,sinf` (or `/Qimf-use-svmlt=true:sin,sinf`) to specify that both the single-precision and double-precision sine functions should use SVML.

**Default**

false

Math library functions are implemented using the Intel® Math Library, though other compiler options such as `-fast-transcendentals` or `/Qfast-transcendentals` give the compiler the flexibility to implement math library functions with either LIBM or SVML.

**Description**

This option instructs the compiler to implement math library functions using the Short Vector Math Library (SVML). When you specify `-fimf-use-svml=true` or `/Qimf-use-svml=true`, the specific SVML variant chosen is influenced by other compiler options such as `-fimf-precision` (Linux* and macOS*) or `/Qimf-precision` (Windows*) and `-fp-model` (Linux and macOS*) or `/fp` (Windows). This option has no effect on math library functions that are implemented in LIBM but not in SVML.

In value-safe settings of option `-fp-model` (Linux and macOS*) or option `/fp` (Windows) such as precise, this option causes a slight decrease in the accuracy of math library functions, because even the high accuracy SVML functions are slightly less accurate than the corresponding functions in LIBM. Additionally, the SVML functions might not accurately raise floating-point exceptions, do not maintain errno, and are designed to work correctly only in round-to-nearest-even rounding mode.

The benefit of using `-fimf-use-svml=true` or `/Qimf-use-svml=true` with value-safe settings of `-fp-model` (Linux and macOS*) or `/fp` (Windows) is that it can significantly improve performance by enabling the compiler to efficiently vectorize loops containing calls to math library functions.

If you need to use SVML for a specific math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify `:sin`; if you want single precision, you can specify `:sqrdf`, as in `-fimf-use-svmlt=true:sin` or `/Qimf-use-svmlt=true:sin`, or `-fimf-use-svml=false:sqrdf` or `/Qimf-use-svml=false:sqrdf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, `sinf` applies only to the single-precision sine function, `sin` applies only to the double-precision sine function, `sinl` applies only to the extended-precision sine function, etc.
NOTE
If you specify option -mia32 (Linux*) or option /arch:IA32 (Windows*), vector instructions cannot be used. Therefore, you cannot use Linux* option -mia32 with option -fimf-use-svml=true, and you cannot use Windows* option /arch:IA32 with option /Qimf-use-svml:true.

NOTE
Since SVML functions may raise unexpected floating-point exceptions, be cautious about using features that enable trapping on floating-point exceptions. For example, be cautious about specifying option -fimf-use-svml=true with option -fp-trap, or option /Qimf-use-svml:true with option /Qfp-trap. For some inputs to some math library functions, such option combinations may cause your program to trap unexpectedly.

fma, Qfma
Determines whether the compiler generates fused multiply-add (FMA) instructions if such instructions exist on the target processor.

Syntax
Linux OS and macOS:
- fma
- no-fma
Windows OS:
/Qfma
/Qfma-

Arguments
None

Default
-fma or /Qfma

If the instructions exist on the target processor, the compiler generates fused multiply-add (FMA) instructions.

However, if you specify -fp-model strict (Linux* and macOS*) or /fp:strict (Windows*), but do not explicitly specify -fma or /Qfma, the default is -no-fma or /Qfma-.

Description
This option determines whether the compiler generates fused multiply-add (FMA) instructions if such instructions exist on the target processor. When the [Q]fma option is specified, the compiler may generate FMA instructions for combining multiply and add operations. When the negative form of the [Q]fma option is specified, the compiler must generate separate multiply and add instructions with intermediate rounding.

This option has no effect unless setting CORE-AVX2 or higher is specified for option [Q]x, -march (Linux and macOS*), or /arch (Windows).

IDE Equivalent
None

fp-model, fp
Controls the semantics of floating-point calculations.

Syntax
Linux OS and macOS:
-fp-model keyword

Windows OS:
/fp:keyword

Arguments
keyword Specifies the semantics to be used. Possible values are:

precise Disables optimizations that are not value-safe on floating-point data.
fast[=1|2] Enables more aggressive optimizations on floating-point data.

consistent Enables consistent, reproducible results for different optimization levels or between different processors of the same architecture.

strict Enables precise and except, disables contractions, and enables pragma stdc fenv_access.

source Rounds intermediate results to source-defined precision.

double Rounds intermediate results to 53-bit (double) precision.

extended Rounds intermediate results to 64-bit (extended) precision.

=no-]except (Linux* and macOS*) or except[-] (Windows* ) Determines whether strict floating-point exception semantics are honored.

Default

-fp-model fast=1 or /fp:fast=1 The compiler uses more aggressive optimizations on floating-point calculations.

Description

This option controls the semantics of floating-point calculations.

The keywords can be considered in groups:

• Group A: precise, fast, consistent, strict
• Group B: source, double, extended
• Group C: except (or the negative form)

You can use more than one keyword. However, the following rules apply:

• You cannot specify fast and except together in the same compilation. You can specify any other combination of group A, group B, and group C. Since fast is the default, you must not specify except without a group A or group B keyword.
• You should specify only one keyword from group A and only one keyword from group B. If you try to specify more than one keyword from either group A or group B, the last (rightmost) one takes effect.
• If you specify except more than once, the last (rightmost) one takes effect.

The floating-point (FP) environment is a collection of registers that control the behavior of FP machine instructions and indicate the current FP status. The floating-point environment may include rounding-mode controls, exception masks, flush-to-zero controls, exception status flags, and other floating-point related features.
**Option**

- **-fp-model precise or /fp:precise**

  Tells the compiler to strictly adhere to value-safe optimizations when implementing floating-point calculations. It disables optimizations that can change the result of floating-point calculations, which is required for strict ANSI conformance.

  These semantics ensure the reproducibility of floating-point computations for serial code, including code vectorized or auto-parallelized by the compiler, but they may slow performance. They do not ensure value safety or run-to-run reproducibility of other parallel code. Run-to-run reproducibility for floating-point reductions in OpenMP* code may be obtained for a fixed number of threads through the KMP_DETERMINISTIC_REDUCTION environment variable. For more information about this environment variable, see topic "Supported Environment Variables".

  The compiler assumes the default floating-point environment; you are not allowed to modify it.

  Intermediate results are computed with the precision shown in the following table, unless it is overridden by a keyword from Group B:

<table>
<thead>
<tr>
<th></th>
<th>Windows</th>
<th>Linux</th>
<th>macOS*</th>
</tr>
</thead>
<tbody>
<tr>
<td>IA-32</td>
<td>Double</td>
<td></td>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Intel® 64</td>
<td>Source</td>
<td>Source</td>
<td>Source</td>
</tr>
<tr>
<td>architecture</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

  Floating-point exception semantics are disabled by default. To enable these semantics, you must also specify -fp-model except or /fp:except.

- **-fp-model fast[=1|2] or /fp:fast[=1|2]**

  Tells the compiler to use more aggressive optimizations when implementing floating-point calculations. These optimizations increase speed, but may affect the accuracy or reproducibility of floating-point computations.

  Specifying fast is the same as specifying fast=1. fast=2 may produce faster and less accurate results.

  Floating-point exception semantics are disabled by default and they cannot be enabled because you cannot specify fast and except together in the same compilation. To enable exception semantics, you must explicitly specify another keyword (see other keyword descriptions for details).
<table>

</tr>
</tbody>
</table>

- **-fp-model double or /fp:double**

This option causes intermediate results to be rounded as follows:
- 53-bit (double) precision
- 64-bit data type
- 11-bit exponent; on Windows systems using IA-32 architecture, the exponent may be 15-bit if an x87 register is used to hold the value.

This option also implies keyword `precise` unless it is overridden by a keyword from Group A.

The compiler assumes the default floating-point environment; you are not allowed to modify it.

- **-fp-model extended or /fp:extended**

This option causes intermediate results to be rounded as follows:
- 64-bit (extended) precision
- 80-bit data type
- 15-bit exponent

This option also implies keyword `precise` unless it is overridden by a keyword from Group A.

The compiler assumes the default floating-point environment; you are not allowed to modify it.

- **-fp-model except or /fp:except**

Tells the compiler to follow strict floating-point exception semantics.

The `-fp-model` and `/fp` options determine the setting for the maximum allowable relative error for math library function results (max-error) if none of the following options are specified:

- `-fimf-accuracy-bits (Linux* and macOS*)` or `/Qfimf-accuracy-bits (Windows*)`
- `-fimf-max-error (Linux and macOS*)` or `/Qfimf-max-error (Windows)`
- `-fimf-precision (Linux and macOS*)` or `/Qfimf-precision (Windows)`
- `[Q]fast-transcendentals`

**NOTE**
In Microsoft* Visual Studio, when you create a Microsoft* Visual C++ project, option /fp:precise is set by default. It sets the floating-point model to improve consistency for floating-point operations by disabling certain optimizations that may reduce performance. To set the option back to the general default /fp:fast, change the IDE project property for Floating Point Model to Fast.

---

**Optimization Notice**

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

**fp-port, Qfp-port**

*Rounds floating-point results after floating-point operations.*

### Syntax

**Linux OS and macOS:**

- `-fp-port`
- `-no-fp-port`

**Windows OS:**

- `/fp-port`
- `/Qfp-port`

### Arguments

None

### Default

- `-no-fp-port` or `/Qfp-port`

The default rounding behavior depends on the compiler's code generation decisions and the precision parameters of the operating system.

### Description

This option rounds floating-point results after floating-point operations.

This option is designed to be used with the `-mia32` (Linux*) or `/arch:IA32` (Windows*) option on a 32-bit compiler. Under those conditions, the compiler implements floating-point calculations using the x87 instruction set, which uses an internal precision that may be higher than the precision specified in the program.

By default, the compiler may keep results of floating-point operations in this higher internal precision. Rounding to program precision occurs at unspecified points. This provides better performance, but the floating-point results are less deterministic. The `[Q]fp-port` option rounds floating-point results to user-specified precision at assignments and type conversions. This has some impact on speed.

When compiling for newer architectures, the compiler implements floating-point calculations with different instructions, such as Intel® SSE and SSE2. These Intel® Streaming SIMD Extensions round directly to single precision or double precision at every instruction. In these cases, option `[Q]fp-port` has no effect.

### IDE Equivalent

**Visual Studio:**  *Optimization > Floating-point Precision Improvements*

**Eclipse:**  *Floating Point > Round Floating-Point Results*

**Xcode:**  *Floating Point > Round Floating-Point Results*

### Alternate Options

None

Understanding Floating-point Operations
**fp-speculation, Qfp-speculation**
*Tells the compiler the mode in which to speculate on floating-point operations.*

**Syntax**

**Linux OS and macOS:**

```
-fp-speculation=mode
```

**Windows OS:**

```
/Qfp-speculation:mode
```

**Arguments**

`mode` Is the mode for floating-point operations. Possible values are:

- **fast**
  Tells the compiler to speculate on floating-point operations.

- **safe**
  Tells the compiler to disable speculation if there is a possibility that the speculation may cause a floating-point exception.

- **strict**
  Tells the compiler to disable speculation on floating-point operations.

- **off**
  This is the same as specifying strict.

**Default**

```
-fp-speculation=fast
```

The compiler speculates on floating-point operations. This is also the behavior when optimizations are enabled. However, if you specify no optimizations (`-00` on Linux*; `/Od` on Windows*), the default is

```
-fp-speculation=safe (Linux*) or /Qfp-speculation:safe (Windows*)
```

**Description**

This option tells the compiler the mode in which to speculate on floating-point operations.

Disabling speculation may prevent the vectorization of some loops containing conditionals. For an example, see the article titled: *Diagnostic 15326: loop was not vectorized: implied FP exception model prevents vectorization*, which is located in https://software.intel.com/en-us/articles/fdiag15326.

**IDE Equivalent**

- Visual Studio: *Optimization > Floating-Point Speculation*
- Eclipse: *Floating Point > Floating-Point Speculation*
- Xcode: *Floating Point > Floating-Point Speculation*

**Alternate Options**

None
**fp-stack-check, Qfp-stack-check**
*Tells the compiler to generate extra code after every function call to ensure that the floating-point stack is in the expected state.*

**Syntax**

Linux OS and macOS:
- `-fp-stack-check`

Windows OS:
- `/Qfp-stack-check`

**Arguments**
None

**Default**
OFF

There is no checking to ensure that the floating-point (FP) stack is in the expected state.

**Description**
This option tells the compiler to generate extra code after every function call to ensure that the floating-point (FP) stack is in the expected state.

By default, there is no checking. So when the FP stack overflows, a NaN value is put into FP calculations and the program's results differ. Unfortunately, the overflow point can be far away from the point of the actual bug. This option places code that causes an access violation exception immediately after an incorrect call occurs, thus making it easier to locate these issues.

**IDE Equivalent**

Visual Studio: None
Eclipse: **Floating Point > Check Floating-point Stack**
Xcode: **Floating Point > Check Floating-point Stack**

**Alternate Options**
None

**fp-trap, Qfp-trap**
*Sets the floating-point trapping mode for the main routine.*

**Syntax**

Linux OS and macOS:
- `-fp-trap=mode[,mode,...]`

Windows OS:
- `/Qfp-trap:mode[,mode,...]`
Arguments

mode

Is the floating-point trapping mode. If you specify more than one mode value, the list is processed sequentially from left to right. Possible values are:

- [no]divzero: Enables or disables the IEEE trap for division by zero.
- [no]inexact: Enables or disables the IEEE trap for inexact result.
- [no]invalid: Enables or disables the IEEE trap for invalid operation.
- [no]overflow: Enables or disables the IEEE trap for overflow.
- [no]underflow: Enables or disables the IEEE trap for underflow.
- [no]denormal: Enables or disables the trap for denormal.
- all: Enables all of the above traps.
- none: Disables all of the above traps.
- common: Sets the most commonly used IEEE traps: division by zero, invalid operation, and overflow.

Default

- -fp-trap=none or /Qfp-trap:none

No traps are enabled when a program starts.

Description

This option sets the floating-point trapping mode for the main routine. It does not set a handler for floating-point exceptions.

The [no] form of a mode value is only used to modify the meaning of mode values all and common, and can only be used with one of those values. The [no] form of the option by itself does not explicitly cause a particular trap to be disabled.

Use mode value inexact with caution. This results in the trap being enabled whenever a floating-point value cannot be represented exactly, which can cause unexpected results.

If mode value underflow is specified, the compiler ignores the FTZ (flush-to-zero) bit state of Intel Streaming SIMD Extensions (Intel SSE) floating-point units.

When a DAZ (denormals are zero) bit is set in an Intel SSE floating-point unit control word, a denormal operand exception is never generated.

To set the floating-point trapping mode for all routines, specify the [Q]fp-trap-all option.

NOTE

The negative form of the [Q]ftz option can be used to set or reset the FTZ and the DAZ hardware flags.

IDE Equivalent

Visual Studio: Code Generation > Unmask Floating Point Exceptions
Configuration Properties->C/C++ > Unmask Floating Point Exceptions

Eclipse: Floating Point > Initial Exception Mask

Xcode: Floating Point > Set Initial Exception Mask

Alternate Options

None

See Also

ftz, Qftz compiler option
fp-trap-all, Qfp-trap-all compiler option

fp-trap-all, Qfp-trap-all

Sets the floating-point trapping mode for all routines.

Syntax

Linux OS and macOS:

-fp-trap-all=mode[,mode,...]

Windows OS:

/Qfp-trap-all:mode[,mode,...]

Arguments

mode

Is the floating-point trapping mode. If you specify more than one mode value, the list is processed sequentially from left to right. Possible values are:

(no)divzero

Enables or disables the IEEE trap for division by zero.

(no)inexact

Enables or disables the IEEE trap for inexact result.

(no)invalid

Enables or disables the IEEE trap for invalid operation.

(no)overflow

Enables or disables the IEEE trap for overflow.

(no)underflow

Enables or disables the IEEE trap for underflow.

(no)denormal

Enables or disables the trap for denormal.

all

Enables all of the above traps.

none

Disables all of the above traps.

common

Sets the most commonly used IEEE traps: division by zero, invalid operation, and overflow.

Default

-fp-trap-all=none

or/Qfp-trap-all:none

No traps are enabled for all routines.
Description
This option sets the floating-point trapping mode for the main routine. It does not set a handler for floating-point exceptions.
The [no] form of a mode value is only used to modify the meaning of mode values all and common, and can only be used with one of those values. The [no] form of the option by itself does not explicitly cause a particular trap to be disabled.
Use mode value inexact with caution. This results in the trap being enabled whenever a floating-point value cannot be represented exactly, which can cause unexpected results.
If mode value underflow is specified, the compiler ignores the FTZ (flush-to-zero) bit state of Intel® Streaming SIMD Extensions (Intel® SSE) floating-point units.
When a DAZ (denormals are zero) bit is set in an Intel® SSE floating-point unit control word, a denormal operand exception is never generated.
To set the floating-point trapping mode for the main routine only, specify the [Q]fp-trap option.

NOTE
The negative form of the [Q]ftz option can be used to set or reset the FTZ and the DAZ hardware flags.

IDE Equivalent
None

Alternate Options
None

See Also
ftz, Qftz compiler option
fp-trap, Qfp-trap compiler option

ftz, Qftz
Flushes denormal results to zero.

Syntax
Linux OS and macOS:
-ftz
-no-ftz

Windows OS:
/Qftz
/Qftz-

Arguments
None

Default
-ftz or /Qftz
Denormal results are flushed to zero.
Every optimization option \( O \) level, except \( O0 \), sets \([Q]\)ftz.

**Description**

This option flushes denormal results to zero when the application is in the gradual underflow mode. It may improve performance if the denormal values are not critical to your application’s behavior.

The \([Q]\)ftz option has no effect during compile-time optimization.

The \([Q]\)ftz option sets or resets the FTZ and the DAZ hardware flags. If FTZ is ON, denormal results from floating-point calculations will be set to the value zero. If FTZ is OFF, denormal results remain as is. If DAZ is ON, denormal values used as input to floating-point instructions will be treated as zero. If DAZ is OFF, denormal instruction inputs remain as is. Systems using Intel\(^\text{®}\) 64 architecture have both FTZ and DAZ. FTZ and DAZ are not supported on all IA-32 architectures.

When the \([Q]\)ftz option is used in combination with an SSE-enabling option on systems using IA-32 architecture (for example, the \([Q]\)xSSE2 option), the compiler will insert code in the main routine to set FTZ and DAZ. When \([Q]\)ftz is used without such an option, the compiler will insert code to conditionally set FTZ/DAZ based on a run-time processor check.

If you specify option \(-\text{no-ftz}\) (Linux and macOS\(^*\)) or option /Qftz- (Windows), it prevents the compiler from inserting any code that might set FTZ or DAZ.

Option \([Q]\)ftz only has an effect when the main program is being compiled. It sets the FTZ/DAZ mode for the process. The initial thread and any threads subsequently created by that process will operate in FTZ/DAZ mode.

If this option produces undesirable results of the numerical behavior of your program, you can turn the FTZ/DAZ mode off by specifying \(-\text{no-ftz} /Qftz-\) in the command line while still benefiting from the \( O3 \) optimizations.

**NOTE**

Option \([Q]\)ftz is a performance option. Setting this option does not guarantee that all denormals in a program are flushed to zero. The option only causes denormals generated at run time to be flushed to zero.

**IDE Equivalent**

Visual Studio: **Optimization > Flush Denormal Results to Zero**

Eclipse: **Floating-Point > Flush Denormal Results to Zero**

Xcode: **Floating-Point > Flush Denormal Results to Zero**

**Alternate Options**

None

**See Also**

\( x, \ Qx \) compiler option

Setting the FTZ and DAZ Flags

**Ge**

*Enables stack-checking for all functions. This is a deprecated option. The replacement option is /Gs0.*
**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
/Ge

**Arguments**
None

**Default**
OFF  
Stack-checking for all functions is disabled.

**Description**
This option enables stack-checking for all functions.

**IDE Equivalent**
None

**Alternate Options**
Linux and macOS*: None
Windows: /Gs0

**mp1, Qprec**
*Improves floating-point precision and consistency.*

**Syntax**

**Linux OS and macOS:**
-mp1

**Windows OS:**
/Qprec

**Arguments**
None

**Default**
OFF  
The compiler provides good accuracy and run-time performance at the expense of less consistent floating-point results.

**Description**
This option improves floating-point consistency. It ensures the out-of-range check of operands of transcendental functions and improves the accuracy of floating-point compares.

This option prevents the compiler from performing optimizations that change NaN comparison semantics and causes all values to be truncated to declared precision before they are used in comparisons. It also causes the compiler to use library routines that give better precision results compared to the X87 transcendental instructions.
This option disables fewer optimizations and has less impact on performance than option
-fp-model precise (Linux* and macOS*) or option /fp:precise (Windows*).

**IDE Equivalent**

Visual Studio: None
Eclipse: None
Xcode: **FloatingPoint > Improve Floating-Point Consistency**

**Alternate Options**

None

**See Also**

*pc, Qpc*

Enables control of floating-point significand precision.

**Syntax**

Linux OS and macOS:

- `pc n`

Windows OS:

/ Qpc n

**Arguments**

n

<table>
<thead>
<tr>
<th>n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>Rounds the significand to 24 bits (single precision).</td>
</tr>
<tr>
<td>64</td>
<td>Rounds the significand to 53 bits (double precision).</td>
</tr>
<tr>
<td>80</td>
<td>Rounds the significand to 64 bits (extended precision).</td>
</tr>
</tbody>
</table>

**Default**

- `pc80` or /Qpc64

On Linux* and macOS* systems, the floating-point significand is rounded to 64 bits. On Windows* systems, the floating-point significand is rounded to 53 bits.

**Description**

This option enables control of floating-point significand precision.

Some floating-point algorithms are sensitive to the accuracy of the significand, or fractional part of the floating-point value. For example, iterative operations like division and finding the square root can run faster if you lower the precision with the this option.

Note that a change of the default precision control or rounding mode, for example, by using the [Q]pc32 option or by user intervention, may affect the results returned by some of the mathematical functions.

**IDE Equivalent**

None
Alternate Options
None

prec-div, Qprec-div
*Improves precision of floating-point divides.*

Syntax
Linux OS and macOS:
-prec-div
-no-prec-div

Windows OS:
/Qprec-div
/Qprec-div-

Arguments
None

Default
OFF

Default heuristics are used. The default is not as accurate as full IEEE division, but it is slightly more accurate than would be obtained when /Qprec-div- or -no-prec-div is specified.

If you need full IEEE precision for division, you should specify [Q]prec-div.

Description
This option improves precision of floating-point divides. It has a slight impact on speed.

At default optimization levels, the compiler may change floating-point division computations into multiplication by the reciprocal of the denominator. For example, A/B is computed as A * (1/B) to improve the speed of the computation.

However, sometimes the value produced by this transformation is not as accurate as full IEEE division. When it is important to have fully precise IEEE division, use this option to disable the floating-point division-to-multiplication optimization. The result is more accurate, with some loss of performance.

If you specify -no-prec-div (Linux* and macOS*) or /Qprec-div- (Windows*), it enables optimizations that give slightly less precise results than full IEEE division.

Option [Q]prec-div is implied by option -fp-model precise (Linux* and macOS*) and option /fp:precise (Windows*).

IDE Equivalent
None

Alternate Options
None

See Also
fp-model, fp compiler option
**prec-sqrt, Qprec-sqrt**  
*Improves precision of square root implementations.*  

**Syntax**  

**Linux OS and macOS:**  
-prec-sqrt  
-no-prec-sqrt  

**Windows OS:**  
/Qprec-sqrt  
/Qprec-sqrt-  

**Arguments**  
None  

**Default**  
-no-prec-sqrt  
or /Qprec-sqrt-  

The compiler uses a faster but less precise implementation of square root. However, the default is -prec-sqrt or /Qprec-sqrt if any of the following options are specified: /Od, /fp:precise, or /Qprec on Windows* systems; -O0 or -mp1 on Linux* and macOS* systems.  

**Description**  
This option improves precision of square root implementations. It has a slight impact on speed.  
This option inhibits any optimizations that can adversely affect the precision of a square root computation. The result is fully precise square root implementations, with some loss of performance.  

**IDE Equivalent**  
None  

**Alternate Options**  
None  

**qsimd-honor-fp-model, Qsimd-honor-fp-model**  
*Tells the compiler to obey the selected floating-point model when vectorizing SIMD loops.*  

**Syntax**  

**Linux OS and macOS:**  
-qsimd-honor-fp-model  
-qno-simd-honor-fp-model  

**Windows OS:**  
/Qsimd-honor-fp-model  
/Qsimd-honor-fp-model-  

Intel® C++ Compiler 19.0 Developer Guide and Reference

342
Arguments
None

Default

-qno-simd-honor-fp-model or /Qsimd-honor-fp-model
The compiler performs vectorization of SIMD loops even if it breaks the floating-point model setting.

Description
The OpenMP* SIMD specification and the setting of compiler option -fp-model (Linux* and macOS*) or /fp (Windows*) can contradict in requirements. When contradiction occurs, the default behavior of the compiler is to follow the OpenMP* specification and therefore vectorize the loop.

This option lets you override this default behavior - it causes the compiler to follow the -fp-model (or /fp) specification. This means that the compiler will serialize the loop.

NOTE
This option does not affect automatic vectorization of loops. By default, the compiler uses -fp-model (Linux* and macOS*) or /fp (Windows*) settings for this.

IDE Equivalent
None

Alternate Options
None

See Also
qsimd-serialize-fp-reduction, Qsimd-serialize-fp-reduction compiler option
fp-model, fp compiler option
simd pragma
qsimd-serialize-fp-reduction, Qsimd-serialize-fp-reduction
Tells the compiler to serialize floating-point reduction when vectorizing SIMD loops.

Syntax

Linux OS and macOS:
-qsimd-serialize-fp-reduction
-qno-simd-serialize-fp-reduction

Windows OS:
/Qsimd-serialize-fp-reduction
/Qsimd-serialize-fp-reduction-

Arguments
None
Default

-qno-simd-serialize-fp-reduction or /Qsimd-serialize-fp-reduction

The compiler does not attempt to serialize floating-point reduction in SIMD loops.

Description

The OpenMP* SIMD reduction specification and the setting of compiler option -fp-model (Linux* and macOS*) or /fp (Windows*) can contradict in requirements. When contradiction occurs, the default behavior of the compiler is to follow OpenMP* specification and therefore vectorize the loop, including floating-point reduction.

This option lets you override this default behavior - it causes the compiler to follow the -fp-model (or /fp) specification. This means that the compiler will serialize the floating-point reduction while vectorizing the rest of the loop.

NOTE
When [q or Q]simd-honor-fp-model is specified and OpenMP* SIMD reduction specification is the only thing causing serialization of the entire loop, addition of option [q or Q]simd-serialize-fp-reduction will result in vectorization of the entire loop except for reduction calculation, which will be serialized.

NOTE
This option does not affect automatic vectorization of loops. By default, the compiler uses -fp-model (Linux* and macOS*) or /fp (Windows*) settings for this.

IDE Equivalent

None

Alternate Options

None

qsimd-honor-fp-model, Qsimd-honor-fp-model compiler option
fp-model, fp compiler option
simd pragma

rcd, Qrcd

Enables fast float-to-integer conversions. This is a deprecated option. There is no replacement option.

Syntax

Linux OS and macOS:

-rcd

Windows OS:

/Qrcd
Arguments
None

Default
OFF

Floating-point values are truncated when a conversion to an integer is involved.

Description
This option enables fast float-to-integer conversions. It can improve the performance of code that requires floating-point-to-integer conversions.

The system default floating-point rounding mode is round-to-nearest. However, the C language requires floating-point values to be truncated when a conversion to an integer is involved. To do this, the compiler must change the rounding mode to truncation before each floating-point-to-integer conversion and change it back afterwards.

This option disables the change to truncation of the rounding mode for all floating-point calculations, including floating point-to-integer conversions. This option can improve performance, but floating-point conversions to integer will not conform to C semantics.

IDE Equivalent
None

Alternate Options
Linux and macOS*: None
Windows: /QIfist (this is a deprecated option)

Inlining Options
fgnu89-inline
_Tells the compiler to use C89 semantics for inline functions when in C99 mode._

Syntax

Linux OS and macOS:
- fgnu89-inline

Windows OS:
None

Arguments
None

Default
OFF

Description
This option tells the compiler to use C89 semantics for inline functions when in C99 mode.
**IDE Equivalent**
None

**Alternate Options**
None

**finline**
*Tells the compiler to inline functions declared with \_\_inline and perform C++ inlining.*

**Syntax**

**Linux OS and macOS:**
- `-finline`
- `-fno-inline`

**Windows OS:**
None

**Arguments**
None

**Default**
- `-fno-inline`  
  The compiler does not inline functions declared with \_\_inline.

**Description**
This option tells the compiler to inline functions declared with \_\_inline and perform C++ inlining.

**IDE Equivalent**
None

**Alternate Options**

**Linux and macOS:** `-inline-level`

**Windows:** `/Ob`

**finline-functions**
*Enables function inlining for single file compilation.*

**Syntax**

**Linux OS and macOS:**
- `-finline-functions`
- `-fno-inline-functions`

**Windows OS:**
None

**Arguments**
None
Default

-finline-functions Interprocedural optimizations occur. However, if you specify -O0, the default is OFF.

Description
This option enables function inlining for single file compilation. It enables the compiler to perform inline function expansion for calls to functions defined within the current source file.
The compiler applies a heuristic to perform the function expansion. To specify the size of the function to be expanded, use the -finline-limit option.

IDE Equivalent
None

Alternate Options
Linux and macOS*: -inline-level=2
Windows: /Ob2

See Also
ip, Qip compiler option
finline-limit compiler option

finline-limit
Lets you specify the maximum size of a function to be inlined.

Syntax
Linux OS and macOS:
-finline-limit=n

Windows OS:
None

Arguments
n Must be an integer greater than or equal to zero. It is the maximum number of lines the function can have to be considered for inlining.

Default
OFF The compiler uses default heuristics when inlining functions.

Description
This option lets you specify the maximum size of a function to be inlined. The compiler inlines smaller functions, but this option lets you inline large functions. For example, to indicate a large function, you could specify 100 or 1000 for n.
Note that parts of functions cannot be inlined, only whole functions.
This option is a modification of the -finline-functions option, whose behavior occurs by default.
IDE Equivalent
None

Alternate Options
None

See Also

inline-calloc, Qinline-calloc
_Tells the compiler to inline calls to calloc() as calls to malloc() and memset._

Architectures
All

Syntax

Linux OS and macOS:
- -inline-calloc
- -no-inline-calloc

Windows OS:
/Qinline-calloc
/Qinline-calloc-

Arguments
None

Default
- -no-inline-calloc
or/Qinline-calloc-

Description
This option tells the compiler to inline calls to calloc() as calls to malloc() and memset(). This enables additional memset() optimizations. For example, it can enable inlining as a sequence of store operations when the size is a compile time constant.

**NOTE**
Many routines in the supplied libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors

<table>
<thead>
<tr>
<th>Optimization Notice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain</td>
</tr>
</tbody>
</table>
inline-factor, Qinline-factor

Specifies the percentage multiplier that should be applied to all inlining options that define upper limits.

Syntax

Linux OS and macOS:

- `inline-factor=n`
- `no-inline-factor`

Windows OS:

/Qinline-factor:n
/Qinline-factor-

Arguments

`n` is a positive integer specifying the percentage value. The default value is 100 (a factor of 1).

Default

- `inline-factor=100` or `Qinline-factor:100`

The compiler uses a percentage multiplier of 100.

Description

This option specifies the percentage multiplier that should be applied to all inlining options that define upper limits:

- `[Q]inline-max-size`
- `[Q]inline-max-total-size`
- `[Q]inline-max-per-routine`
- `[Q]inline-max-per-compile`

The `[Q]inline-factor` option takes the default value for each of the above options and multiplies it by `n` divided by 100. For example, if 200 is specified, all inlining options that define upper limits are multiplied by a factor of 2. This option is useful if you do not want to individually increase each option limit.

If you specify `-no-inline-factor` (Linux* and macOS*) or `/Qinline-factor-` (Windows*), the following occurs:
Every function is considered to be a small or medium function; there are no large functions.
There is no limit to the size a routine may grow when inline expansion is performed.
There is no limit to the number of times some routine may be inlined into a particular routine.
There is no limit to the number of times inlining can be applied to a compilation unit.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

**Caution**
When you use this option to increase default limits, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
- `inline-max-size`, `Qinline-max-size` compiler option
- `inline-max-total-size`, `Qinline-max-total-size` compiler option
- `inline-max-per-routine`, `Qinline-max-per-routine` compiler option
- `inline-max-per-compile`, `Qinline-max-per-compile` compiler option
- `qopt-report`, `Qopt-report` compiler option

**inline-forceinline, Qinline-forceinline**
*Instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.*

**Syntax**

**Linux OS and macOS:**
- `-inline-forceinline`

**Windows OS:**
- `/Qinline-forceinline`

**Default**
OFF

The compiler uses default heuristics for inline routine expansion.

**Description**
This option instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.

Without this option, the compiler treats functions declared with the inline keyword as merely being recommended for inlining. When this option is used, it is as if they were declared with the keyword `__forceinline` keyword.
NOTE
Because C++ member functions whose definitions are included in the class declaration are considered inline functions by default, using this option will also make these member functions "forceinline" functions.

To see compiler values for important inlining limits, specify option [q or Q]opt-report.

Caution
When you use this option to change the meaning of inline to "forceinline", the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent
None

Alternate Options
None

See Also
qopt-report, Qopt-report compiler option

inline-level, Ob
Specifies the level of inline function expansion.

Syntax
Linux OS and macOS:
  -inline-level=n
Windows OS:
  /Obn

Arguments
n
  Is the inline function expansion level. Possible values are 0, 1, and 2.

Default
-inline-level=2 or /Ob2
  This is the default if option O2 is specified or is in effect by default. On Windows* systems, this is also the default if option O3 is specified.
-inline-level=0 or /Ob0
  This is the default if option -O0 (Linux* and macOS*) or /Od (Windows*) is specified.

Description
This option specifies the level of inline function expansion. Inlining procedures can greatly improve the run-time performance of certain programs.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-inline-level=0 or /Ob0</td>
<td>Disables inlining of user-defined functions. Note that statement functions are always inlined.</td>
</tr>
<tr>
<td>-inline-level=1 or /Ob1</td>
<td>Enables inlining when an inline keyword or an inline attribute is specified. Also enables inlining according to the C++ language.</td>
</tr>
<tr>
<td>-inline-level=2 or /Ob2</td>
<td>Enables inlining of any function at the compiler's discretion.</td>
</tr>
</tbody>
</table>

**IDE Equivalent**

Visual Studio: **Optimization > Inline Function Expansion**

Eclipse: **Optimization > Inline Function Expansion**

Xcode: **Optimization > Inline Function Expansion**

**Alternate Options**

None

**inline-max-per-compile, Qinline-max-per-compile**

Specifies the maximum number of times inlining may be applied to an entire compilation unit.

**Syntax**

**Linux OS and macOS:**

- inline-max-per-compile=n
- no-inline-max-per-compile

**Windows OS:**

/Qinline-max-per-compile=n
/Qinline-max-per-compile-

**Arguments**

\( n \)

Is a positive integer that specifies the number of times inlining may be applied.

**Default**

-no-inline-max-per-compile The compiler uses default heuristics for inline routine expansion.

or

/Qinline-max-per-compile-

**Description**

This option the maximum number of times inlining may be applied to an entire compilation unit. It limits the number of times that inlining can be applied.

For compilations using Interprocedural Optimizations (IPO), the entire compilation is a compilation unit. For other compilations, a compilation unit is a file.

If you specify -no-inline-max-per-compile (Linux* and macOS*) or /Qinline-max-per-compile- (Windows*), there is no limit to the number of times inlining may be applied to a compilation unit.

To see compiler values for important inlining limits, specify option [q or Q]opt-report.
**Caution**
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
inline-factor, Qinline-factor compiler option

**inline-max-per-routine, Qinline-max-per-routine**
Specifies the maximum number of times the inliner may inline into a particular routine.

**Syntax**

**Linux OS and macOS:**
- -inline-max-per-routine=\textit{n}
- -no-inline-max-per-routine

**Windows OS:**
/\textit{Qinline-max-per-routine=\textit{n}}
/\textit{Qinline-max-per-routine-}

**Arguments**

\textit{n}
Is a positive integer that specifies the maximum number of times the inliner may inline into a particular routine.

**Default**

- -no-inline-max-per-routine The compiler uses default heuristics for inline routine expansion.
  or
  /\textit{Qinline-max-per-routine-}

**Description**
This option specifies the maximum number of times the inliner may inline into a particular routine. It limits the number of times that inlining can be applied to any routine.

If you specify **-no-inline-max-per-routine (Linux* and macOS*) or /\textit{Qinline-max-per-routine-} (Windows*), there is no limit to the number of times some routine may be inlined into a particular routine.

To see compiler values for important inlining limits, specify option [q or Q]opt-report.
Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent
None

Alternate Options
None

See Also
inline-factor, Qinline-factor compiler option
qopt-report, Qopt-report compiler option

**inline-max-size, Qinline-max-size**
Specifies the lower limit for the size of what the inliner considers to be a large routine.

Syntax

**Linux OS and macOS:**
-inline-max-size=n
-no-inline-max-size

**Windows OS:**
/Qinline-max-size=n
/Qinline-max-size-

Arguments

n Is a positive integer that specifies the minimum size of what the inliner considers to be a large routine.

Default

-inline-max-size
or /Qinline-max-size

The compiler sets the maximum size (n) dynamically, based on the platform.

Description

This option specifies the lower limit for the size of what the inliner considers to be a large routine (a function). The inliner classifies routines as small, medium, or large. This option specifies the boundary between what the inliner considers to be medium and large-size routines.

The inliner prefers to inline small routines. It has a preference against inlining large routines. So, any large routine is highly unlikely to be inlined.

If you specify -no-inline-max-size (Linux* and macOS*) or /Qinline-max-size- (Windows*), there are no large routines. Every routine is either a small or medium routine.

To see compiler values for important inlining limits, specify option [q or Q]opt-report.
Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent
None

Alternate Options
None

See Also
inline-min-size, Qinline-min-size compiler option
inline-factor, Qinline-factor compiler option
qopt-report, Qopt-report compiler option

inline-max-total-size, Qinline-max-total-size
Specifies how much larger a routine can normally grow when inline expansion is performed.

Syntax
Linux OS and macOS:
-inline-max-total-size=n
-no-inline-max-total-size

Windows OS:
/Qinline-max-total-size=n
/Qinline-max-total-size-

Arguments
n  Is a positive integer that specifies the permitted increase in the routine's size when inline expansion is performed.

Default
-no-inline-max-total-size  The compiler uses default heuristics for inline routine expansion.
or/Qinline-max-total-size-

Description
This option specifies how much larger a routine can normally grow when inline expansion is performed. It limits the potential size of the routine. For example, if 2000 is specified for n, the size of any routine will normally not increase by more than 2000.

If you specify -no-inline-max-total-size (Linux* and macOS*) or /Qinline-max-total-size- (Windows*), there is no limit to the size a routine may grow when inline expansion is performed.

To see compiler values for important inlining limits, specify option [q or Q]opt-report.
Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent
None

Alternate Options
None

See Also
inline-factor, Qinline-factor compiler option
gopect-report, Qopt-report compiler option

inline-min-caller-growth, Qinline-min-caller-growth
Lets you specify a function size \( n \) for which functions of size \( \leq n \) do not contribute to the estimated growth of the caller when inlined.

Syntax
Linux OS and macOS:
- \(-\text{inline-min-caller-growth}=n\)

Windows OS:
/\Qinline-min-caller-growth=n

Arguments
\( n \)
Is a non-negative integer. When \( n > 0 \), functions with a size of \( n \) are treated as if they are size 0.

Default
- \(-\text{inline-min-caller-growth}=0\)
The compiler treats functions as if they have size zero.
or
/\Qinline-min-caller-growth=0

Description
This option lets you specify a function size \( n \) for which functions of size \( \leq n \) do not contribute to the estimated growth of the caller when inlined. It allows you to inline functions that the compiler would otherwise consider too large to inline.

NOTE
We recommend that you choose a value of \( n \leq 10 \); otherwise, compile time and code size may greatly increase.

IDE Equivalent
None
Alternate Options

None

**inline-min-size, Qinline-min-size**

Specifies the upper limit for the size of what the inliner considers to be a small routine.

**Syntax**

**Linux OS and macOS:**

- `-inline-min-size=n`
- `-no-inline-min-size`

**Windows OS:**

- `/Qinline-min-size=n`
- `/Qinline-min-size-`

**Arguments**

**n**

Is a positive integer that specifies the maximum size of what the inliner considers to be a small routine.

**Default**

- `-no-inline-min-size`
  - The compiler uses default heuristics for inline routine expansion.
  - or `/Qinline-min-size-`

**Description**

This option specifies the upper limit for the size of what the inliner considers to be a small routine (a function). The inliner classifies routines as small, medium, or large. This option specifies the boundary between what the inliner considers to be small and medium-size routines.

The inliner has a preference to inline small routines. So, when a routine is smaller than or equal to the specified size, it is very likely to be inlined.

If you specify `-no-inline-min-size (Linux* and macOS*)` or `/Qinline-min-size- (Windows*)`, there is no limit to the size of small routines. Every routine is a small routine; there are no medium or large routines.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

---

**Caution**

When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

---

**IDE Equivalent**

None

**Alternate Options**

None

Qinline-dllimport
Determines whether dllimport functions are inlined.

Syntax

Linux OS and macOS:
None

Windows OS:
/Qinline-dllimport
/Qinline-dllimport-

Arguments
None

Default
/Qinline-dllimport

The dllimport functions are inlined.

Description
This option determines whether dllimport functions are inlined. To disable dllimport functions from being inlined, specify /Qinline-dllimport-.

IDE Equivalent
None

Alternate Options
None

Output, Debug, and Precompiled Header (PCH) Options

c
Prevents linking.

Syntax

Linux OS and macOS:
-<c>

Windows OS:
/\c

Arguments
None
Default

OFF

Linking is performed.

Description

This option prevents linking. Compilation stops after the object file is generated.

The compiler generates an object file for each C or C++ source file or preprocessed source file. It also takes an assembler file and invokes the assembler to generate an object file.

IDE Equivalent

None

Alternate Options

None

deb ug (Linux* and macOS*)

Enables or disables generation of debugging information.

Syntax

Linux OS and macOS:

- `debug {keyword}`

Windows OS:

None

Arguments

`keyword`

Is the type of debugging information to be generated. Possible values are:

- `none`
  - Disables generation of debugging information.
- `full` or `all`
  - Generates complete debugging information.
- `minimal`
  - Generates line number information for debugging.
- `[no]emit_column`
  - Determines whether the compiler generates column number information for debugging.
- `[no]expr-source-pos`
  - Determines whether the compiler generates source position information at the expression level of granularity.
- `[no]inline-debug-info`
  - Determines whether the compiler generates enhanced debug information for inlined code.
- `[no]pubnames`
  - Determines whether the compiler generates a DWARF debug_pubnames section.
- `[no]semantic-stepping`
  - Determines whether the compiler generates enhanced debug information useful for breakpoints and stepping.
Variable Locations

Determines whether the compiler generates enhanced debug information useful in finding scalar local variables.

Extended

Generates complete debugging information and also sets keyword values semantic-stepping and variable-locations.

Parallel (Linux only)

Determines whether the compiler generates parallel debug code instrumentations useful for thread data sharing and reentrant call detection.

For information on the non-default settings for these keywords, see the Description section.

Default

Varies

Normally, the default is `-debug none` and no debugging information is generated. However, on Linux*, the `-debug inline-debug-info` option will be enabled by default if you compile with optimizations (option `-O2` or higher) and debugging is enabled (option `-g`).

Description

This option enables or disables generation of debugging information.

By default, enabling debugging, will disable optimization. To enable both debugging and optimization use the `-debug` option together with one of the optimization level options (`-O3`, `-O2` or `-O3`).

Keywords semantic-stepping, inline-debug-info, variable-locations, and extended can be used in combination with each other. If conflicting keywords are used in combination, the last one specified on the command line has precedence.

<table>
<thead>
<tr>
<th>Option</th>

</tr>
</thead>
<tbody>
<tr>
<td><code>-debug none</code></td>
<td>Disables generation of debugging information.</td>
</tr>
<tr>
<td><code>-debug full</code> or <code>-debug all</code></td>
<td>Generates complete debugging information. It is the same as specifying <code>-debug</code> with no keyword.</td>
</tr>
<tr>
<td><code>-debug minimal</code></td>
<td>Generates line number information for debugging.</td>
</tr>
<tr>
<td><code>-debug emit_column</code></td>
<td>Generates column number information for debugging.</td>
</tr>
<tr>
<td><code>-debug expr-source-pos</code></td>
<td>Generates source position information at the statement level of granularity.</td>
</tr>
<tr>
<td><code>-debug inline-debug-info</code></td>
<td>Generates enhanced debug information for inlined code.</td>
</tr>
<tr>
<td></td>
<td>On inlined functions, symbols are (by default) associated with the caller.</td>
</tr>
<tr>
<td></td>
<td>This option causes symbols for inlined functions to be associated with the</td>
</tr>
<tr>
<td></td>
<td>source of the called function.</td>
</tr>
<tr>
<td><code>-debug pubnames</code></td>
<td>The compiler generates a DWARF debug_pubnames section. This provides a</td>
</tr>
<tr>
<td></td>
<td>means to list the names of global objects and functions in a compilation</td>
</tr>
<tr>
<td></td>
<td>unit.</td>
</tr>
<tr>
<td><code>-debug semantic-stepping</code></td>
<td>Generates enhanced debug information useful for breakpoints and stepping.</td>
</tr>
<tr>
<td></td>
<td>It tells the debugger to stop only at machine instructions that achieve the</td>
</tr>
<tr>
<td></td>
<td>final effect of a source statement.</td>
</tr>
</tbody>
</table>
### Option Description

For example, in the case of an assignment statement, this might be a store instruction that assigns a value to a program variable; for a function call, it might be the machine instruction that executes the call. Other instructions generated for those source statements are not displayed during stepping.

This option has no impact unless optimizations have also been enabled.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-debug variable-locations</td>
<td>Generates enhanced debug information useful in finding scalar local variables. It uses a feature of the Dwarf object module known as &quot;location lists&quot;. This feature allows the run-time locations of local scalar variables to be specified more accurately; that is, whether, at a given position in the code, a variable value is found in memory or a machine register.</td>
</tr>
<tr>
<td>-debug extended</td>
<td>Sets keyword values semantic-stepping and variable-locations. It also tells the compiler to include column numbers in the line information. Generates complete debugging information and also sets keyword values semantic-stepping and variable-locations. This is a more powerful setting than -debug full or -debug all.</td>
</tr>
<tr>
<td>-debug parallel</td>
<td>Generates parallel debug code instrumentations needed for the thread data sharing and reentrant call detection. For shared data and reentrancy detection, option -qopenmp must be set.</td>
</tr>
</tbody>
</table>

On Linux* systems, debuggers read debug information from executable images. As a result, information is written to object files and then added to the executable by the linker.

On macOS* systems, debuggers read debug information from object files. As a result, the executables don't contain any debug information. Therefore, if you want to be able to debug on these systems, you must retain the object files.

### IDE Equivalent

**Visual Studio:** None

<td>Determines whether the compiler generates source position information at the expression level of granularity.</td>
</tr>
<tr>
<td>[no]inline-debug-info</td>
<td>Determines whether the compiler generates enhanced debug information for inlined code.</td>
</tr>
</tbody>
</table>

For information on the non-default settings for these keywords, see the Description section.

Default

/debug:none
This is the default on the command line and for a release configuration in the IDE.

/debug:all
This is the default for a debug configuration in the IDE.

Description
This option enables or disables generation of debugging information. It is passed to the linker.

By default, enabling debugging, will disable optimization. To enable both debugging and optimization use the /debug option together with one of the optimization level options (/O3, /O2 or /O3).

If conflicting keywords are used in combination, the last one specified on the command line has precedence.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/debug:none</td>
<td>Disables generation of debugging information.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
/debug:full or /debug:all | Generates complete debugging information. It produces symbol table information needed for full symbolic debugging of unoptimized code and global symbol information needed for linking. It is the same as specifying `/debug` with no keyword.
/debug: minimal | Generates line number information for debugging.
/debug: partial | Generates global symbol table information needed for linking, but not local symbol table information needed for debugging. This option is deprecated and is not available in the IDE.
/debug: expr-source-pos | Generates source position information at the statement level of granularity.
/debug: inline-debug-info | Generates enhanced debug information for inlined code.

On inlined functions, symbols are (by default) associated with the caller. This option causes symbols for inlined functions to be associated with the source of the called function.

**IDE Equivalent**

Visual Studio: **Debugging > Enable Expanded Line Number Information** (`/debug:expr-source-pos`)

Eclipse: None

Xcode: None

**Alternate Options**

**Fa**

Specifies that an assembly listing file should be generated.

**Syntax**

**Linux OS and macOS:**

```
-Fa[filename|dir]
```

**Windows OS:**

```
/Fa[filename|dir]
```

**Arguments**

`filename` is the name of the assembly listing file.
**dir**

Is the directory where the file should be placed. It can include `filename`.

**Default**

OFF

No assembly listing file is produced.

**Description**

This option specifies that an assembly listing file should be generated (optionally named `filename`).

**IDE Equivalent**

Visual Studio: **Output Files > ASM List Location**

Eclipse: **Output > Generate Assembler Source and Binary Files**

Xcode: **Output Files > Filename for Generated Assembler Listing, Output > Generate Assembler Listing**

</tbody>
</table>

**fasm-blocks**

*Enables the use of blocks and entire functions of assembly code within a C or C++ file.*

**Syntax**

**Linux OS and macOS:**

-fasm-blocks

**Windows OS:**

None

**Arguments**

None

**Default**

OFF The compiler allows a GNU*-style inline assembly format.

**Description**

This option enables the use of blocks and entire functions of assembly code within a C or C++ file. It allows a Microsoft* MASM-style inline assembly block not a GNU*-style inline assembly block. On macOS* systems, this option is provided for compatibility with the Apple* GNU compiler.

**IDE Equivalent**

None
Alternate Options

-use-msasm

**FC**

*Displays the full path of source files passed to the compiler in diagnostics.*

**Syntax**

*Linux OS and macOS:*

None

*Windows OS:*

/FC

**Arguments**

None

**Default**

OFF

The compiler does not display the full path of source files passed to the compiler in diagnostics.

**Description**

Displays the full path of source files passed to the compiler in diagnostics. This option is supported with Microsoft Visual Studio.NET 2003* or newer.

**IDE Equivalent**

Visual Studio: **Advanced > Use Full Paths**

Alternate Options

None

**fcode-asm**

*Produces an assembly listing with machine code annotations.*

**Syntax**

*Linux OS and macOS:*

-fcode-asm

*Windows OS:*

None

**Arguments**

None
Default

OFF

No machine code annotations appear in the assembly listing file, if one is produced.

Description

This option produces an assembly listing file with machine code annotations.

The assembly listing file shows the hex machine instructions at the beginning of each line of assembly code. The file cannot be assembled; the file name is the name of the source file with an extension of .cod.

To use this option, you must also specify option -S, which causes an assembly listing to be generated.

IDE Equivalent

None

Alternate Options

Linux and macOS*: None

Windows: /FAc

See Also

S compiler option

Fd

Lets you specify a name for a program database (PDB) file created by the compiler.

Syntax

Linux OS and macOS:
None

Windows OS:
/Fd[:filename]

Arguments

filename

Is the name for the PDB file. It can include a path. If you do not specify a file extension, the extension .pdb is used.

Default

OFF

No PDB file is created unless you specify option /zi. If you specify option /zi and /Fd, the default filename is vcx0.pdb, where x represents the version of Visual C++, for example vc100.pdb.

Description

This option lets you specify a name for a program database (PDB) file that is created by the compiler.

A program database (PDB) file holds debugging and project state information that allows incremental linking of a Debug configuration of your program. A PDB file is created when you build with option /zi. Option /Fd has no effect unless you specify option /zi.
IDE Equivalent
Visual Studio: **Output Files > Program Database File Name**
Eclipse: None
Xcode: None

Alternate Options
None

pdbfile compiler option

FD
*Generates file dependencies related to the Microsoft* C/C++ *compiler.*

**Syntax**

Linux OS and macOS:
None

Windows OS:
/\FD

**Arguments**
None

**Default**
OFF

The compiler does not generate Microsoft C/C++-related file dependencies.

**Description**
This option generates file dependencies related to the Microsoft C/C++ compiler. It invokes the Microsoft C/C++ compiler and passes the option to it.

IDE Equivalent
None

Alternate Options
None

Fe
*Specifies the name for a built program or dynamic-link library.*

**Syntax**

Linux OS and macOS:
None
Windows OS:
/Fe[[:\]filename|dir]

Arguments

filename Is the name for the built program or dynamic-link library.

dir Is the directory where the built program or dynamic-link library should be placed. It can include file.

Default
OFF

The name of the file is the name of the first source file on the command line with file extension .exe, so file.f becomes file.exe.

Description
This option specifies the name for a built program (.EXE) or a dynamic-link library (.DLL).

You can use this option to specify an alternate name for an executable file. This is especially useful when compiling and linking a set of input files. You can use the option to give the resulting file a name other than that of the first input file (source or object) on the command line.

IDE Equivalent
None

Alternate Options

Linux and macOS*: –o

Windows: None

Example

In the following example, the command produces an executable file named outfile.exe as a result of compiling and linking three files: one object file and two C++ source files.

prompt> icl /Feoutfile.exe file1.obj file2.cpp file3.cpp

By default, this command produces an executable file named file1.exe.

© compiler option

felimate-unused-debug-types, Qeliminate-unused-debug-types

Controls the debug information emitted for types declared in a compilation unit.

Syntax

Linux OS and macOS:
-feliminate-unused-debug-types
-fno-eliminate-unused-debug-types

Windows OS:
/Qeliminate-unused-debug-types
/Qeliminate-unused-debug-types-
Arguments
None

Default
-feliminate-unused-debug-types or /Qeliminate-unused-debug-types

Description
The compiler emits debug information only for types that are actually used by a variable/parameter/etc..

This option controls the debug information emitted for types declared in a compilation unit.

If you specify -fno-eliminate-unused-debug-types (Linux and macOS*) or /Qeliminate-unused-debug-types-, it will cause the compiler to emit debug information for all types present in the sources. This option may cause a large increase in the size of the debug information.

IDE Equivalent
None

Alternate Options
None

femit-class-debug-always
Controls the format and size of debug information generated by the compiler for C++ classes.

Syntax
Linux OS:
-femit-class-debug-always
-fno-emit-class-debug-always

macOS:
None

Windows OS:
None

Arguments
None

Default
-fno-emit-class-debug-always

Description
Causes the compiler to reduce the amount of debug information generated for C++ classes.

When emission of debug information is enabled, this option will control the format and size of debug information generated by the compiler for C++ classes. It tells the compiler to generate full debug information, or it tells the compiler to reduce the amount of debug information it generates.
When you specify the `-femit-class-debug-always` option, the compiler emits debug information for a C++ class into each object file where the class is used. This option is useful for tools that are not able to resolve incomplete type descriptions. Note that this option may cause a large increase in the size of the debug information generated.

When you specify the `-fno-emit-class-debug-always` option, the compiler does not emit full debug information for every instance of C++ class use. In general, this reduces the size of the debugging information generated for C++ applications without impacting debugging ability when used with debuggers that have corresponding support, such as gdb.

**IDE Equivalent**

None

**Alternate Options**

None

**fmerge-constants**

_Determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units._

**Syntax**

Linux OS:

- `-fmerge-constants`
- `-fno-merge-constants`

macOS:

None

Windows OS:

None

**Arguments**

None

**Default**

- `-fmerge-constants`

  The compiler and linker attempt to merge identical constants across compilation units if the compiler and linker supports it.

**Description**

This option determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units.

If you do not want the compiler and linker to attempt to merge identical constants across compilation units, specify `-fno-merge-constants`.

**IDE Equivalent**

None

**Alternate Options**

None
fmerge-debug-strings
Causes the compiler to pool strings used in debugging information.

Syntax
Linux OS:
-fmerge-debug-strings
-fno-merge-debug-strings
macOS:
None
Windows OS:
None

Arguments
None

Default
-fmerge-debug-strings
The compiler will pool strings used in debugging information.

Description
This option causes the compiler to pool strings used in debugging information. The linker will automatically retain this pooling.

This option can reduce the size of debug information, but it may produce slightly slower compile and link times.

This option is only turned on by default if you are using gcc 4.3 or later, where this setting is also the default, since the generated debug tables require binutils version 2.17 or later to work reliably.

If you do not want the compiler to pool strings used in debugging information, specify option -fno-merge-debug-strings.

IDE Equivalent
None

Alternate Options
None

Fo
Specifies the name for an object file.

Syntax
Linux OS and macOS:
See option o.
Windows OS:
/Fo[:]filename|dir

Specifies the name for an object file.
Arguments

_filename_

Is the name for the object file.

dir

Is the directory where the object file should be placed. It can include _filename_.

Default

OFF

An object file has the same name as the name of the first source file and a file extension of .obj.

Description

This option specifies the name for an object file.

IDE Equivalent

Visual Studio: **Output Files > Object File Name**

Alternate Options

None

See Also

o compiler option

Fp

_Lets you specify an alternate path or file name for precompiled header files._

Syntax

**Linux OS and macOS:**

None

**Windows OS:**

/Fp{filename|dir}

Arguments

_filename_

Is the name for the precompiled header file.

dir

Is the directory where the precompiled header file should be placed. It can include _filename_.

Default

OFF

The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option lets you specify an alternate path or file name for precompiled header files.

IDE Equivalent

Visual Studio: **Precompiled Headers > Precompiled Header Output File**

Eclipse: None
Xcode: None

Alternate Options
None

FR
Invokes the Microsoft C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.

Syntax
Linux OS and macOS:
None

Windows OS:
/FR[filename|dir]

Arguments
filename
Is the name for the BSCMAKE .sbr file.

dir
Is the directory where the file should be placed. It can include filename.

Default
OFF
The compiler does not invoke the Microsoft* C/C++ compiler to produce a .sbr file.

Description
This option invokes the Microsoft* C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.

You can provide a name for the file. If you do not specify a file name, the .sbr file gets the same base name as the source file.

A synonym for option /FR is option /Fr. Option /Fr is a deprecated option.

IDE Equivalent
Visual Studio: Browse Information > Browse Information File
Browse Information > Enable Browse Information
Eclipse: None
Xcode: None

Alternate Options
None

fsource-asm
Produces an assembly listing with source code annotations.
Syntax
Linux OS and macOS:
-`-fsource-asm`

Windows OS:
None

Arguments
None

Default
OFF  
No source code annotations appear in the assembly listing file, if one is produced.

Description
This option produces an assembly listing file with source code annotations. The assembly listing file shows the source code as interspersed comments.
To use this option, you must also specify option `-S`, which causes an assembly listing to be generated.

IDE Equivalent
None

Alternate Options
None

See Also
`s` compiler option

*ftrapuv, Qtrapuv*

*Initializes stack local variables to an unusual value to aid error detection.*

Syntax
Linux OS and macOS:
-`-ftrapuv`

Windows OS:
`/Qtrapuv`

Arguments
None

Default
OFF  
The compiler does not initialize local variables.

Description
This option initializes stack local variables to an unusual value to aid error detection. Normally, these local variables should be initialized in the application. It also unmarks the floating-point invalid exception.
The option sets any uninitialized local variables that are allocated on the stack to a value that is typically interpreted as a very large integer or an invalid address. References to these variables are then likely to cause run-time errors that can help you detect coding errors.

This option sets option `-g` (Linux* and macOS*) and `/Zi` or `/Z7` (Windows*), which changes the default optimization level from `-O2` to `-O0` (Linux and macOS*) or `/Od` (Windows). You can override this effect by explicitly specifying an `O` option setting.

If option `-O2` and option `-ftrapuv` (Linux and macOS*) or `/Qtrapuv` (Windows) are used together, you should specify option `-fp-speculation safe` (Linux and macOS*) or `/Qfp-speculation:safe` (Windows) to prevent exceptions resulting from speculated floating-point operations from being trapped.

For more details on using options `-ftrapuv` and `/Qtrapuv` with compiler option `O`, see the article in Intel® Developer Zone titled *Don't optimize when using -ftrapuv for uninitialized variable detection*, which is located in https://software.intel.com/en-us/articles/dont-optimize-when-using-ftrapuv-for-uninitialized-variable-detection/.

Another way to detect uninitialized local scalar variables is by specifying keyword `uninit` for option `check`.

**IDE Equivalent**

Visual Studio: None

Eclipse: Run-Time > Initialize Stack Variables to an Unusual Value

Xcode: Code Generation > Initialize Stack Variables to an Unusual Value

**Alternate Options**

None

**See Also**

g compiler option

`Zi`, `Z7`, `ZI` compiler option

`O` compiler option

`check` compiler option (see setting `uninit`)

**fverbose-asm**

*Produces an assembly listing with compiler comments, including options and version information.*

**Syntax**

**Linux OS and macOS:**

- `-fverbose-asm`
- `-fno-verbose-asm`

**Windows OS:**

None

**Arguments**

None

**Default**

- `-fno-verbose-asm` No source code annotations appear in the assembly listing file, if one is produced.
**Description**

This option produces an assembly listing file with compiler comments, including options and version information.

To use this option, you must also specify `-S`, which sets `-fverbose-asm`.

If you do not want this default when you specify `-S`, specify `-fno-verbose-asm`.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

`s` compiler option

**g**

*Tells the compiler to generate a level of debugging information in the object file.*

**Syntax**

Linux OS and macOS:

`-g[n]`

Windows OS:

See option Zi, Z7, ZI.

**Arguments**

`n`  
Is the level of debugging information to be generated. Possible values are:

- 0  
  Disables generation of symbolic debug information.

- 1  
  Produces minimal debug information for performing stack traces.

- 2  
  Produces complete debug information. This is the same as specifying `-g` with no `n`.

- 3  
  Produces extra information that may be useful for some tools.

**Default**

`-g` or `-g2`  
The compiler produces complete debug information.

**Description**

Option `-g` tells the compiler to generate symbolic debugging information in the object file, which increases the size of the object file.

The compiler does not support the generation of debugging information in assemblable files. If you specify this option, the resulting object file will contain debugging information, but the assemblable file will not.

This option turns off option `-O2` and makes option `-O0` the default unless option `-O2` (or higher) is explicitly specified in the same command line.
Specifying the -g or -O0 option sets the -fno-omit-frame-pointer option. On Linux*, the -debug inline-debug-info option will be enabled by default if you compile with optimizations (option -O2 or higher) and debugging is enabled (option -g).

**NOTE**
When option -g is specified, debugging information is generated in the DWARF Version 3 format. Older versions of some analysis tools may require applications to be built with the -gdwarf-2 option to ensure correct operation.

**IDE Equivalent**
Visual Studio: None
Eclipse: **General > Include Debug Information**
Xcode: **General > Generate Debug Information**

**Alternate Options**
Linux: None
Windows: /Zi, /Z7, /ZI

**See Also**
gdwarf compiler option
Zi, Z7, ZI compiler option
debug (Linux* and macOS*) compiler option

**gdwarf**
*Lets you specify a DWARF Version format when generating debug information.*

**Syntax**

**Linux OS and macOS:**

-`-gdwarf-n`

**Windows OS:**

None

**Arguments**

<table>
<thead>
<tr>
<th>n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Generates debug information using the DWARF Version 2 format.</td>
</tr>
<tr>
<td>3</td>
<td>Generates debug information using the DWARF Version 3 format.</td>
</tr>
<tr>
<td>4</td>
<td>Generates debug information using the DWARF Version 4 format. This setting is only available on Linux*.</td>
</tr>
</tbody>
</table>
Default
OFF

No debug information is generated. However, if compiler option `-g` is specified, debugging information is generated in the DWARF Version 3 format.

Description
This option lets you specify a DWARF Version format when generating debug information.

Note that older versions of some analysis tools may require applications to be built with the `-gdwarf-2` option to ensure correct operation.

IDE Equivalent
None

Alternate Options
None

See Also
g compiler option

Gm
Enables a minimal rebuild.

Syntax

Linux OS and macOS:

None

Windows OS:

/Gm

Arguments
None

Default
OFF

Minimal rebuilds are disabled.

Description
This option enables a minimal rebuild.

IDE Equivalent

Visual Studio: **Code Generation > Enable Minimal Rebuild**

Eclipse: None

Xcode: None

Alternate Options
None
**grecord-gcc-switches**  
*Causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.*

**Syntax**

**Linux OS:**
-grecord-gcc-switches

**macOS:**
None

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The command line options that were used to invoke the compiler are not appended to the DW_AT_producer attribute in DWARF debugging information.

**Description**

This option causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.

The options are concatenated with whitespace separating them from each other and from the compiler version.

**IDE Equivalent**
None

**Alternate Options**
None

**gsplit-dwarf**  
*Creates a separate object file containing DWARF debug information.*

**Syntax**

**Linux OS:**
-gsplit-dwarf

**macOS:**
None

**Windows OS:**
None
Arguments
None

Default
OFF

No separate object file containing DWARF debug information is created.

Description
This option creates a separate object file containing DWARF debug information. It causes debug information to be split between the generated object (.o) file and the new DWARF object (.dwo) file.

The DWARF object file is not used by the linker, so this reduces the amount of debug information the linker must process and it results in a smaller executable file.

For this option to perform correctly, you must use binutils-2.24 or later. To debug the resulting executable, you must use gdb-7.6.1 or later.

NOTE
If you use the split executable with a tool that does not support the split DWARF format, it will behave as though the DWARF debug information is absent.

IDE Equivalent
None

Alternate Options
None

map-opts, Qmap-opts
Maps one or more compiler options to their equivalent on a different operating system.

Syntax
Linux OS:
-map-opts

macOS:
None

Windows OS:
/Qmap-opts

Arguments
None

Default
OFF

No platform mappings are performed.

Description
This option maps one or more compiler options to their equivalent on a different operating system. The result is output to stdout.
On Windows systems, the options you provide are presumed to be Windows options, so the options that are output to stdout will be Linux equivalents.

On Linux systems, the options you provide are presumed to be Linux options, so the options that are output to stdout will be Windows equivalents.

The tool can be invoked from the compiler command line or it can be used directly.

No compilation is performed when the option mapping tool is used.

This option is useful if you have both compilers and want to convert scripts or makefiles.

**NOTE**
Compiler options are mapped to their equivalent on the architecture you are using. For example, if you are using a processor with IA-32 architecture, you will only see equivalent options that are available on processors with IA-32 architecture.

**IDE Equivalent**
None

**Alternate Options**
None

**Example**
The following command line invokes the option mapping tool, which maps the Linux options to Windows-based options, and then outputs the results to stdout:

```plaintext
icc -map-opts -xP -O2
```

The following command line invokes the option mapping tool, which maps the Windows options to Linux-based options, and then outputs the results to stdout:

```plaintext
icl /Qmap-opts /QxP /O2
```

**See Also**
Compiler Option Mapping Tool

`o`
Specifies the name for an output file.

**Syntax**

**Linux OS and macOS:**

`-o filename`

**Windows OS:**

See option `Fo`.

**Arguments**

`filename`
Is the name for the output file. The space before `filename` is optional.

**Default**

OFF
The compiler uses the default file name for an output file.
Description
This option specifies the name for an output file as follows:

- If `-c` is specified, it specifies the name of the generated object file.
- If `-S` is specified, it specifies the name of the generated assembly listing file.
- If `-P` is specified, it specifies the name of the generated preprocessor file.

Otherwise, it specifies the name of the executable file.

IDE Equivalent
None

Alternate Options
Linux and macOS*: None
Windows: `/Fe`

See Also
Fo compiler option
Fe compiler option

pch
*Tells the compiler to use appropriate precompiled header files.*

Syntax

Linux OS and macOS:

```
-pch
```

Windows OS:

None

Arguments
None

Default
OFF

The compiler does not create or use precompiled headers unless you tell it to do so.

Description
This option tells the compiler to use appropriate precompiled header (PCH) files. If none are available, they are created as `sourcefile.pchi`. This option is supported for multiple source files.

The `-pch` option will use PCH files created from other sources if the headers files are the same. For example, if you compile `source1.cpp` using `-pch`, then `source1.pchi` is created. If you then compile `source2.cpp` using `-pch`, the compiler will use `source1.pchi` if it detects the same headers.

Caution
Depending on how you organize the header files listed in your sources, this option may increase compile times.
IDE Equivalent
Visual Studio: None
Eclipse: Precompiled Headers > Automatic Processing for Precompiled Headers
Xcode: None

Alternate Options
None

Example
Consider the following command line:

```
icpc -pch source1.cpp source2.cpp
```

It produces the following output when .pchi files exist:

```
"source1.cpp": using precompiled header file "source1.pchi"
"source2.cpp": using precompiled header file "source2.pchi"
```

It produces the following output when .pchi files do not exist:

```
"source1.cpp": creating precompiled header file "source1.pchi"
"source2.cpp": creating precompiled header file "source2.pchi"
```

See Also
-pch-create compiler option
-pch-dir compiler option
-pch-use compiler option

pch-create
*Tells the compiler to create a precompiled header file.*

Syntax

Linux OS and macOS:

- `pch-create filename`

Windows OS:

None

Arguments

*filename*  
Is the name for the precompiled header file. A space must appear before the file name. It can include a path.

Default

OFF  
The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to create a precompiled header (PCH) file. It is supported only for single source file compilations.

Note that the .pchi extension is not automatically appended to the file name.

This option cannot be used in the same compilation as the -pch-use option.
On Windows* systems, option `-pch-create` is equivalent to the `/Yc` option.

**IDE Equivalent**
None

**Alternate Options**
Linux and macOS*: None
Windows: `/Yc`

**Example**
Consider the following command line:

```
icpc -pch-create /pch/foo.pchi foo.cpp
```

This creates the precompiled header file "/pch/foo.pchi".

**See Also**

`pch-use` compiler option

**pch-dir**
*Tells the compiler the location for precompiled header files.*

**Syntax**

**Linux OS and macOS:**

```
-pch-dir dir
```

**Windows OS:**
None

**Arguments**

`dir`  
Is the path for precompiled header files. The path must exist.

**Default**

OFF  
The compiler does not create or use precompiled headers unless you tell it to do so.

**Description**
This option tells the compiler the location for precompiled header files. It denotes where to find precompiled header files, and where new PCH files should be placed.
This option can be used with the `-pch`, `-pch-create`, and `-pch-use` options.

**IDE Equivalent**

Visual Studio: None
Eclipse: **Precompiled Headers > Precompiled Headers' File Directory**
Xcode: **Precompiled Headers > Prefix Header**

**Alternate Options**
None
Example

Consider the following command line:

```bash
icpc -pch -pch-dir /pch source32.cpp
```

It produces the following output:

```
"source32.cpp": creating precompiled header file /pch/source32.pch
```

See Also

pch compiler option
pch-create compiler option
pch-use compiler option

**pch-use**

*Tells the compiler to use a precompiled header file.*

Syntax

**Linux OS and macOS:**

```bash
-pch-use filename
```

**Windows OS:**

None

Arguments

`filename`

Is the name of the precompiled header file to use. A space must appear before the file name. It can include a path.

Default

**OFF**

The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to use a precompiled header (PCH) file.

It is supported for multiple source files when all source files use the same .pchi file.

This option cannot be used in the same compilation as the `-pch-create` option.

To learn how to optimize compile times using the PCH options, see "Using Precompiled Header Files" in the User's Guide.

On Windows* systems, option `-pch-use` is equivalent to the `/Yu` option.

**IDE Equivalent**

None

**Alternate Options**

Linux and macOS*: None

Windows: `/Yu`
Example
Consider the following command line:

```
icpc -pch-use /pch/source32.pchi source.cpp
```

It produces the following output:

```
"source.cpp": using precompiled header file /pch/source32.pchi
```

See Also
- `pch-create` compiler option

pdbfile

*Let you specify the name for a program database (PDB) file created by the linker.*

Syntax

**Linux OS and macOS:**
None

**Windows OS:**

```
/pdbfile[:filename]
```

Arguments

`filename`

Is the name for the PDB file. It can include a path. If you do not specify a file extension, the extension .pdb is used.

Default

OFF

No PDB file is created unless you specify option `/zi`. If you specify option `/zi` the default filename is `executablename.pdb`.

Description

This option lets you specify the name for a program database (PDB) file created by the linker. This option does not affect where the compiler outputs debug information.

To use this option, you must also specify option `/debug:full` or `/Zi`.

If `filename` is not specified, the default file name used is the name of your file with an extension of .pdb.

IDE Equivalent

None

Alternate Options

None

---

**Qpchi**

*Enable precompiled header coexistence to reduce build time.*

---

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Qpchi
/Qpchi-

---

**Arguments**

None

---

**Default**

ON  
The compiler enables precompiled header coexistence.
**Description**
This option enables precompiled header (PCH) files generated by the Intel® C++ compiler and those generated by the Microsoft Visual C++* compiler to coexist, which reduces build time.
If build time is not an issue and you do not want an additional set of PCH files on your system, specify `/Qpchi-`.

**IDE Equivalent**
None

**Alternate Options**
None

---

**Quse-msasm-symbols**
*Tells the compiler to use a dollar sign ("$") when producing symbol names.*

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
`/Quse-msasm-symbols`

**Arguments**
None

**Default**
OFF

The compiler uses a period ("." ) when producing symbol names

**Description**
This option tells the compiler to use a dollar sign ("$") when producing symbol names.
Use this option if you require symbols in your .asm files to contain characters that are accepted by the MS assembler.

**IDE Equivalent**
None

**Alternate Options**
None

---

**RTC**
*Enables checking for certain run-time conditions.*

**Syntax**

**Linux OS and macOS:**
None
Windows OS:
/RTC option

Arguments

option Specifies the condition to check. Possible values are 1, s, u, or c.

Default
OFF No checking is performed for these run-time conditions.

Description
This option enables checking for certain run-time conditions. Using the /RTC option sets __MSVC_RUNTIME_CHECKS = 1.

<table>
<thead>
<tr>
<th>Option</th>

**use-msasm**

*Enables the use of blocks and entire functions of assembly code within a C or C++ file.*

**Syntax**

**Linux OS and macOS:**

- `use-msasm`

**Windows OS:**

None

**Arguments**

None

**Default**

OFF  

The compiler allows a GNU*-style inline assembly format.

**Description**

This option enables the use of blocks and entire functions of assembly code within a C or C++ file. It allows a Microsoft* MASM-style inline assembly block not a GNU*-style inline assembly block.

**IDE Equivalent**

None

**Alternate Options**

- `fasm-blocks`

**V (Windows*)**

*Places the text string specified into the object file being generated by the compiler.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

`/V string`

**Arguments**

*string*  

Is the text string to go into the object file.

**Default**

OFF  

No text string is placed in the object file.

**Description**

Places the text string specified into the object file (.obj) being generated by the compiler.
This option places the text string specified into the object file (.obj) being generated by the compiler. The string also gets propagated into the executable file.

For example, this option is useful if you want to place the version number or copyright information into the object and executable.

If the string contains a space or tab, the string must be enclosed by double quotation marks ("). A backslash (\) must precede any double quotation marks contained within the string.

**IDE Equivalent**

None

**Alternate Options**

None

**Y-**

*Tells the compiler to ignore all other precompiled header files.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/\Y-

**Arguments**

None

**Default**

OFF

The compiler recognizes precompiled header files when certain compiler options are specified.

**Description**

This option tells the compiler to ignore all other precompiled header files.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

Yc compiler option

Yc compiler option

**Yc**

*Tells the compiler to create a precompiled header file.*
Syntax

Linux OS and macOS:

None

Windows OS:

/Yc[filename]

Arguments

filename

Is the name of a C/C++ header file, which is included in the source file using an #include preprocessor directive.

Default

OFF

The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to create a precompiled header (PCH) file. It is supported only for single source file compilations.

When filename is specified, the compiler creates a precompiled header file from the headers in the C/C++ program up to and including the C/C++ header specified.

If you do not specify filename, the compiler compiles all code up to the end of the source file, or to the point in the source file where a hdrstop occurs. The default name for the resulting file is the name of the source file with extension .pchi.

This option cannot be used in the same compilation as the /Yu option.

On Linux* and macOS*, option /Yc is equivalent to the -pch-create option.

IDE Equivalent

Visual Studio: Precompiled Headers > Precompiled Header File

Eclipse: None

Xcode: None

Alternate Options

Linux and macOS*: -pch-create

Windows: None

Example

If option /Fp is used, it names the PCH file. For example, consider the following command lines:

icl /c /Ycheader.h /Fpprecomp foo.cpp

icl /c /Yc /Fpprecomp foo.cpp

In both cases, the name of the PCH file is "precomp.pchi".

If the header file name is specified, the file name is based on the header file name. For example:

icl /c /Ycheader.h foo.cpp

In this case, the name of the PCH file is "header.pchi":
If no header file name is specified, the file name is based on the source file name. For example:

```
icl /c /Yc foo.cpp
```

In this case, the name of the PCH file is "foo.pchi".

**See Also**

Yu compiler option
Fp compiler option

**Yd**

*Tells the compiler to add complete debugging information in all object files created from a precompiled header file when option /Zi or /Z7 is specified. This is a deprecated option. There is no replacement option.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Yd

**Arguments**

None

**Default**

OFF

If /Zi or /Z7 is specified when you are compiling with a precompiled header file using /Yc or /Yu, only one .obj file contains the common debugging information.

**Description**

This option tells the compiler that complete debugging information should be added to all object files created from a precompiled header (PCH) file when option /Zi or /Z7 is specified. It affects precompiled header files that were created by specifying the /Yc option.

Option /Yd has no effect unless option /Zi or /Z7 is specified.

When option /Zi or /Z7 is specified and option /Yd is omitted, the compiler stores common debugging information in only the first object (.obj) file created from the PCH file. This information is not inserted into any .obj files subsequently created from the PCH file, only cross-references to the information are inserted.

**IDE Equivalent**

None

**Alternate Options**

None

**Yu**

*Tells the compiler to use a precompiled header file.*
Syntax

Linux OS and macOS:

None

Windows OS:

/Yu[filename]

Arguments

filename

Is the name of a C/C++ header file, which is included in the source file using an #include preprocessor directive.

Default

OFF

The compiler does not use precompiled header files unless it is told to do so.

Description

This option tells the compiler to use a precompiled header (PCH) file.

It is supported for multiple source files when all source files use the same .pchi file.

The compiler treats all code occurring before the header file as precompiled. It skips to just beyond the #include directive associated with the header file, uses the code contained in the PCH file, and then compiles all code after filename.

If you do not specify filename, the compiler will use a PCH with a name based on the source file name. If you specify option /Fp, it will use the PCH specified by that option.

When this option is specified, the compiler ignores all text, including declarations preceding the #include statement of the specified file.

This option cannot be used in the same compilation as the /Yc option.

On Linux* and macOS* systems, option /Yu is equivalent to the -pch-use option.

IDE Equivalent

Visual Studio: Precompiled Headers > Precompiled Header

Eclipse: None

Xcode: None

Alternate Options

Linux and macOS*: -pch-use

Windows: None

Example

Consider the following command line:

```shell
icl /c /Yuheader.h bar.cpp
```

In this case, the name of the PCH file used is "header.pchi".

In the following command line, no filename is specified:

```shell
icl /Yu bar.cpp
```
In this case, the name of the PCH file used is "bar.pchi".

In the following command line, no filename is specified, but option /Fp is specified:

```plaintext
icl /Yu /Fp precomp bar.cpp
```

In this case, the name of the PCH file used is "precomp.pchi".

**See Also**

Yc compiler option

**Zi, Z7, ZI**

*Tells the compiler to generate full debugging information in either an object (.obj) file or a project database (PDB) file.*

**Syntax**

**Linux OS and macOS:**

See option g.

**Windows OS:**

/Zi

/Z7

/ZI

**Arguments**

None

**Default**

OFF No debugging information is produced.

**Description**

Option /Z7 tells the compiler to generate symbolic debugging information in the object (.obj) file for use with the debugger. No .pdb file is produced by the compiler.

Option /ZI is a synonym for option /Zi.

The /Zi option tells the compiler to generate symbolic debugging information in a program database (PDB) file for use with the debugger. Type information is placed in the .pdb file, and not in the .obj file, resulting in smaller object files in comparison to option /Z7.

When option /Zi is specified, two PDB files are created:

- The compiler creates the program database project.pdb. If you compile a file without a project, the compiler creates a database named vc\*\*\*p.pdb, where \*\*\* represents the major version of Visual C++, for example vc140.pdb.

  This file stores all debugging information for the individual object files and resides in the same directory as the project makefile. If you want to change this name, use option /Fd.

- The linker creates the program database executablename.pdb.

  This file stores all debug information for the .exe file and resides in the debug subdirectory. It contains full debug information, including function prototypes, not just the type information found in vc\*\*\*p.pdb.

Both PDB files allow incremental updates. The linker also embeds the path to the .pdb file in the .exe or .dll file that it creates.
The compiler does not support the generation of debugging information in assemblable files. If you specify these options, the resulting object file will contain debugging information, but the assemblable file will not. These options turn off option /O2 and make option /Od the default unless option /O2 (or higher) is explicitly specified in the same command line.

For more information about the /Z7, /Zi, and /ZI options, see the Microsoft documentation.

**IDE Equivalent**

**Visual Studio:** General > Generate Debug Information

**Eclipse:** None

**Xcode:** None

**Alternate Options**

**Linux:** -g

**Windows:** None

**See Also**

Fd compiler option
g compiler option
debug (Windows*) compiler option

**Zo**

Enables or disables generation of enhanced debugging information for optimized code.

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Zo
/Zo-

**Arguments**

None

**Default**

OFF

The compiler does not generate enhanced debugging information for optimized code.

**Description**

This option enables or disables the generation of additional debugging information for local variables and inlined routines when code optimizations are enabled. It should be used with option /Zi or /Z7 to allow improved debugging of optimized code.

Option /Zo enables generation of this enhanced debugging information. Option /Zo- disables this functionality.

For more information on code optimization, see option /O.
**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
Zi, Z7, ZI compiler option
debug (Windows*) compiler option
d compiler option

**Preprocessor Options**

**A, QA**
Specifies an identifier for an assertion.

**Syntax**

**Linux OS and macOS:**

```
-A name[(value)]
```

**Windows OS:**

```
/QA name[(value)]
```

**Arguments**

- **name**
  Is the identifier for the assertion.

- **value**
  Is an optional value for the assertion. If a value is specified, it must be within quotes, including the parentheses delimiting it.

**Default**

OFF

Assertions have no identifiers or symbol names.

**Description**
This option specifies an identifier (symbol name) for an assertion. It is equivalent to an #assert preprocessing directive.

Note that this option is not the positive form of the C++ /QA- option.

On Linux* systems, because GCC has deprecated assertions, this option has no effect.

**IDE Equivalent**

Visual Studio: None

Eclipse: None

Xcode: **Preprocessor > Undefine All Preprocessor Definitions**

**Alternate Options**
None
Example

To make an assertion for the identifier fruit with the associated values orange and banana use the following command.

On Windows* systems:
```
icl /QA"fruit(orange,banana)" prog1.cpp
```

On Linux* systems:
```
icpc -A"fruit(orange,banana)" prog1.cpp
```

On macOS* systems:
```
icl++ -A"fruit(orange,banana)" prog1.cpp
```
icpc -A"fruit(orange,banana)" prog1.cpp

B

**Specifies a directory that can be used to find include files, libraries, and executables.**

Syntax

**Linux OS and macOS:**

```
-B dir
```

**Windows OS:**

None

Arguments

`dir`  
Is the directory to be used. If necessary, the compiler adds a directory separator character at the end of `dir`.

Default

**OFF**  
The compiler looks for files in the directories specified in your PATH environment variable.

Description

This option specifies a directory that can be used to find include files, libraries, and executables.

The compiler uses `dir` as a prefix.

For include files, the `dir` is converted to `-I/ dir/ include`. This command is added to the front of the includes passed to the preprocessor.

For libraries, the `dir` is converted to `-L/ dir`. This command is added to the front of the standard `-L` inclusions before system libraries are added.

For executables, if `dir` contains the name of a tool, such as `ld` or `as`, the compiler will use it instead of those found in the default directories.

The compiler looks for include files in `dir/ include` while library files are looked for in `dir`.

On Linux* systems, another way to get the behavior of this option is to use the environment variable `GCC_EXEC_PREFIX`. 

Intel® C++ Compiler 19.0 Developer Guide and Reference
IDE Equivalent
None

Alternate Options
None

C
Places comments in preprocessed source output.

Syntax

Linux OS and macOS:
-\(C\)

Windows OS:
/\(C\)

Arguments
None

Default
OFF
No comments are placed in preprocessed source output.

Description
This option places (or preserves) comments in preprocessed source output.
Comments following preprocessing directives, however, are not preserved.

IDE Equivalent
Visual Studio: Preprocessor > Keep Comments
Eclipse: None
Xcode: None

Alternate Options
None

Example
The following commands cause the compiler to preserve comments in the prog1.i preprocessed file.

On Windows* systems:
```
icl /C /P prog1.cpp prog2.cpp
```

On Linux* systems:
```
icpc -C -P prog1.cpp prog2.cpp
```

On macOS* systems:
```
icpc -C -P prog1.cpp prog2.cpp
```
D
Defines a macro name that can be associated with an optional value.

Syntax
Linux OS and macOS:
-D name [=value]

Windows OS:
/D name [=value]

Arguments
name
Is the name of the macro.

value
Is an optional integer or an optional character string delimited by double quotes; for example, \name=string.

Default
OFF
Only default symbols or macros are defined.

Description
Defines a macro name that can be associated with an optional value. This option is equivalent to a #define preprocessor directive.

If a value is not specified, name is defined as "1".

Caution
On Linux* and macOS* systems, if you are not specifying a value, do not use D for name, because it will conflict with the -DD option.

IDE Equivalent
Visual Studio: Preprocessor > Preprocessor Definitions
Eclipse: Preprocessor > Preprocessor Definitions
Xcode: Preprocessor > Preprocessor Definitions

Alternate Options
None

Example
To define a macro called SIZE with the value 100, enter the following command:
On Windows* systems:
icl /DSIZE=100 prog1.cpp
On Linux* systems:
icpc -DSIZE=100 prog1.cpp
On macOS* systems:

```
icpc -DSIZE=100 prog1.cpp
```

If you define a macro, but do not assign a value, the compiler defaults to 1 for the value of the macro.

**See Also**

Additional Predefined Macros

**dD, QdD**

*Same as option -dM, but outputs #define directives in preprocessed source.*

**Syntax**

**Linux OS and macOS:**

```
-dD
```

**Windows OS:**

```
/QdD
```

**Arguments**

None

**Default**

*OFF*  

The compiler does not output #define directives.

**Description**

Same as -dM, but outputs `#define` directives in preprocessed source. To use this option, you must also specify the E option.

**IDE Equivalent**

None

**Alternate Options**

None

**dM, QdM**

*Tells the compiler to output macro definitions in effect after preprocessing.*

**Syntax**

**Linux OS and macOS:**

```
-dM
```

**Windows OS:**

```
/QdM
```

**Arguments**

None
Default

OFF

The compiler does not output macro definitions after preprocessing.

Description

This option tells the compiler to output macro definitions in effect after preprocessing. To use this option, you must also specify option \texttt{E}.

IDE Equivalent

None

Alternate Options

None

See Also

\texttt{E} compiler option

\texttt{dN, QdN}

Same as option \texttt{-D}, but output \texttt{#define} directives contain only macro names.

Syntax

\textbf{Linux OS and macOS:}

\texttt{\textasciitilde dN}

\textbf{Windows OS:}

\texttt{/QdN}

Arguments

None

Default

OFF

The compiler does not output \texttt{#define} directives.

Description

Same as \texttt{-D}, but output \texttt{#define} directives contain only macro names. To use this option, you must also specify option \texttt{E}.

IDE Equivalent

None

Alternate Options

None

\texttt{E}

Causes the preprocessor to send output to stdout.
Syntax

Linux OS and macOS:
- `E`

Windows OS:
/`E`

Arguments
None

Default
OFF

Preprocessed source files are output to the compiler.

Description
This option causes the preprocessor to send output to `stdout`. Compilation stops when the files have been preprocessed.

When you specify this option, the compiler’s preprocessor expands your source module and writes the result to `stdout`. The preprocessed source contains `#line` directives, which the compiler uses to determine the source file and line number.

IDE Equivalent
None

Alternate Options
None

Example
To preprocess two source files and write them to `stdout`, enter the following command:

On Windows* systems:
```
icl /E prog1.cpp prog2.cpp
```

On Linux* systems:
```
icpc -E prog1.cpp prog2.cpp
```

On macOS* systems:
```
icl++ -E prog1.cpp prog2.cpp
icpc -E prog1.cpp prog2.cpp
```

EP

*Causes the preprocessor to send output to stdout, omitting `#line` directives.*

Syntax

Linux OS and macOS:
- `EP`
**Windows OS:**

\(/\text{EP}\)

**Arguments**

None

**Default**

OFF

Preprocessed source files are output to the compiler.

**Description**

This option causes the preprocessor to send output to stdout, omitting #line directives.

If you also specify option \(P\) or Linux* option \(F\), the preprocessor will write the results (without #line directives) to a file instead of stdout.

**IDE Equivalent**

Visual Studio: **Preprocessor > Preprocess Suppress Line Numbers**

Eclipse: None

Xcode: None

**Alternate Options**

None

**Example**

To preprocess to stdout omitting #line directives, enter the following command:

On Windows* systems:

\(\text{icl} \ /\text{EP} \ prog1.cpp \ prog2.cpp\)

On Linux* and macOS* systems:

\(\text{icpc} \ -\text{EP} \ prog1.cpp \ prog2.cpp\)

**FI**

_Tells the preprocessor to include a specified file name as the header file._

**Syntax**

- **Linux OS and macOS:**
  
  None

- **Windows OS:**

  \(/\text{FIfilename}\)

**Arguments**

\(filename\) Is the file name to be included as the header file.
Default

OFF

The compiler uses default header files.

Description

This option tells the preprocessor to include a specified file name as the header file. The file specified with `/FI` is included in the compilation before the first line of the primary source file.

IDE Equivalent

Visual Studio: Advanced > Forced Include File
Eclipse: None
Xcode: None

Alternate Options

None

`gcc`, `gcc-sys`

Determine whether certain GNU macros are defined or undefined.

Syntax

Linux OS and macOS:

`-gcc`
`-no-gcc`
`-gcc-sys`

Windows OS:

None

Arguments

None

Default

`-gcc`

The compiler defines the GNU macros `__GNUC__`, `__GNUC_MINOR__`, and `__GNUC_PATCHLEVEL__`

Description

This option determines whether the GNU macros `__GNUC__`, `__GNUC_MINOR__`, and `__GNUC_PATCHLEVEL__` are defined or undefined.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-gcc</code></td>
<td>Defines GNU macros.</td>
</tr>
<tr>
<td><code>-no-gcc</code></td>
<td>Undefines GNU macros.</td>
</tr>
<tr>
<td><code>-gcc-sys</code></td>
<td>Defines GNU macros only during compilation of system headers.</td>
</tr>
</tbody>
</table>
IDE Equivalent
Visual Studio: None
Eclipse: Preprocessor > gcc Predefined Macro Enablement
Xcode: Preprocessor > Predefine gcc Macros

Alternate Options
None

gcc-include-dir
Controls whether the gcc-specific include directory is put into the system include path.

Syntax
Linux OS:
-gcc-include-dir
-no-gcc-include-dir
macOS:
None
Windows OS:
None

Arguments
None

Default
-gcc-include-dir The gcc-specific include directory is put into the system include path.

Description
This option controls whether the gcc-specific include directory is put into the system include path.
If you specify -no-gcc-include-dir, the gcc-specific include directory will not be put into the system include path.

IDE Equivalent
None

Alternate Options
None

H, QH
Tells the compiler to display the include file order and continue compilation.

Syntax
Linux OS and macOS:
-H
Windows OS:
/QH

Arguments
None

Default
OFF

Compilation occurs as usual.

Description
This option tells the compiler to display the include file order and continue compilation.

IDE Equivalent
None

Alternate Options
None

I
Specifies an additional directory to search for include files.

Syntax
Linux OS and macOS:
-Idir
Windows OS:
/Idir

Arguments
dir

Is the additional directory for the search.

Default
OFF

The default directory is searched for include files.

Description
This option specifies an additional directory to search for include files. To specify multiple directories on the command line, repeat the include option for each directory.

IDE Equivalent
Visual Studio: General > Additional Include Directories
Eclipse: Preprocessor > Additional Include Directories
Xcode: Preprocessor > Additional Include Directories

Alternate Options
None
I-
Splits the include path.

Syntax
Linux OS and macOS:
-I-

Windows OS:
/I-

Arguments
None

Default
OFF
The default directory is searched for include files.

Description
This option splits the include path. It prevents the use of the current directory as the first search directory for '#include "file"'.

If you specify directories using the I option before you specify option I-, the directories are searched only for the case of '#include "file"'; they are not searched for '#include <file>'.

If you specify directories using the I option after you specify option I-, these directories are searched for all '#include' directives.

This option has no effect on option nostdinc++, which searches the standard system directories for header files.

This option is provided for compatibility with gcc.

IDE Equivalent
None

Alternate Options
None

See Also
I compiler option
nostdinc++ compiler option

icc, Qic1
Determines whether certain Intel compiler macros are defined or undefined.

Syntax
Linux OS and macOS:
-icc
-no-icc
Windows OS:
/Qic1
/Qicl-

**Arguments**
None

**Default**
-icc or /Qicl

The __INTEL_COMPILER macros are set to represent the current version of the compiler.

**Description**
This option determines whether certain Intel compiler macros are defined or undefined.
If you specify option -no-icc or /Qicl- , the compiler undefines the __INTEL_COMPILER macros. These macros are defined by default or by specifying -icc or /Qicl.

**IDE Equivalent**
None

**Alternate Options**
None

**idirafter**
Adds a directory to the second include file search path.

**Syntax**

**Linux OS and macOS:**
-idirafterdir

**Windows OS:**
None

**Arguments**

*dir*  
Is the name of the directory to add.

**Default**
OFF

Include file search paths include certain default directories.

**Description**
This option adds a directory to the second include file search path (after -I).

**IDE Equivalent**
None

**Alternate Options**
None
**imacros**  
*Allows a header to be specified that is included in front of the other headers in the translation unit.*

**Syntax**

**Linux OS and macOS:**

```
-imacros filename
```

**Windows OS:**

None

**Arguments**

*filename*  
*Name of header file.*

**Default**

OFF

**Description**

Allows a header to be specified that is included in front of the other headers in the translation unit.

**IDE Equivalent**

None

**Alternate Options**

None

**iprefix**

*Option for indicating the prefix for referencing directories containing header files.*

**Syntax**

**Linux OS and macOS:**

```
-iprefix prefix
```

**Windows OS:**

None

**Arguments**

*prefix*  
*Is the prefix to use.*

**Default**

OFF

**Description**

Options for indicating the prefix for referencing directories containing header files. Use *prefix* with option `-iwithprefix` as a prefix.
iquote
Add directory to the front of the include file search path for files included with quotes but not brackets.

Syntax
Linux OS and macOS:
-iquote dir
Windows OS:
None

Arguments

<table>
<thead>
<tr>
<th>dir</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the name of the directory to add.</td>
</tr>
</tbody>
</table>

Default
OFF
The compiler does not add a directory to the front of the include file search path.

Description
Add directory to the front of the include file search path for files included with quotes but not brackets.

isystem
Specifies a directory to add to the start of the system include path.

Syntax
Linux OS and macOS:
-isystem dir
Windows OS:
None

Arguments

<table>
<thead>
<tr>
<th>dir</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is the directory to add to the system include path.</td>
</tr>
</tbody>
</table>
**Default**

OFF The default system include path is used.

**Description**

This option specifies a directory to add to the system include path. The compiler searches the specified directory for include files after it searches all directories specified by the `-I` compiler option but before it searches the standard system directories.

On Linux* systems, this option is provided for compatibility with gcc.

**IDE Equivalent**

None

**Alternate Options**

None

**iwithprefix**

*Appends a directory to the prefix passed in by -iprefix and puts it on the include search path at the end of the include directories.*

**Syntax**

**Linux OS and macOS:**

`-iwithprefix dir`

**Windows OS:**

None

**Arguments**

*dir* Is the include directory.

**Default**

OFF

**Description**

This option appends a directory to the prefix passed in by -iprefix and puts it on the include search path at the end of the include directories.

**IDE Equivalent**

None

**Alternate Options**

None

**iwithprefixbefore**

*Similar to -iwithprefix except the include directory is placed in the same place as -I command line include directories.*
Syntax

Linux OS and macOS:
-iwithprefixbeforedir

Windows OS:
None

Arguments

dir

Is the include directory.

Default

OFF

Description

Similar to -iwithprefix except the include directory is placed in the same place as -I command line include directories.

IDE Equivalent

None

Alternate Options

None

Kc++, TP

Tell the compiler to process all source or unrecognized file types as C++ source files. This is a deprecated option. The replacement option for Kc++ is -x c++; the replacement option for /TP is /Tp<brfile>.

Syntax

Linux OS and macOS:
-Kc++

Windows OS:
/TP

Arguments

None

Default

OFF

The compiler uses default rules for determining whether a file is a C++ source file.

Description

This option tells the compiler to process all source or unrecognized file types as C++ source files.

IDE Equivalent

Visual Studio: Advanced > Compile As
Eclipse: None
Xcode: None

**Alternate Options**

Linux and macOS*: `-x c++`

Windows: `/Tp`

**M, QM**

*Tells the compiler to generate makefile dependency lines for each source file.*

**Syntax**

**Linux OS and macOS:**

```
-M
```

**Windows OS:**

```
/QM
```

**Arguments**

None

**Default**

OFF

The compiler does not generate makefile dependency lines for each source file.

**Description**

This option tells the compiler to generate makefile dependency lines for each source file, based on the `#include` lines found in the source file.

**IDE Equivalent**

None

**Alternate Options**

None

**MD, QMD**

*Preprocess and compile, generating output file containing dependency information ending with extension .d.*

**Syntax**

**Linux OS and macOS:**

```
-MD
```

**Windows OS:**

```
/QMD
```

**Arguments**

None
Default

OFF

The compiler does not generate dependency information.

Description

Preprocess and compile, generating output file containing dependency information ending with extension .d.

IDE Equivalent

None

Alternate Options

None

MF, QMF

 Tells the compiler to generate makefile dependency information in a file.

Syntax

Linux OS and macOS:

-\texttt{MF}filename

Windows OS:

/\texttt{QMF}filename

Arguments

filename

Is the name of the file where the makefile dependency information should be placed.

Default

OFF

The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency information in a file. To use this option, you must also specify /QM or /QMM.

IDE Equivalent

None

Alternate Options

None

See Also

QM compiler option
QMM compiler option

MG, QMG

 Tells the compiler to generate makefile dependency lines for each source file.
Syntax

Linux OS and macOS:

-MG

Windows OS:

/QMG

Arguments

None

Default

OFF

The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency lines for each source file. It is similar to /QM, but it treats missing header files as generated files.

IDE Equivalent

None

Alternate Options

None

See Also

QM compiler option

MM, QMM

Tells the compiler to generate makefile dependency lines for each source file.

Syntax

Linux OS and macOS:

-MM

Windows OS:

/QMM

Arguments

None

Default

OFF

The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency lines for each source file. It is similar to /QM, but it does not include system header files.

IDE Equivalent

None
Alternate Options
None

See Also
QM compiler option

MMD, QMMD
Tell the compiler to generate an output file containing dependency information.

Syntax
Linux OS and macOS:
-MMD

Windows OS:
/QMMD

Arguments
None

Default
OFF
The compiler does not generate an output file containing dependency information.

Description
This option tells the compiler to preprocess and compile a file, then generate an output file (with extension .d) containing dependency information.

It is similar to /QMD, but it does not include system header files.

IDE Equivalent
None

Alternate Options
None

MP
Tell the compiler to add a phony target for each dependency.

Syntax
Linux OS and macOS:
-mp

Windows OS:
None (see below)

Arguments
None
**Default**

**OFF**

The compiler does not generate dependency information unless it is told to do so.

**Description**

This option tells the compiler to add a phony target for each dependency. Note that this option is not related to Windows* option /MP.

**IDE Equivalent**

None

**Alternate Options**

None

**MQ**

*Changes the default target rule for dependency generation.*

**Syntax**

**Linux OS and macOS:**

-MQtargert

**Windows OS:**

None

**Arguments**

target

Is the target rule to use.

**Default**

**OFF**

The default target rule applies to dependency generation.

**Description**

This option changes the default target rule for dependency generation. It is similar to -MT, but quotes special Make characters.

**IDE Equivalent**

None

**Alternate Options**

None

**MT, QMT**

*Changes the default target rule for dependency generation.*
**Syntax**

**Linux OS and macOS:**

-MT\textit{target}

**Windows OS:**

/QMT\textit{target}

**Arguments**

\textit{target} \hspace{1cm} Is the target rule to use.

**Default**

OFF \hspace{1cm} The default target rule applies to dependency generation.

**Description**

This option changes the default target rule for dependency generation.

**IDE Equivalent**

None

**Alternate Options**

None

**nostdinc++**

\textit{Do not search for header files in the standard directories for C++, but search the other standard directories.}

**Syntax**

**Linux OS and macOS:**

-\textit{nostdinc++}

**Windows OS:**

None

**Arguments**

None

**Default**

OFF

**Description**

Do not search for header files in the standard directories for C++, but search the other standard directories.

**IDE Equivalent**

None
Alternate Options
None

P
Tells the compiler to stop the compilation process and write the results to a file.

Syntax
Linux OS and macOS:

- P

Windows OS:

/P

Arguments
None

Default
OFF Normal compilation is performed.

Description
This option tells the compiler to stop the compilation process after C or C++ source files have been preprocessed and write the results to files named according to the compiler’s default file-naming conventions.

On Linux systems, this option causes the preprocessor to expand your source module and direct the output to a .i file instead of stdout. Unlike the -E option, the output from -P on Linux does not include #line number directives. By default, the preprocessor creates the name of the output file using the prefix of the source file name with a .i extension. You can change this by using the -o option.

IDE Equivalent
Visual Studio: Preprocessor > Generate Preprocessed File
Eclipse: None
Xcode: None

Alternate Options
Linux and macOS*: -F
Windows: None

pragma-optimization-level
Specifies which interpretation of the optimization_level pragma should be used if no prefix is specified.

Syntax
Linux OS and macOS:

-pragma-optimization-level=interpretation
**Windows OS:**
None

**Arguments**

*interpretation*

Compiler-specific interpretation of `optimization_level` pragma. Possible values are:

- **Intel**
  Specify the Intel interpretation.
  
- **GCC**
  Specify the GCC interpretation.

**Default**

```
-pragma-optimization-level=Intel
```

Use the Intel interpretation of the `optimization_level` pragma.

**Description**

Specifies which interpretation of the `optimization_level` pragma should be used if no prefix is specified.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

Compiler Reference: `pragma optimization_level`

**u** *(Windows*)

Disables all predefined macros and assertions.

**Syntax**

Linux OS and macOS:
None

Windows OS:
```
/u
```

**Arguments**

None

**Default**

OFF

Defined preprocessor values are in effect until they are undefined.

**Description**

This option disables all predefined macros and assertions.

**IDE Equivalent**

Visual Studio: **Preprocessor > Undefine All Preprocessor Definitions**

Eclipse: None
**Alternate Options**
None

**U**

_Undefined any definition currently in effect for the specified macro._

**Syntax**

Linux OS and macOS:

```
-UNAME
```

Windows OS:

```
/UName
```

**Arguments**

`name`

Is the name of the macro to be undefined.

**Default**

OFF

Macro definitions are in effect until they are undefined.

**Description**

This option undefines any definition currently in effect for the specified macro. It is equivalent to an `#undef` preprocessing directive.

On Windows systems, use the `/u` option to undefine all previously defined preprocessor values.

**IDE Equivalent**

- Visual Studio: Preprocessor > Undefine Preprocessor Definitions
- Eclipse: Preprocessor > Undefine Preprocessor Definitions
- Xcode: Preprocessor > Undefine Preprocessor Definitions

**Alternate Options**
None

**Example**

To undefine a macro, enter the following command:

On Windows* systems:  

```
icl -Uia32 prog1.cpp
```

On Linux* systems:  

```
icpc -Uia32 prog1.cpp
```

On macOS* systems:  

```
icpc -Uia32 prog1.cpp
```

If you attempt to undefine an ANSI C macro, the compiler will emit an error:

```
invalid macro undeinition: <name of macro>
```
See Also

**undef**

_Disables all predefined macros._

**Syntax**

**Linux OS and macOS:**

\[-\text{undef}\]

**Windows OS:**

None

**Arguments**

None

**Default**

**OFF**

Defined macros are in effect until they are undefined.

**Description**

This option disables all predefined macros.

**IDE Equivalent**

None

**Alternate Options**

None

**X**

_Removals standard directories from the include file search path._

**Syntax**

**Linux OS and macOS:**

\[-x\]

**Windows OS:**

/\_x

**Arguments**

None

**Default**

**OFF**

Standard directories are in the include file search path.

**Description**

This option removes standard directories from the include file search path. It prevents the compiler from searching the default path specified by the INCLUDE environment variable.
On Linux* and macOS* systems, specifying -X (or -noinclude) prevents the compiler from searching in /usr/include for files specified in an INCLUDE statement.

You can use this option with the I option to prevent the compiler from searching the default path for include files and direct it to use an alternate path.

**IDE Equivalent**

Visual Studio: **Preprocessor > Ignore Standard Include Path**

Eclipse: **Preprocessor > Ignore Standard Include Path**

Xcode: **Preprocessor > Ignore Standard Include Path**

**Alternate Options**

Linux and macOS*: **-nostdinc**

Windows: None

**See Also**

I compiler option

**Component Control Options**

**Qinstall**

*Specifies the root directory where the compiler installation was performed.*

**Syntax**

Linux OS and macOS:

- Qinstalldir

Windows OS:

None

**Arguments**

\texttt{dir}

Is the root directory where the installation was performed.

**Default**

OFF

The default root directory for compiler installation is searched for the compiler.

**Description**

This option specifies the root directory where the compiler installation was performed. It is useful if you want to use a different compiler or if you did not use the compilervars shell script to set your environment variables.

**IDE Equivalent**

None

**Alternate Options**

None
Qlocation
Specifies the directory for supporting tools.

Syntax

**Linux OS and macOS:**

```
-Qlocation,string,dir
```

**Windows OS:**

```
/Qlocation,string,dir
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string</code></td>
<td>Is the name of the tool.</td>
</tr>
<tr>
<td><code>dir</code></td>
<td>Is the directory (path) where the tool is located.</td>
</tr>
</tbody>
</table>

Default

**OFF** The compiler looks for tools in a default area.

Description

This option specifies the directory for supporting tools.

`string` can be any of the following:

- `c` - Indicates the Intel® C++ compiler.
- `cpp` (or `fpp`) - Indicates the Intel® C++ preprocessor.
- `cxxinc` - Indicates C++ header files.
- `cinc` - Indicates C header files.
- `asm` - Indicates the assembler.
- `link` - Indicates the linker.
- `prof` - Indicates the profiler.

On Windows* systems, the following is also available:

- `masm` - Indicates the Microsoft assembler.

On Linux* and macOS* systems, the following are also available:

- `as` - Indicates the assembler.
- `gas` - Indicates the GNU assembler. This setting is for Linux* only.
- `ld` - Indicates the loader.
- `gld` - Indicates the GNU loader. This setting is for Linux* only.
- `lib` - Indicates an additional library.
- `crt` - Indicates the `crt%.o` files linked into executables to contain the place to start execution.

On Windows and macOS* systems, you can also specify a tool command name.

The following shows an example on macOS* systems:

```
-Qlocation,ld,/usr/bin               ! This tells the driver to use /usr/bin/ld for the loader
-Qlocation,ld,/usr/bin/gld           ! This tells the driver to use /usr/bin/gld as the loader
```

The following shows an example on Windows* systems:

```
/Qlocation,link,“c:\Program Files\tools\” ! This tells the driver to use c:\Program Files\tools\link.exe for the loader
/Qlocation,link,“c:\Program Files\tools\my_link.exe” ! This tells the driver to use c:\Program Files\tools\my_link.exe as the loader
```
IDE Equivalent
None

Alternate Options
None

See Also
Qoption compiler option

Qoption
Passes options to a specified tool.

Syntax

Linux OS and macOS:
-Qoption,string,options

Windows OS:
/Qoption,string,options

Arguments

string
Is the name of the tool.

options
Are one or more comma-separated, valid options for the designated tool.
Note that certain tools may require that options appear within quotation marks (" ").

Default
OFF
No options are passed to tools.

Description
This option passes options to a specified tool.
If an argument contains a space or tab character, you must enclose the entire argument in quotation marks (" "). You must separate multiple arguments with commas.

string can be any of the following:

- cpp - Indicates the Intel compiler preprocessor.
- c - Indicates the C++ compiler.
- asm - Indicates the assembler.
- link - Indicates the linker.
- prof - Indicates the profiler.
- On Windows* systems, the following is also available:
  - masm - Indicates the Microsoft assembler.
- On Linux* and macOS* systems, the following are also available:
  - as - Indicates the assembler.
  - gas - Indicates the GNU assembler.
  - ld - Indicates the loader.
  - gld - Indicates the GNU loader.
  - lib - Indicates an additional library.
• crt - Indicates the crt%.o files linked into executables to contain the place to start execution.

IDE Equivalent
None

Alternate Options
None

See Also
Qlocation compiler option

Language Options

ansi
Enables language compatibility with the gcc option
ansi.

Syntax

Linux OS and macOS:

-ansi

Windows OS:

None

Arguments

None

Default

OFF GNU C++ is more strongly supported than ANSI C.

Description
This option enables language compatibility with the gcc option -ansi and provides the same level of ANSI standard conformance as that option.
This option sets option fmath-errno.
If you want strict ANSI conformance, use the -strict-ansi option.

IDE Equivalent

Visual Studio: None
Eclipse: Language > ANSI Conformance
Xcode: Language > C Language Dialect and Language > C++ Language Dialect

Alternate Options

None

check
Checks for certain conditions at run time.
Syntax

Linux OS and macOS:
-check=keyword[, keyword...]

Windows OS:
/check:keyword[, keyword...]

Arguments

keyword Specifies the conditions to check. Possible values are:

- **[no]conversions**
  Determines whether checking occurs for converting to smaller types. Keyword `conversions` enables this checking.

- **[no]stack**
  Determines whether checking occurs on the stack frame. Keyword `stack` enables this checking. If `stack` is specified, the stack is checked for buffer overruns and buffer underruns. This option also enforces local variables initialization and stack pointer verification.

- **[no]uninit**
  Determines whether checking occurs for uninitialized variables. Keyword `uninit` enables this checking. If a variable is read before it is written, a run-time error routine will be called.

  Run-time checking of undefined variables is only implemented on local, scalar variables. It is not implemented on dynamically allocated variables, extern variables or static variables. It is not implemented on structs, classes, unions or arrays.

Default

- noconversions
- nostack
- nouninit

No checking is performed for the above run-time conditions.

Description

This option checks for certain conditions at run time.

On Windows* systems, this option disables any default or specified optimizations and applies the `/Od` level of optimization. If you specified optimizations, the compiler emits warning diagnostics for the disabled optimizations.

On Linux* and macOS* systems, this option may disable some optimizations.

**NOTE**

This option requires library support. Depending on the platform, the required library is either in your operating system run-time environment or in your compiler package.
IDE Equivalent

Visual Studio: None

Eclipse: Runtime > Check Stack Frame (-check=stack)
Runtime > Check Type Conversions (-check=conversions)
Runtime > Check Uninitialized Variables (-check=uninit)

Xcode: Runtime > Check Stack Frame (-check=stack)
Runtime > Check Type Conversions (-check=conversions)
Runtime > Check Uninitialized Variables (-check=uninit)

Alternate Options

check: conversions  Linux and macOS*: None
                   Windows: /RTCc
check: stack      Linux and macOS*: None
                   Windows: /RTCs
check: uninit     Linux and macOS*: None
                   Windows: /RTCu

early-template-check

Lets you semantically check template function template prototypes before instantiation.

Syntax

Linux OS and macOS:
-early-template-check
-no-early-template-check

Windows OS:
None

Arguments
None

Default
-no-early-template-check  The prototype instantiation of function templates and function members of class templates is deferred.

Description

Lets you semantically check template function template prototypes before instantiation. On Linux* platforms, gcc 3.4 (or newer) compatibility modes must be in effect. For all macOS* platforms, gcc 4.0 (or newer) is required.

IDE Equivalent
None
Alternate Options
None

fblocks
*Determine whether Apple* blocks are enabled or disabled.*

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
None

macOS:
-fblocks
-fno-blocks

Windows OS:
None

Arguments
None

Default
-fblocks Apple* blocks are enabled.

Description
This option determines whether Apple* blocks (block variable declarations) are enabled or disabled.
If you want to disable Apple* blocks, specify -fno-blocks.
To use this feature, macOS* 10.6 or greater is required.

IDE Equivalent
None

Alternate Options
None

ffriend-injection
*Causes the compiler to inject friend functions into the enclosing namespace.*

Syntax
Linux OS and macOS:
-ffriend-injection
-fno-friend-injection
**Windows OS:**
None

**Arguments**
None

**Default**

- The compiler does not inject friend functions into the enclosing namespace. A friend function that is not declared in an enclosing scope can only be found using argument-dependent lookup.

**Description**

This option causes the compiler to inject friend functions into the enclosing namespace, so they are visible outside the scope of the class in which they are declared.

On Linux systems, in gcc versions 4.1 or later, this is not the default behavior. This option allows compatibility with gcc 4.0 or earlier.

**IDE Equivalent**
None

**Alternate Options**
None

**fno-gnu-keywords**

This option tells the compiler to not recognize `typeof` as a keyword.

**Syntax**

**Linux OS and macOS:**

- `-fno-gnu-keywords`

**Windows OS:**
None

**Arguments**
None

**Default**

- OFF

**Description**

Keyword `typeof` is recognized.

**IDE Equivalent**
None

**Alternate Options**
None
**fno-implicit-inline-templates**
*Tells the compiler to not emit code for implicit instantiations of inline templates.*

**Syntax**

**Linux OS and macOS:**
- `-fno-implicit-inline-templates`

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The compiler handles inlines so that compilations, with and without optimization, will need the same set of explicit instantiations.

**Description**
This option tells the compiler to not emit code for implicit instantiations of inline templates.

**IDE Equivalent**
None

**Alternate Options**
None

**fno-implicit-templates**
*Tells the compiler to not emit code for non-inline templates that are instantiated implicitly.*

**Syntax**

**Linux OS and macOS:**
- `-fno-implicit-templates`

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The compiler handles inlines so that compilations, with and without optimization, will need the same set of explicit instantiations.

**Description**
This option tells the compiler to not emit code for non-inline templates that are instantiated implicitly, but to only emit code for explicit instantiations.
IDE Equivalent
None

Alternate Options
None

**fno-operator-names**
_Disables support for the operator names specified in the standard._

Syntax

Linux OS and macOS:
-`-fno-operator-names`

Windows OS:
None

Arguments
None

Default
OFF

Description
Disables support for the operator names specified in the standard.

**fno-rtti**
_Disables support for run-time type information (RTTI)._

Syntax

Linux OS and macOS:
-`-fno-rtti`

Windows OS:
None

Arguments
None

Default
OFF

Support for run-time type information (RTTI) is enabled.
**Description**  
This option disables support for run-time type information (RTTI).

**IDE Equivalent**  
Visual Studio: None  
Eclipse:  
Xcode: **Language > Enable C++ Runtime Types**

**Alternate Options**  
None

**fnon-lvalue-assign**  
*Determine whether casts and conditional expressions can be used as lvalues.*

**Syntax**

**Linux OS and macOS:**  
- `fnon-lvalue-assign`
- `fno-non-lvalue-assign`

**Windows OS:**  
None

**Arguments**  
None

**Default**  
`-fnon-lvalue-assign`  
The compiler allows casts and conditional expressions to be used as lvalues.

**Description**  
This option determines whether casts and conditional expressions can be used as lvalues.

**IDE Equivalent**  
None

**Alternate Options**  
None

**fpermissive**  
*Tells the compiler to allow for non-conformant code.*

**Syntax**

**Linux OS and macOS:**  
- `fpermissive`

**Windows OS:**  
None
**Arguments**
None

**Default**
OFF

**Description**
Tells the compiler to allow for non-conformant code.

**IDE Equivalent**
None

**Alternate Options**
None

**fshort-enums**
*Tells the compiler to allocate as many bytes as needed for enumerated types.*

**Syntax**

**Linux OS and macOS:**
-fshort-enums

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The compiler allocates a default number of bytes for enumerated types.

**Description**
This option tells the compiler to allocate as many bytes as needed for enumerated types.

**IDE Equivalent**
Visual Studio: None
Eclipse: **Data > Associate as Many Bytes as Needed for Enumerated Types**
Xcode: **Data > Allocate enumerated types**

**Alternate Options**
None

**fsyntax-only**
*Tells the compiler to check only for correct syntax.*
Syntax

Linux OS and macOS:
-fsyntax-only

Windows OS:
None

Arguments

None

Default

OFF Normal compilation is performed.

Description

This option tells the compiler to check only for correct syntax. No object file is produced.

IDE Equivalent

None

Alternate Options

Linux and macOS*: None
Windows: /Zs

ftemplate-depth, Qtemplate-depth

Control the depth in which recursive templates are expanded.

Syntax

Linux OS and macOS:
-ftemplate-depth=n

Windows OS:
/Qtemplate-depth:n

Arguments

n The number of recursive templates that are expanded.

Default

OFF The compiler uses default heuristics for the depth of expansion.

Description

Control the depth in which recursive templates are expanded. On Linux*, this option is supported only by invoking the compiler with icpc.

IDE Equivalent

None
Alternate Options
None

**funsigned-bitfields**

*Determines whether the default bitfield type is changed to unsigned.*

**Syntax**

Linux OS and macOS:
- `-funsigned-bitfields`
- `-fno-unsigned-bitfields`

Windows OS:
None

**Arguments**
None

**Default**

- `-fno-unsigned-bitfields`  The default bitfield type is signed.

**Description**

This option determines whether the default bitfield type is changed to `unsigned`.

**IDE Equivalent**

Visual Studio: None
Eclipse: **Data > Change Default Bitfield Type to unsigned**
Xcode: **Data > Unsigned bitfield Type**

Alternate Options
None

**funsigned-char**

*Change default char type to unsigned.*

**Syntax**

Linux OS and macOS:
- `-funsigned-char`

Windows OS:
None

**Arguments**
None
**Default**

OFF  

**Description**  
Change default char type to unsigned.

**IDE Equivalent**  
Visual Studio: None  
Eclipse: **Data > Change default char type to unsigned**  
Xcode: **Data > Unsigned char Type**

**Alternate Options**
None

**GZ**  
*Initializes all local variables. This is a deprecated option. The replacement option is /RTC1.*

**Syntax**

**Linux OS and macOS:**  
None

**Windows OS:**  
/GZ

**Arguments**
None

**Default**

OFF  

**Description**
This option initializes all local variables to a non-zero value. To use this option, you must also specify option /Od.

**IDE Equivalent**
None

**Alternate Options**

Linux and macOS*: None  
Windows: /RTC1

**H (Windows*)**

*Causes the compiler to limit the length of external symbol names. This is a deprecated option. There is no replacement option.*
Syntax

Linux OS and macOS:
None

Windows OS:
/Hn

Arguments

n Is the maximum number of characters for external symbol names.

Default

OFF The compiler follows default rules for the length of external symbol names.

Description

This option causes the compiler to limit the length of external symbol names to a maximum of n characters.

IDE Equivalent

None

Alternate Options

None

help-pragma, Qhelp-pragma
Displays all supported pragmas.

Syntax

Linux OS and macOS:
-help-pragma

Windows OS:
/Qhelp-pragma

Arguments

None

Default

OFF No list is displayed unless this compiler option is specified.

Description

This option displays all supported pragmas and shows their syntaxes.

IDE Equivalent

None

Alternate Options

None
intelmicro-extensions, Qintel-extensions
Enables or disables all Intel® C and Intel® C++ language extensions.

Syntax
Linux OS and macOS:
-intel-extensions
-no-intel-extensions

Windows OS:
/Qintel-extensions
/Qintel-extensions-

Arguments
None

Default
OFF

The Intel® C and Intel® C++ language extensions are enabled.

Description
This option enables or disables all Intel® C and Intel® C++ language extensions.

If you specify the negative form of the option (see above), it disables all Intel® C and Intel® C++ language extensions.

Note that certain settings for the [Q]std compiler option can enable or disable decimal floating-point support:

- The following [Q]std settings enable decimal floating-point support: c89, gnu89 (Linux* only), gnu99 (Linux* only)
- The following [Q]std setting disables decimal floating-point support: c99

IDE Equivalent
Visual Studio: Language > Disable All Intel Language Extensions
Eclipse: Language > Disable All Intel Language Extensions
Xcode: Language > Enable Intel C/C++ language extensions

Alternate Options
None

See Also
cilk-serialize, Qcilk-serialize compiler option
std, Qstd compiler option

\J
Sets the default character type to unsigned.
Syntax

Linux OS and macOS:
None

Windows OS:
/J

Arguments
None

Default
OFF

The default character type is signed

Description
This option sets the default character type to unsigned. This option has no effect on character values that are explicitly declared signed. This option sets _CHAR_UNSIGNED = 1.

IDE Equivalent
Visual Studio: Language > Default Char Unsigned
Eclipse: None
Xcode: None

Alternate Options
None

restrict, Qrestrict
Determines whether pointer disambiguation is enabled with the restrict qualifier.

Syntax

Linux OS and macOS:
-restrict
-no-restrict

Windows OS:
/Qrestrict
/Qrestrict-

Arguments
None

Default
-no-restrict or /Qrestrict- Pointers are not qualified with the restrict keyword.
Description
This option determines whether pointer disambiguation is enabled with the restrict qualifier. Option `-restrict` and `/Qrestrict` enable the recognition of the restrict keyword as defined by the ANSI standard.

By qualifying a pointer with the restrict keyword, you assert that an object accessed by the pointer is only accessed by that pointer in the given scope. You should use the restrict keyword only when this is true. When the assertion is true, the restrict option will have no effect on program correctness, but may allow better optimization.

IDE Equivalent
Visual Studio: **Language > Recognize The Restrict Keyword**
Eclipse: **Language > Recognize The Restrict Keyword**
Xcode: **Language > Recognize RESTRICT keyword**

Alternate Options
None

See Also
std, Qstd compiler option

std, Qstd
Tells the compiler to conform to a specific language standard.

Syntax
**Linux OS and macOS:**
- `-std=val`

**Windows OS:**
- `/Qstd=val`

Arguments
`val` specifies the specific language standard to conform to. Possible values are:

- `c++17`

- `c++14`
  Enables support for the 2014 ISO C++ standard features. The following features are available:
  - Tweaked working for contextual conversion
  - Binary literals
  - decltype(auto), return type deduction for normal functions
  - Initialized lambda captures: simple-capture, init-capture
  - Generic lambda expressions
  - Variable templates
- Extended constexpr
- NSDMIs for aggregates
- Avoiding/fusing allocations
- [deprecated] attributes
- Sized deallocation
- Single-Quotation-Mark as a digit separator

**c++11**

Conforms to The ISO/IEC 9899:2011 International Standard. Enables support for many C++11 (formerly known as C++0x) features. The following features are available:

- Defining move special member functions (N3053)
- Explicit virtual overrides (N2928,N3206,N3272)
- Full implementation of constexpr (this feature is only available on Linux* and macOS* systems)
- Full implementation of initializer lists
- Full implementation of noexcept
- Full implementation of non static data members (i.e. field initializers)
- Raw string literals and UTF-8 literals
- Delegating constructors
- Ref-qualifiers on member functions
- Additional type trait helpers (for example, __is_nothrow_assignable, __is_trivially_assignable, __is_trivially_constructible, __bases, __direct_bases, etc.)

For a list of C++11 features that were previously implemented by the Intel® C++ Compiler, see the article titled C++11 Features Supported by Intel® C++ Compiler, which is located in http://software.intel.com/en-us/articles/c0x-features-supported-by-intel-c-compiler/

**c++0x**

This value is equivalent to specifying value c++11.

**gnu++0x**

This value is equivalent to specifying value c++0x. This value is only available on Linux* and macOS* systems.

**gnu++98**

Conforms to the 1998 ISO C++ standard plus GNU extensions. This value is only available on Linux* and macOS* systems.

**c11**

**c99**

**gnu99**

Conforms to ISO C99 plus GNU* extensions. This value is only available on Linux* and macOS* systems.
Conforms to the ISO/IEC 9899:1990 International Standard. This value is only available on Linux* and macOS* systems.

Conforms to ISO C90 plus GNU* extensions. This value is only available on Linux* and macOS* systems.

Default

-std=gnu89 (default for C)

Conforms to ISO C90 plus GNU extensions.

-std=gnu++98 (default for C++)

Conforms to the 1998 ISO C++ standard plus GNU* extensions.

/Qstd

OFF. Note that a subset of C++11 features is enabled by default for compatibility with a particular version of Microsoft Visual Studio* C++, so you only need to specify /Qstd=c++0x if you want additional C++11 functionality beyond what Microsoft provides.

Description

This option tells the compiler to conform to a specific language standard.

On Windows* systems, you can only specify values c99 and c++0x.

IDE Equivalent

Visual Studio: **Language > C/C++ Language Support**

Eclipse: **Language > ANSI Conformance**

Xcode: **Language > C Language Dialect and C++ Language Dialect**

Alternate Options

None

strict-ansi

* Tells the compiler to implement strict ANSI conformance dialect.*

Syntax

**Linux OS and macOS:**

-strict-ansi

**Windows OS:**

None

Arguments

None

Default

OFF

The compiler conforms to default standards.
Description
This option tells the compiler to implement strict ANSI conformance dialect. On Linux systems, if you need to be compatible with gcc, use the -ansi option.

This option sets option fmath-errno, which tells the compiler to assume that the program tests errno after calls to math library functions. This restricts optimization because it causes the compiler to treat most math functions as having side effects.

IDE Equivalent
Visual Studio: None
Eclipse: **Language > ANSI Conformance**
Xcode: **Language > C Language Dialect and Language > C++ Language Dialect**

Alternate Options
None

vd
Enables or suppresses hidden vtordisp members in C++ objects.

Syntax
Linux OS and macOS:
None

Windows OS:
/vd

Arguments

\( n \)
Possible values are:

0
Suppresses the creation of the hidden vtordisp members in C++ objects.

1
Enables the creation of hidden vtordisp members in C++ objects when they are necessary.

2
Enables the hidden vtordisp members for all virtual base classes with virtual functions. This setting is recommended in the following cases:

- When the only virtual function in your virtual base class is a destructor
- When you want to ensure correct performance of the dynamic_cast operator on a partially-constructed object

Default
/vd1
The compiler enables the creation of hidden vtordisp members in C++ objects when they are necessary.
Description
This option enables or suppresses hidden vtordisp members in C++ objects.
This is a compatibility option for the Microsoft Visual C++* option /vdn. For full details about this compiler option, see the Microsoft* documentation.

IDE Equivalent
None

Alternate Options
None

vmb
Selects the smallest representation that the compiler uses for pointers to members.

Syntax
Linux OS and macOS:
None

Windows OS:
/vmb

Arguments
None

Default
OFF
The compiler uses default rules to represent pointers to members.

Description
This option selects the smallest representation that the compiler uses for pointers to members. Use this option if you define each class before you declare a pointer to a member of the class.

IDE Equivalent
None

Alternate Options
None

vmg
Selects the general representation that the compiler uses for pointers to members.

Syntax
Linux OS and macOS:
None

Windows OS:
/vmg
Arguments
None

Default
OFF

The compiler uses default rules to represent pointers to members.

Description
This option selects the general representation that the compiler uses for pointers to members. Use this option if you declare a pointer to a member before you define the corresponding class.

IDE Equivalent
None

Alternate Options
None

\textbf{vmm}

\textit{Enables pointers to class members with single or multiple inheritance.}

Syntax

\textbf{Linux OS and macOS:}

None

\textbf{Windows OS:}

\textbackslash vmm

Arguments
None

Default
OFF

The compiler uses default rules to represent pointers to members.

Description
This option enables pointers to class members with single or multiple inheritance. To use this option, you must also specify option \textbackslash vmg.

IDE Equivalent
None

Alternate Options
None

\textbf{vms}

\textit{Enables pointers to members of single-inheritance classes.}
Syntax

Linux OS and macOS:
None

Windows OS:
/vms

Arguments
None

Default
OFF

The compiler uses default rules to represent pointers to members.

Description

This option enables pointers to members of single-inheritance classes. To use this option, you must also specify option /vmg.

IDE Equivalent
None

Alternate Options
None

x (type option)

All source files found subsequent to -x type will be recognized as a particular type.

Syntax

Linux OS and macOS:

-x type

Windows OS:
None

Arguments

Type

type

is the type of source file. Possible values are:

- c++: C++ source file
- c++-header: C++ header file
- c++-cpp-output: C++ pre-processed file
- c: C source file
- c-header: C header file
- cpp-output: C pre-processed file
- assembler: Assembly file
assembler-with-cpp
none

Assembly file that needs to be preprocessed
Disable recognition, and revert to file extension

Default
none

Disable recognition and revert to file extension.

Description
All source files found subsequent to \texttt{-xtype} will be recognized as a particular type.

IDE Equivalent
None

Alternate Options
None

Example
Suppose you want to compile the following C and C++ source files whose extensions are not recognized by the compiler:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>file1.c99</td>
<td>C</td>
</tr>
<tr>
<td>file2.cplusplus</td>
<td>C++</td>
</tr>
</tbody>
</table>

We will also include these files whose extensions are recognized:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>file3.c</td>
<td>C</td>
</tr>
<tr>
<td>file4.cpp</td>
<td>C++</td>
</tr>
</tbody>
</table>

The command-line invocation using the \texttt{-x} option follows:

\texttt{icpc -x c file1.c99 -x c++ file2.cplusplus -x none file3.c file4.cpp}

\texttt{Za}

Disables Microsoft Visual C++ compiler language extensions.

Syntax

Linux OS and macOS:
None

Windows OS:
\texttt{/Za}

Arguments
None
Default
OFF

The compiler provides support for extended ANSI C.

Description
Disables Microsoft Visual C++ compiler language extensions.

IDE Equivalent
Visual Studio: Language > Disable Language Extensions
Eclipse: None
Xcode: None

Alternate Options
None

See Also
ze compiler option
zc compiler option

Zc
Lets you specify ANSI C standard conformance for certain language features.

Syntax
Linux OS and macOS:
None

Windows OS:
/Zc:arg[,arg]

Arguments
arg

Is the language feature for which you want standard conformance. Possible values are:

forScope[–]  forScope tells the compiler to use the standard behavior for initializers of for loops. forScope- disables this setting.
wchar_t[–]   wchar_t tells the compiler that wchar_t is a native data type. wchar_t- disables this setting.
auto[–]      auto tells the compiler to comply with the new standard meaning for auto. auto- disables this setting.

Default
/Zc:forScope,wchar_t

The compiler uses the standard behavior for initializers of for loops and it assumes that wchar_t is a native data type.
**Description**
This option lets you specify ANSI C standard conformance for certain language features.

If you do not want the default behavior for one or more of the settings, you must specify the negative form of the setting. For example, if you do not want the `forScope` or `wchar_t` default behavior, you should specify `/Zc:forScope-,wchar_t-`.

The Microsoft* option `/Zc:rvalueCast` is also supported.

**IDE Equivalent**
Visual Studio: **Language > Treat wchar_t as Built-in Type / Force Conformance In For Loop Scope**

**Language > Enforce type conversion rules (rvalueCast)**

Eclipse: None

Xcode: None

**Alternate Options**
None

**Ze**
Enables Microsoft Visual C++* compiler language extensions. This is a deprecated option. There is no replacement option.

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**

/Ze

**Arguments**
None

**Default**
ON

The compiler provides support for extended ANSI C.

**Description**
This option enables Microsoft Visual C++* compiler language extensions.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
`zc` compiler option
`za` compiler option
Zg
Tell the compiler to generate function prototypes.
This is a deprecated option. There is no replacement option.

Syntax
Linux OS and macOS:
None
Windows OS:
/Zg

Arguments
None

Default
OFF
The compiler does not create function prototypes.

Description
This option tells the compiler to generate function prototypes.

IDE Equivalent
None

Alternate Options
None

Zp
Specifies alignment for structures on byte boundaries.

Syntax
Linux OS and macOS:
- Zp[n]
Windows OS:
/Zp[n]

Arguments
n
Is the byte size boundary. Possible values are 1, 2, 4, 8, or 16.

Default
Zp16
Structures are aligned on either size boundary 16 or the boundary that will naturally align them.

Description
This option specifies alignment for structures on byte boundaries.
If you do not specify n, you get Zp16.
**IDE Equivalent**
Visual Studio: **Code Generation > Struct Member Alignment**
Eclipse: **Data > Structure Member Alignment**
Xcode: **Data > Structure Member Alignment**

**Alternate Options**
None

**Zs**
*Tells the compiler to check only for correct syntax.*

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**

`/Zs`

**Arguments**
None

**Default**
OFF  
Normal compilation is performed.

**Description**
This option tells the compiler to check only for correct syntax.

**IDE Equivalent**
None

**Alternate Options**

Linux: `-syntax`, `-fsyntax-only`

Windows: None

**Data Options**

**align**
*Determines whether variables and arrays are naturally aligned.*

**Architecture Restrictions**
Only available on IA-32 architecture

**Syntax**

**Linux OS and macOS:**

`-align`
-noalign

**Windows OS:**
None

**Arguments**
None

**Default**
-noalign

Variables and arrays are aligned according to the gcc model, which means they are aligned to 4-byte boundaries.

**Description**
This option determines whether variables and arrays are naturally aligned. Option -align forces the following natural alignment:

<table>
<thead>
<tr>
<th>Type</th>
<th>Alignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>double</td>
<td>8 bytes</td>
</tr>
<tr>
<td>long long</td>
<td>8 bytes</td>
</tr>
<tr>
<td>long double</td>
<td>16 bytes</td>
</tr>
</tbody>
</table>

If you are not interacting with system libraries or other libraries that are compiled without -align, this option can improve performance by reducing misaligned accesses.

This option can also be specified as -m[no-]align-double. The options are equivalent.

**Caution**
If you are interacting with compatible libraries, this option can improve performance by reducing misaligned accesses. However, if you are interacting with noncompatible libraries or libraries that are compiled without option -align, your application may not perform as expected.

**IDE Equivalent**
None

**Alternate Options**
None

**auto-ilp32, Qauto-ilp32**

_instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux* systems) that can be safely shrunk into 32-bit longs._

**Architecture Restrictions**
Only available on Intel® 64 architecture
Syntax

Linux OS and macOS:
-auto-ilp32

Windows OS:
/Qauto-ilp32

Arguments

None

Default

OFF

The optimization is not attempted.

Description

This option instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux* systems) that can be safely shrunk into 32-bit longs.

On macOS* systems, you must also specify option -no-pie for the optimization to occur.

For this option to be effective, the compiler must be able to optimize using the [Q]ipo option and must be able to analyze all library calls or external calls the program makes. This option has no effect on Linux* systems unless you specify setting SSE3 or higher for option -x.

This option requires that the size of the program executable never exceeds $2^{32}$ bytes and all data values can be represented within 32 bits. If the program can run correctly in a 32-bit system, these requirements are implicitly satisfied. If the program violates these size restrictions, unpredictable behavior may occur.

IDE Equivalent

auto-p32

Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk to 32-bit pointers.

Architecture Restrictions

Only available on Intel® 64 architecture
Syntax

Linux OS and macOS:
- auto-p32

Windows OS:
None

Arguments
None

Default
OFF
The optimization is not performed.

Description
This option instructs the compiler to analyze and transform the program so that 64-bit pointers are shrunk to 32-bit pointers, wherever it is legal and safe to do so.

On macOS* systems, you must also specify option -no-pie for the optimization to occur.

For this option to be effective, the compiler must be able to optimize using the -ipo option and it must be able to analyze all library calls or external calls the program makes. This option has no effect unless you specify setting SSE3 or higher for option -x.

The application cannot exceed a 32-bit address space; otherwise, unpredictable results can occur.

check-pointers, Qcheck-pointers
Determines whether the compiler checks bounds for memory access through pointers.

Syntax

Linux OS:
- check-pointers=keyword

macOS:
None
**Windows OS:**

/`Qcheck-pointers:keyword`

**Arguments**

*keyword*  
Specifies what type of bounds checking occurs. Possible values are:

- *none*  
  Disables bounds checking. This is the default.
- *rw*  
  Checks bounds for reads and writes through pointers.
- *write*  
  Checks bounds for only writes through pointers.

**Default**

- `-check-pointers=none`  
  No bounds checking occurs for memory access through pointers.
- `/Qcheck-pointers:none`

**Description**

This option determines whether the compiler checks bounds for memory access through pointers. It enables checking of all indirect accesses through pointers, and all array accesses.

The compiler may optimize these checks away when it can determine that an access is safe.

When *rw* or *write* is specified, the [Q]check-pointers-undimensioned option is set and dimensioned and undimensioned arrays are checked.

If you do not want undimensioned arrays checked, you must specify option the negative form of the option (see Syntax above).

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

**IDE Equivalent**

Visual Studio:  **Code Generation > Check Pointers**

Eclipse:  **Code Generation > Check Pointers**

Xcode: None

**Alternate Options**

None

**See Also**

compiler option

check-pointers-dangling, Qcheck-pointers-dangling  
compiler option

**check-pointers-dangling, Qcheck-pointers-dangling**

*Determines whether the compiler checks for dangling pointer references.*

**Syntax**

**Linux OS:**

- `-check-pointers-dangling=keyword`
**macOS:**
None

**Windows OS:**
/Qcheck-pointers-dangling:keyword

### Arguments

**keyword**

Specifies what type of dangling pointer checking occurs. Possible values are:

- **none**
  - Disables checking for dangling pointer references. This is the default.

- **heap**
  - Checks for dangling pointer references on the heap.

- **stack**
  - Checks for dangling pointer references on the stack.

- **all**
  - Checks for dangling pointer references on the heap and the stack.

### Default

- `-check-pointers-dangling=none`
  - No checking occurs for dangling pointer references.

  or

  `/Qcheck-pointers-dangling:none`

### Description

This option determines whether the compiler checks for dangling pointer references.

To use this option, you must also specify the `[Q]check-pointers` option.

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

### IDE Equivalent

- **Visual Studio:** Code Generation > Check Dangling Pointers
- **Eclipse:** Code Generation > Check Dangling Pointers
- **Xcode:** None

### Alternate Options

None

### See Also

- check-pointers, Qcheck-pointers
- compiler option

**check-pointers-mpx, Qcheck-pointers-mpx**

Determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® Memory Protection Extensions (Intel® MPX).
Syntax

Linux OS:
- `check-pointers-mpx=keyword`

macOS:
None

Windows OS:
/`Qcheck-pointers-mpx:keyword`

Arguments

`keyword` Specifies what type of bounds checking occurs. Possible values are:

- `none` Disables bounds checking. This is the default.
- `rw` Checks bounds for reads and writes through pointers.
- `write` Checks bounds for only writes through pointers.

Default

- `check-pointers-mpx=none` or
- `/Qcheck-pointers-mpx:none` No bounds checking occurs for memory access through pointers on processors that support Intel® MPX.

Description

This option determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® MPX. It enables checking of all indirect accesses through pointers, and all array accesses.

The compiler may optimize these checks away when it can determine that an access is safe.

If you specify option `/Qcheck-pointers` along with option `/Qcheck-pointers-mpx`, option `/Qcheck-pointers-mpx` takes precedence.

If you specify `/Qcheck-pointers-mpx`, you cannot specify option `/Qcheck-pointers-dangling`.

NOTE

This feature requires supporting hardware, OS, and library support. Intel® MPX bounds exceptions are hardware exceptions that are handled by the OS and run-time library, similar to the way that a null pointer exception is handled. Pointer Checker detailed reports and report control functions are not enabled with Intel® MPX, because these require overriding the OS exception handling.

For more details, see the document titled: Intel® Memory Protection Extensions Enabling Guide, which is located at http://intel.ly/1QI UdJN

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

Visual Studio: Code Generation > Check Pointers
Eclipse: **Code Generation > Check Pointers**

Xcode: None

**Alternate Options**

None

**See Also**

check-pointers, Qcheck-pointers

compiler option

check-pointers-undimensioned, Qcheck-pointers-undimensioned

compiler option

**check-pointers-narrowing, Qcheck-pointers-narrowing**

*Determined whether the compiler enables or disables the narrowing of pointers to structure fields.*

**Syntax**

**Linux OS:**

- `check-pointers-narrowing`
- `no-check-pointers-narrowing`

**macOS:**

None

**Windows OS:**

/Qcheck-pointers-narrowing

/Qcheck-pointers-narrowing-

**Arguments**

None

**Default**

- `check-pointers-narrowing` The compiler enables the narrowing of pointers to structure fields.
  
  or
  
  /Qcheck-pointers-narrowing

**Description**

This option determines whether the compiler enables or disables the narrowing of pointers to structure fields. Narrowing restricts a field pointer so that it can only legally point to that field.

To use this option, you must also specify the [Q]check-pointers option.

Disabling this feature can improve Pointer Checker compatibility with non-ANSI compliant code.

To disable the narrowing of pointers to structure fields, specify the negative form of the option (see Syntax above).

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

**IDE Equivalent**

None
**Alternate Options**
None

**See Also**
check-pointers, Qcheck-pointers
compiler option

**check-pointers-undimensioned, Qcheck-pointers-undimensioned**
Determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.

**Syntax**

**Linux OS:**
- check-pointers-undimensioned
- no-check-pointers-undimensioned

**macOS:**
None

**Windows OS:**
/Qcheck-pointers-undimensioned
/Qcheck-pointers-undimensioned-

**Arguments**
None

**Default**
- check-pointers-undimensioned
  Bounds checking occurs for memory access through arrays that are declared without dimensions. This checking occurs for both dimensioned and undimensioned arrays.
  or
  /Qcheck-pointers-undimensioned

**Description**
This option determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.

To use this option, you must also specify the [Q]check-pointers option.

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

The default setting, [Q]check-pointers-undimensioned, can cause link time errors for multiple definitions for non-standard code and it can cause linker warnings for undefined symbols when linking library code that has not been compiled with pointer checking enabled. In both of these cases, the symbols will contain the string cp_array_end.

To prevent these issues, disable the checking of undimensioned arrays, by specifying the negative form of the option (see Syntax above).

Note that even if you specify the negative form of the option, dimensioned arrays are always checked.
IDE Equivalent
Visual Studio: Code Generation > Turn off Checking for Undimensioned Arrays
Eclipse: Code Generation > Turn off Checking for Undimensioned Arrays
Xcode: None

Alternate Options
None

See Also
check-pointers, Qcheck-pointers
compiler option

falign-functions, Qfnalign
Tells the compiler to align functions on an optimal byte boundary.

Syntax
Linux OS and macOS:
-falign-functions=[n]
-fno-align-functions

Windows OS:
/Qfnalign[:n]
/Qfnalign-

Arguments

$n$

Is an optional positive integer initialization expression indicating the number of bytes for the minimum alignment boundary. It tells the compiler to align functions on a power-of-2 byte boundary. If you do not specify $n$, the compiler aligns the start of functions on 16-byte boundaries.

The $n$ must be a positive integer less than or equal to 4096. If you specify a value that is not a power of 2, $n$ will be rounded up to the nearest power of 2. For example, if 23 is specified for $n$, functions will be aligned on 32 byte boundaries.

Default

-fno-align-functions or /Qfnalign-

The compiler aligns functions on 2-byte boundaries. This is the same as specifying -falign-functions=2 (Linux* and macOS*) or /Qfnalign:2 (Windows*).

Description
This option tells the compiler to align functions on an optimal byte boundary. If you do not specify $n$, the compiler aligns the start of functions on 16-byte boundaries.

IDE Equivalent
None
Alternate Options
None

**falign-loops, Qalign-loops**
*Aligns loops to a power-of-two byte boundary.*

**Syntax**

**Linux OS and macOS:**
- `-falign-loops=[n]`
- `-fno-align-loops`

**Windows OS:**
- `/Qalign-loops[:n]`
- `/Qalign-loops-`

**Arguments**

\( n \)

Is the optional number of bytes for the minimum alignment boundary. It must be a power of 2 between 1 and 4096, such as 1, 2, 4, 8, 16, 32, 64, 128, and so on.

If you specify 1 for \( n \), no alignment is performed; this is the same as specifying the negative form of the option.

If you do not specify \( n \), the default alignment is 16 bytes.

**Default**

- `-fno-align-loops`
  or `/Qalign-loops-`

**No special loop alignment is performed.**

**Description**

This option aligns loops to a power-of-two boundary. This alignment may improve performance.

It can be affected by the pragma `code_align` and attribute `code_align`.

If code is compiled with the `-falign-loops=m` (Linux* and macOS*) or `/Qalign-loops:m` (Windows*) option and a `code_align:n` pragma precedes a loop, the loop is aligned on a max \( (m, n) \) byte boundary. If a function is modified by a `code_align:k` pragma and a `code_align:n` pragma precedes a loop, then both the function and the loop are aligned on a max \( (k, n) \) byte boundary.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
`falign-functions, Qfnalign` compiler option
falign-stack
*Tells the compiler the stack alignment to use on entry to routines.*

Architectural Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

-falign-stack=mode

macOS:

None

Windows OS:

None

Arguments

mode

Is the method to use for stack alignment. Possible values are:

assume-4-byte

Tells the compiler to assume the stack is aligned on 4-byte boundaries. The compiler can dynamically adjust the stack to 16-byte alignment if needed.

maintain-16-byte

Tells the compiler to not assume any specific stack alignment, but to attempt to maintain alignment in case the stack is already aligned. The compiler can dynamically align the stack if needed. This setting is compatible with gcc.

assume-16-byte

Tells the compiler to assume the stack is aligned on 16-byte boundaries and to continue to maintain 16-byte alignment. This setting is compatible with gcc.

Default

-falign-stack=assume-16-byte
The compiler assumes the stack is aligned on 16-byte boundaries and continues to maintain 16-byte alignment.

Description

This option tells the compiler the stack alignment to use on entry to routines.

IDE Equivalent

None

Alternate Options

None

fcommon

*Determines whether the compiler treats common symbols as global definitions.*
Syntax

Linux OS and macOS:
- `fcommon`
- `fno-common`

Windows OS:
None

Arguments
None

Default
- `fcommon`

The compiler does not treat common symbols as global definitions.

Description
This option determines whether the compiler treats common symbols as global definitions and to allocate memory for each symbol at compile time.

Option `-fno-common` tells the compiler to treat common symbols as global definitions. When using this option, you can only have a common variable declared in one module; otherwise, a link time error will occur for multiple defined symbols.

Normally, a file-scope declaration with no initializer and without the `extern` or `static` keyword "int i;" is represented as a common symbol. Such a symbol is treated as an external reference. However, if no other compilation unit has a global definition for the name, the linker allocates memory for it.

IDE Equivalent
Visual Studio: None
Eclipse: Data > Allow gprel Addressing of Common Data Variables
Xcode: Data > Allow gprel Addressing of Common Data Variables

Alternate Options
None

`fextend-arguments`, `Qextend-arguments`
Controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.

Syntax

Linux OS and macOS:
- `fextend-arguments=n`

Windows OS:
`/Qextend-arguments=n`

Arguments

$n$

Specifies the extension for the integer parameters. Possible values are:
32 Causes unprototyped integer parameters to be extended to 32 bits.

64 Causes unprototyped integer parameters to be extended to 64 bits. This value is only available on Intel® 64 architecture.

Default

-fextend-arguments=32 Unprototyped integer parameters are extended to 32 bits.
or /Qextend-arguments:32

Description
This option controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.

IDE Equivalent
None

Alternate Options
None

fkeep-static-consts, Qkeep-static-consts
Tellsthe compiler to preserve allocation of variables that are not referenced in the source.

Syntax

Linux OS and macOS:
-fkeep-static-consts
-fno-keep-static-consts

Windows OS:
/Qkeep-static-consts
/Qkeep-static-consts-

Arguments
None

Default

-fno-keep-static-consts
or /Qkeep-static-consts-

If a variable is never referenced in a routine, the variable is discarded unless optimizations are disabled by option -O0 (Linux* and macOS*) or /Od (Windows*).

Description
This option tells the compiler to preserve allocation of variables that are not referenced in the source.
The negated form can be useful when optimizations are enabled to reduce the memory usage of static data.

IDE Equivalent
None
Alternate Options
None

fmath-errno
Tells the compiler that errno can be reliably tested after calls to standard math library functions.

Syntax
Linux OS and macOS:
- fmath-errno
- fno-math-errno

Windows OS:
None

Arguments
None

Default
-fno-math-errno
The compiler assumes that the program does not test errno after calls to standard math library functions.

Description
This option tells the compiler to assume that the program tests errno after calls to math library functions. This restricts optimization because it causes the compiler to treat most math functions as having side effects.

Option -fno-math-errno tells the compiler to assume that the program does not test errno after calls to math library functions. This frequently allows the compiler to generate faster code. Floating-point code that relies on IEEE exceptions instead of errno to detect errors can safely use this option to improve performance.

IDE Equivalent
None

Alternate Options
None

fminshared
Specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.

Syntax
Linux OS and macOS:
- fminshared

Windows OS:
None
Arguments
None

Default
OFF

Source files are compiled together to form a single object file.

Description
This option specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.

This option allows the compiler to optimize references to defined symbols without special visibility settings. To ensure that external and common symbol references are optimized, you need to specify visibility hidden or protected by using the -fvisibility, -fvisibility-hidden, or -fvisibility-protected option.

Also, the compiler does not need to generate position-independent code for the main program. It can use absolute addressing, which may reduce the size of the global offset table (GOT) and may reduce memory traffic.

IDE Equivalent
None

Alternate Options
None

See Also
fvisibility compiler option

fmudflap
The compiler instruments risky pointer operations to prevent buffer overflows and invalid heap use. This is a deprecated option. There is no replacement option. You can consider using the Pointer Checker options (such as option -check-pointers).

Syntax

Linux OS:
-fmudflap

macOS:
None

Windows OS:
None

Arguments
None

Default
OFF

The compiler does not instrument risky pointer operations.
Description
The compiler instruments risky pointer operations to prevent buffer overflows and invalid heap use. It requires gcc 4.0 or newer.
When using this compiler option, you must specify linker option -lmudflap in the link command line to resolve references to the libmudflap library.

IDE Equivalent
None

Alternate Options
None

fpack-struct
Specifies that structure members should be packed together.

Syntax
Linux OS and macOS:
-fpack-struct
Windows OS:
None

Arguments
None

Default
OFF

Description
Specifies that structure members should be packed together.

NOTE
Using this option may result in code that is not usable with standard (system) c and C++ libraries.

IDE Equivalent
None

Alternate Options
Linux and macOS*: -Zp1
Windows: None

fpascal-strings
Tells the compiler to allow for Pascal-style string literals.
**Architecture Restrictions**
Only available on IA-32 architecture

**Syntax**

**Linux OS:**
- `fpascal-strings`

**macOS:**
None

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The compiler does not allow for Pascal-style string literals.

**Description**
Tells the compiler to allow for Pascal-style string literals.

**IDE Equivalent**
Visual Studio: None
Eclipse: None
Xcode: **Data > Recognize Pascal Strings**

**Alternate Options**
None

**fpic**
Determined whether the compiler generates position-independent code.

**Syntax**

**Linux OS and macOS:**
- `fpic`
- `fno-pic`

**Windows OS:**
None

**Arguments**
None
**Default**

-fno-pic  

The compiler does not generate position-independent code.

**Description**

This option determines whether the compiler generates position-independent code.

Option -fpic specifies full symbol preemption. Global symbol definitions as well as global symbol references get default (that is, preemptable) visibility unless explicitly specified otherwise.

Option -fpic must be used when building shared objects.

This option can also be specified as -fPIC.

**IDE Equivalent**

Visual Studio: None

Eclipse: **Code Generation > Generate Position Independent Code**

Xcode: None

**Alternate Options**

None

**fpie**

_Tells the compiler to generate position-independent code. The generated code can only be linked into executables._

**Syntax**

Linux OS:

-fpie

macOS:

None

Windows OS:

None

**Arguments**

None

**Default**

OFF  

The compiler does not generate position-independent code for an executable-only object.

**Description**

This option tells the compiler to generate position-independent code. It is similar to -fpic, but code generated by -fpie can only be linked into an executable.

Because the object is linked into an executable, this option causes better optimization of some symbol references.
To ensure that run-time libraries are set up properly for the executable, you should also specify option `-pie` to the compiler driver on the link command line.

Option `-fpie` can also be specified as `-fPIE`.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
- fpic compiler option
- pie compiler option

**freg-struct-return**
*Tells the compiler to return struct and union values in registers when possible.*

**Architecture Restrictions**
Only available on IA-32 architecture

**Syntax**

**Linux OS:**
`-freg-struct-return`

**macOS:**
None

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

**Description**
This option tells the compiler to return struct and union values in registers when possible.

**IDE Equivalent**
None

**Alternate Options**
None
**fstack-protector**

*Enables or disables stack overflow security checks for certain (or all) routines.*

**Syntax**

**Linux OS and macOS:**

- `-fstack-protector[-keyword]`
- `-fno-stack-protector[-keyword]`

**Windows OS:**

None

**Arguments**

`keyword`

Possible values are:

- `strong`
  
  When option `-fstack-protector-strong` is specified, it enables stack overflow security checks for routines with any type of buffer.

- `all`
  
  When option `-fstack-protector-all` is specified, it enables stack overflow security checks for every routine.

If no `-keyword` is specified, option `-fstack-protector` enables stack overflow security checks for routines with a string buffer.

**Default**

- `-fno-stack-protector`, `-fno-stack-protector-strong`
- `-fno-stack-protector-all`

No stack overflow security checks are enabled for the relevant routines.

**Description**

This option enables or disables stack overflow security checks for certain (or all) routines. A stack overflow occurs when a program stores more data in a variable on the execution stack than is allocated to the variable. Writing past the end of a string buffer or using an index for an array that is larger than the array bound could cause a stack overflow and security violations.

The `-fstack-protector` options are provided for compatibility with gcc. They use the gcc/glibc implementation when possible. If the gcc/glibc implementation is not available, they use the Intel implementation.

For an Intel-specific version of this feature, see option `-fstack-security-check`.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

`fstack-security-check` compiler option
**GS compiler option**

**fstack-security-check**

*Determine whether the compiler generates code that detects some buffer overruns.*

**Syntax**

*Linux OS and macOS:*

- `-fstack-security-check`
- `-fno-stack-security-check`

*Windows OS:*

None

**Arguments**

None

**Default**

- `-fno-stack-security-check`  *The compiler does not detect buffer overruns.*

**Description**

This option determines whether the compiler generates code that detects some buffer overruns that overwrite the return address. This is a common technique for exploiting code that does not enforce buffer size restrictions.

This option always uses an Intel implementation.

For a gcc-compliant version of this feature, see option `fstack-protector`.

**IDE Equivalent**

None

**Alternate Options**

*Linux and macOS*: None

*Windows*: `/GS`

**See Also**

`fstack-protector` compiler option

`GS` compiler option

**fvisibility**

*Specify the default visibility for global symbols or the visibility for symbols in a file.*

**Syntax**

*Linux OS and macOS:*

- `-fvisibility=keyword`
- `-fvisibility-keyword=filename`
**Windows OS:**
None

**Arguments**

- `keyword` Specifies the visibility setting. Possible values are:
  - `default` Sets visibility to default.
  - `extern` Sets visibility to extern.
  - `hidden` Sets visibility to hidden.
  - `internal` Sets visibility to internal.
  - `protected` Sets visibility to protected. This value is not available on macOS* systems.

- `filename` Is the pathname of a file containing the list of symbols whose visibility you want to set. The symbols must be separated by whitespace (spaces, tabs, or newlines).

**Default**

- `-fvisibility=default` The compiler sets visibility of symbols to default.

**Description**

This option specifies the default visibility for global symbols (syntax `-fvisibility=keyword`) or the visibility for symbols in a file (syntax `-fvisibility-keyword=filename`).

Visibility specified by `-fvisibility-keyword=filename` overrides visibility specified by `-fvisibility=keyword` for symbols specified in a file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-fvisibility=default</code></td>
<td>Sets visibility of symbols to default. This means other components can reference the symbol, and the symbol definition can be overridden (preempted) by a definition of the same name in another component.</td>
</tr>
<tr>
<td><code>-fvisibility-extern=filename</code></td>
<td>Sets visibility of symbols to extern. This means the symbol is treated as though it is defined in another component. It also means that the symbol can be overridden by a definition of the same name in another component.</td>
</tr>
<tr>
<td><code>-fvisibility=hidden</code></td>
<td>Sets visibility of symbols to hidden. This means that other components cannot directly reference the symbol. However, its address may be passed to other components indirectly.</td>
</tr>
<tr>
<td><code>-fvisibility-internal=filename</code></td>
<td>Sets visibility of symbols to internal. This means that the symbol cannot be referenced outside its defining component, either directly or indirectly.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
-fvisibility=protected | The affected functions can never be called from another module, including through function pointers.
-fvisibility-protected=filename | Sets visibility of symbols to protected. This means other components can reference the symbol, but it cannot be overridden by a definition of the same name in another component. This value is not available on macOS* systems.

If an -fvisibility option is specified more than once on the command line, the last specification takes precedence over any others.

If a symbol appears in more than one visibility filename, the setting with the least visibility takes precedence.

The following shows the precedence of the visibility settings (from greatest to least visibility):
- extern
- default
- protected
- hidden
- internal

Note that extern visibility only applies to functions. If a variable symbol is specified as extern, it is assumed to be default.

**IDE Equivalent**
Visual Studio: None
Eclipse: **Data > Default Symbol Visibility**
Xcode: **Data > Default Symbol Visibility**

**Alternate Options**
None

**Example**
A file named prot.txt contains symbols a, b, c, d, and e. Consider the following:

```plaintext
-fvisibility-protected=prot.txt
```

This option sets protected visibility for all the symbols in the file. It has the same effect as specifying fvisibility=protected in the declaration for each of the symbols.

**fvisibility-inlines-hidden**
*Causes inline member functions (those defined in the class declaration) to be marked hidden.*

**Architecture Restrictions**
Only available on IA-32 architecture

**Syntax**

Linux OS:
- `fvisibility-inlines-hidden`
**macOS:**
None

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

The compiler does not cause inline member functions to be marked hidden.

**Description**
Causes inline member functions (those defined in the class declaration) to be marked hidden. This option is particularly useful for templates.

**IDE Equivalent**
None

**Alternate Options**
None

**fzero-initialized-in-bss, Qzero-initialized-in-bss**
Determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.

**Syntax**

**Linux OS and macOS:**
-`-fzero-initialized-in-bss`
-`-fno-zero-initialized-in-bss`

**Windows OS:**
/Qzero-initialized-in-bss
/Qzero-initialized-in-bss-

**Arguments**
None

**Default**
`-fno-zero-initialized-in-bss` or `/Qzero-initialized-in-bss -`

Variables explicitly initialized with zeros are placed in the BSS section. This can save space in the resulting code.

**Description**
This option determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.

If option `-fno-zero-initialized-in-bss` (Linux* and macOS*) or `/Qzero-initialized-in-bss-` (Windows*) is specified, the compiler places in the DATA section any variables that are initialized to zero.
IDE Equivalent

Visual Studio: None

Eclipse: **Data > Disable Placement of Zero-Initialized Variables in .bss - place in .data instead**

Xcode: **Data > Place Zero-Initialized Variables in .bss**

Alternate Options

None

**GA**

*Enables faster access to certain thread-local storage (TLS) variables.*

Syntax

**Linux OS and macOS:**

None

**Windows OS:**

/\GA

Arguments

None

Default

OFF

Default access to TLS variables is in effect.

Description

This option enables faster access to certain thread-local storage (TLS) variables. When you compile your main executable (.EXE) program with this option, it allows faster access to TLS variables declared with the **_declspec(thread)** specification.

Note that if you use this option to compile .DLLs, you may get program errors.

IDE Equivalent

Visual Studio: **Optimization > Optimize for Windows Applications**

Eclipse: None

Xcode: None

Alternate Options

None

**Gs**

*Lets you control the threshold at which the stack checking routine is called or not called.*

Syntax

**Linux OS and macOS:**

None
Windows OS:
/Gs\[n\]

Arguments

\[n\]

Is the number of bytes that local variables and compiler temporaries can occupy before stack checking is activated. This is called the \textit{threshold}.

Default

/Gs

Stack checking occurs for routines that require more than 4KB (4096 bytes) of stack space. This is also the default if you do not specify \[n\].

Description

This option lets you control the threshold at which the stack checking routine is called or not called. If a routine's local stack allocation exceeds the threshold \((n)\), the compiler inserts a \_chkstk() call into the prologue of the routine.

IDE Equivalent

None

Alternate Options

None

GS

\textit{Determines whether the compiler generates code that detects some buffer overruns.}

Syntax

Linux OS and macOS:

None

Windows OS:

/GS[:keyword]

/GS-

Arguments

\[keyword\]

Specifies the level of stack protection heuristics used by the compiler. Possible values are:

- \texttt{off} tells the compiler to ignore buffer overruns. This is the same as specifying \texttt{/GS-}.
- \texttt{partial} tells the compiler to provide a stack protection level that is compatible with Microsoft* Visual Studio 2008.
**strong**

Tells the compiler to provide full stack security level checking. This setting is compatible with more recent Microsoft* Visual Studio stack protection heuristics. This is the same as specifying `/GS` with no keyword.

**Default**

`/GS-`

The compiler does not detect buffer overruns.

**Description**

This option determines whether the compiler generates code that detects some buffer overruns that overwrite a function's return address, exception handler address, or certain types of parameters.

This option has been added for Microsoft compatibility. Following Visual Studio 2008, the Microsoft implementation of option `/GS` became more extensive (for example, more routines are protected). The performance of some programs may be impacted by the newer heuristics. In such cases, you may see better performance if you specify `/GS:partial`.

For more details about option `/GS`, see the Microsoft documentation.

**IDE Equivalent**

Visual Studio: **Code Generation > Security Check**

Eclipse: None

Xcode: None

**Alternate Options**

Linux and macOS*: `-fstack-security-check`

Windows: None

**See Also**

`fstack-security-check` compiler option

`fstack-protector` compiler option

**GT**

*Enables fiber-safe thread-local storage of data.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

`/GT`

**Arguments**

None

**Default**

OFF

There is no fiber-safe thread-local storage.
Description
This option enables fiber-safe thread-local storage (TLS) of data.

IDE Equivalent
Visual Studio: Optimization > Enable Fiber-safe Optimizations
Eclipse: None
Xcode: None

Alternate Options
None

homeparams
Tells the compiler to store parameters passed in registers to the stack.

Architecture Restrictions
Only available on Intel® 64 architecture

Syntax
Linux OS and macOS:
None
Windows OS:
/homeparams

Arguments
None

Default
OFF
Register parameters are not written to the stack.

Description
This option tells the compiler to store parameters passed in registers to the stack.

IDE Equivalent
None

Alternate Options
None

malign-double
Determines whether double, long double, and long long types are naturally aligned. This option is equivalent to specifying option align.

Architecture Restrictions
Only available on IA-32 architecture
Syntax

Linux OS:
- -malign-double
- -mno-align-double

macOS:
None

Windows OS:
None

Arguments
None

Default
- -mno-align-double

Types are aligned according to the gcc model, which means they are aligned to 4-byte boundaries.

Description
For details, see the align option.

IDE Equivalent
None

Alternate Options
None

malign-mac68k
Aligns structure fields on 2-byte boundaries (m68k compatible).

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax

Linux OS:
None

macOS:
- -malign-mac68k

Windows OS:
None

Arguments
None
Default

OFF

The compiler does not align structure fields on 2-byte boundaries.

Description

This option aligns structure fields on 2-byte boundaries (m68k compatible).

IDE Equivalent

None

Alternate Options

None

malign-natural

Aligns larger types on natural size-based boundaries (overrides ABI).

Architecture Restrictions

Not available when targeting Intel® Xeon Phi™ products

Syntax

Linux OS:

None

macOS:

-malign-natural

Windows OS:

None

Arguments

None

Default

OFF

The compiler does not align larger types on natural size-based boundaries.

Description

This option aligns larger types on natural size-based boundaries (overrides ABI).

IDE Equivalent

None

Alternate Options

None

malign-power

Aligns based on ABI-specified alignment rules.
Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
None
macOS:
-malign-power
Windows OS:
None

Arguments
None

Default
ON
The compiler aligns based on ABI-specified alignment rules.

Description
Aligns based on ABI-specified alignment rules.

IDE Equivalent
None

Alternate Options
None

mcmodel
Tells the compiler to use a specific memory model to generate code and store data.

Architecture Restrictions
Only available on Intel® 64 architecture

Syntax
Linux OS:
-mcmodel=mem_model
macOS:
None
Windows OS:
None

Arguments

mem_model
Is the memory model to use. Possible values are:
small

Tells the compiler to restrict code and data to the first 2GB of address space. All accesses of code and data can be done with Instruction Pointer (IP)-relative addressing.

medium

Tells the compiler to restrict code to the first 2GB; it places no memory restriction on data. Accesses of code can be done with IP-relative addressing, but accesses of data must be done with absolute addressing.

large

Places no memory restriction on code or data. All accesses of code and data must be done with absolute addressing.

Default

- mcmodel=small

On systems using Intel® 64 architecture, the compiler restricts code and data to the first 2GB of address space. Instruction Pointer (IP)-relative addressing can be used to access code and data.

Description

This option tells the compiler to use a specific memory model to generate code and store data. It can affect code size and performance. If your program has global and static data with a total size smaller than 2GB, -mcmodel=small is sufficient. Global and static data larger than 2GB requires -mcmodel=medium or -mcmodel=large. Allocation of memory larger than 2GB can be done with any setting of -mcmodel.

IP-relative addressing requires only 32 bits, whereas absolute addressing requires 64-bits. IP-relative addressing is somewhat faster. So, the small memory model has the least impact on performance.

NOTE

When you specify option -mcmodel=medium or -mcmodel=large, it sets option -shared-intel. This ensures that the correct dynamic versions of the Intel run-time libraries are used.

If you specify option -static-intel while -mcmodel=medium or -mcmodel=large is set, an error will be displayed.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how to compile using -mcmodel:

```
icl -shared-intel -mcmodel=medium -o prog prog.c
```

See Also

shared-intel compiler option

fpic compiler option
mdynamic-no-pic
Generates code that is not position-independent but has position-independent external references.

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
None

macOS:
-mdynamic-no-pic

Windows OS:
None

Arguments
None

Default
OFF
All references are generated as position independent.

Description
This option generates code that is not position-independent but has position-independent external references.
The generated code is suitable for building executables, but it is not suitable for building shared libraries.
This option may reduce code size and produce more efficient code. It overrides the -fpic compiler option.

IDE Equivalent
None

Alternate Options
None

See Also
fpic compiler option

mlong-double
Lets you override the default configuration of the long double data type.

Syntax
Linux OS:
-mlong-double

macOS:
None
Windows OS:
None

Arguments

Specifies the size of the long double data type. Possible values are:

- **64**: Specifies that the size of the long double data type is 64 bits.
- **80**: Specifies that the size of the long double data type is 80 bits. This is the default.
- **128**: Specifies that the size of the long double data type is 128 bits.

Default

- **-mlong-double-80**: Specifies that the size of the long double data type is 80 bits.

Description

This option lets you override the default configuration of the long double data type.

- When you specify `-mlong-double-64`, the size of the long double data type is 8 bytes and the macro `__LONG_DOUBLE_64__` is defined.
- When you specify `-mlong-double-80`, the size of the long double data type is 12 bytes on IA-32 architecture and 16 bytes on Intel® 64 architecture.

This option has no effect on floating-point significand precision. That must be specified by using the `-pc64` or `-pc80` option.

Note that this option has no effect when you pass arguments. When you pass arguments, the 64-bit long double data type is treated as the double data type and it is always 64-bit.

Remember to include the math.h and complex.h header files when you use this option.

The following restrictions apply to this option:

- `__bultin_*` functions using the long double type should not be used in the non-default mode with Intel compiler libraries.
- Long double functions from the 'std' namespace should not be called from C++ sources when the non-default mode is set.

IDE Equivalent

None

Alternate Options

Linux and macOS*: None

Windows: `/Qlong-double`

See Also

- `pc`, `Qpc`
- compiler option
**no-bss-init, Qnobss-init**

告诉我们编译器将不初始化变量和显式初始化为零的变量放在DATA节。

**Syntax**

**Linux OS and macOS:**

- `-no-bss-init`

**Windows OS:**

- `/Qnobss-init`

**Arguments**

None

**Default**

OFF

Uninitialized variables and explicitly zero-initialized variables are placed in the BSS section.

**Description**

这个选项告诉编译器将不初始化变量和显式初始化为零的变量放在DATA节。

**IDE Equivalent**

Visual Studio: None

Eclipse: Data > Disable Placement of Zero-initialized and Uninitialized Variables in .bss - place in .data instead

Xcode: Data > Allocate Zero-initialized Variables to .data

**Alternate Options**

None

**noBool**

禁用bool关键字。

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

- `/noBool`

**Arguments**

None
Default
OFF

The bool keyword is enabled.

Description
This option disables the bool keyword.

IDE Equivalent
None

Alternate Options
None

Qlong-double
Changes the default size of the long double data type.

Syntax
Linux OS and macOS:
None

Windows OS:
/Qlong-double

Arguments
None

Default
OFF

The default size of the long double data type is 64 bits.

Description
This option changes the default size of the long double data type to 80 bits.

However, the alignment requirement of the data type is 16 bytes, and its size must be a multiple of its alignment, so the size of a long double on Windows is also 16 bytes. Only the lower 10 bytes (80 bits) of the 16 byte space will have valid data stored in it.

Note that the Microsoft compiler and Microsoft-provided library routines (such as printf or long double math functions) do not provide support for 80-bit floating-point values. As a result, this option should only be used when referencing symbols within parts of your application built with this option or symbols in libraries that were built with this option.

IDE Equivalent
None

Alternate Options
None

Qsfalign
Specifies stack alignment for functions.
**Architecture Restrictions**
Only available on IA-32 architecture

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
/Qsfalign[n]

**Arguments**

$n$  
Is the byte size of aligned variables. Possible values are:

- **8**  
  Specifies that alignment should occur for functions with 8-byte aligned variables. At this setting the compiler aligns the stack to 16 bytes if there is any 16-byte or 8-byte data on the stack. For 8-byte data, the compiler only aligns the stack if the alignment will produce a performance advantage.

- **16**  
  Specifies that alignment should occur for functions with 16-byte aligned variables. At this setting, the compiler only aligns the stack for 16-byte data. No attempt is made to align for 8-byte data.

**Default**
/Qsfalign8  
Alignment occurs for functions with 8-byte aligned variables.

**Description**
This option specifies stack alignment for functions. It lets you disable the normal optimization that aligns a stack for 8-byte data.

If you do not specify $n$, stack alignment occurs for all functions. If you specify /Qsfalign-, no stack alignment occurs for any function.

**IDE Equivalent**
None

**Alternate Options**
None

**Compiler Diagnostic Options**

diag, Qdiag
Controls the display of diagnostic information during compilation.
Syntax

Linux OS and macOS:
- `diag-type=diag-list`

Windows OS:
/`Qdiag-type:diag-list`

Arguments

type

Is an action to perform on diagnostics. Possible values are:

**enable**
Enables a diagnostic message or a group of messages. If you specify `-diag-enable=all` (Linux* and macOS*) or `/Qdiag-enable:all` (Windows*), all diagnostic messages shown in diag-list are enabled.

**disable**
Disables a diagnostic message or a group of messages. If you specify `-diag-disable=all` (Linux* and macOS*) or `/Qdiag-disable:all` (Windows*), all diagnostic messages shown in diag-list are disabled.

**error**
Tells the compiler to change diagnostics to errors.

**warning**
Tells the compiler to change diagnostics to warnings.

**remark**
Tells the compiler to change diagnostics to remarks (comments).

diag-list

Is a diagnostic group or ID value. Possible values are:

**driver**
Specifies diagnostic messages issued by the compiler driver.

**port-linux**
Specifies diagnostic messages for language features that may cause errors when porting to Linux* systems. This diagnostic group is only available on Windows* systems.

**port-win**
Specifies diagnostic messages for GNU extensions that may cause errors when porting to Windows. This diagnostic group is only available on Linux and macOS* systems.

**thread**
Specifies diagnostic messages that help in thread-enabling a program.

**vec**
Specifies diagnostic messages issued by the vectorizer.

**par**
Specifies diagnostic messages issued by the auto-parallelizer (parallel optimizer).

**openmp**
Specifies diagnostic messages issued by the OpenMP* parallelizer.
### warn
Specifies diagnostic messages that have a "warning" severity level.

### error
Specifies diagnostic messages that have an "error" severity level.

### remark
Specifies diagnostic messages that are remarks or comments.

### cpu-dispatch
Specifies the CPU dispatch remarks for diagnostic messages. These remarks are enabled by default.

### id[,id,...]
Specifies the ID number of one or more messages. If you specify more than one message number, they must be separated by commas. There can be no intervening white space between each id.

### tag[,tag,...]
Specifies the mnemonic name of one or more messages. If you specify more than one mnemonic name, they must be separated by commas. There can be no intervening white space between each tag.

The diagnostic messages generated can be affected by certain options, such as \([Q]x\), `/arch` (Windows) or `-m` (Linux and macOS*).

### Default
**OFF**

**The compiler issues certain diagnostic messages by default.**

### Description
This option controls the display of diagnostic information during compilation. Diagnostic messages are output to stderr unless the `[Q]diag-file` option is specified.

To control the diagnostic information reported by the vectorizer, use options `[q or Q]opt-report` and `[q or Q]opt-report-phase, phase vec.

To control the diagnostic information reported by the auto-parallelizer, use options `[q or Q]opt-report` and `[q or Q]opt-report-phase, phase par.

### IDE Equivalent
**Visual Studio:** Diagnostics > Disable Specific Diagnostics (`/Qdiag-disable:id`)

**Advanced > Disable Specific Warnings** (`/Qdiag-disable`)

**Eclipse:** Compilation Diagnostics > Disable Specific Diagnostics

**Xcode:** Diagnostics > Disable Specific Diagnostics

### Alternate Options

**enable vec**

Linux and macOS*: `-qopt-report;` `-qopt-report -qopt-report-phase=vec`

Windows: `/Qopt-report; /Qopt-report /Qopt-report-phase:vec`

**disable vec**

Linux and macOS*: `-qopt-report=0 -qopt-report-phase=vec`
enable par

Windows: /Qopt-report:0 /Qopt-report-phase:vec

Linux and macOS*: -qopt-report;
-qopt-report -qopt-report-phase=par

Windows: /Qopt-report; /Qopt-report /Qopt-report-phase:par

disable par

Windows: /Qopt-report:0 /Qopt-report-phase:par

Linux and macOS*: -qopt-report=0 -qopt-report-phase=par

Example

The following example shows how to enable diagnostic IDs 117, 230 and 450:

```bash
-diag-enable=117,230,450     ! Linux and macOS* systems
/Qdiag-enable:117,230,450    ! Windows systems
```

The following example shows how to change vectorizer diagnostic messages to warnings:

```bash
-diag-enable=vec -diag-warning=vec     ! Linux and macOS* systems
/Qdiag-enable:vec /Qdiag-warning:vec    ! Windows systems
```

Note that you need to enable the vectorizer diagnostics before you can change them to warnings.

The following example shows how to disable all auto-parallelizer diagnostic messages:

```bash
-diag-disable=par     ! Linux and macOS* systems
/Qdiag-disable:par    ! Windows systems
```

The following example shows how to change all diagnostic warnings and remarks to errors:

```bash
-diag-error=warn,remark     ! Linux and macOS* systems
/Qdiag-error:warn,remark    ! Windows systems
```

The following example shows how to get a list of only vectorization diagnostics:

```bash
-diag-dump -diag-disable=all -diag-enable=vec     ! Linux and macOS* systems
/Qdiag-dump /Qdiag-disable:all /Qdiag-enable:vec    ! Windows systems
```

diag-dump, Qdiag-dump

Tell the compiler to print all enabled diagnostic messages.

Syntax

Linux OS and macOS:

- diag-dump

Windows OS:

/Qdiag-dump

Arguments

None
**Default**

OFF

*The compiler issues certain diagnostic messages by default.*

**Description**

This option tells the compiler to print all enabled diagnostic messages. The diagnostic messages are output to stdout.

This option prints the enabled diagnostics from all possible diagnostics that the compiler can issue, including any default diagnostics.

If `diag-list` is specified for the `diag-enable` option, the print out will include the `diag-list` diagnostics.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

The following example adds vectorizer diagnostic messages to the printout of default diagnostics:

```
- diag-enable vec - diag-dump       ! Linux and macOS* systems
/Q diag-enable: vec / Q diag-dump   ! Windows systems
```

**See Also**

diag, Q diag compiler option

**diag-enable=power, Q diag-enable: power**

*Controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.*

**Syntax**

Linux OS and macOS:

- `diag-enable=power`
- `diag-disable=power`

Windows OS:

```
/Q diag-enable: power
/Q diag-disable: power
```

**Arguments**

None

**Default**

- `diag-disable=power` or `/Q diag-disable: power`

*Power consumption diagnostics are disabled.*

**Description**

This option controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.
If you specify option `-diag-enable=power` (Linux* and macOS*) or `/Qdiag-enable:power` (Windows*), the compiler will detect various API calls with argument values in ranges known to be inefficient for power consumption. The diagnostic issued will point out the problem argument; for example, "power inefficient use of 'Sleep' with argument in range [0;10]."

**IDE Equivalent**

None

**Alternate Options**

None

**diag-error-limit, Qdiag-error-limit**

Specifies the maximum number of errors allowed before compilation stops.

**Syntax**

Linux OS and macOS:

- `-diag-error-limit=n`
- `-no-diag-error-limit`

Windows OS:

- `/Qdiag-error-limit:n`
- `/Qdiag-error-limit-`

**Arguments**

- `n` Is the maximum number of error-level or fatal-level compiler errors allowed.

**Default**

- `30` A maximum of 30 error-level and fatal-level messages are allowed.

**Description**

This option specifies the maximum number of errors allowed before compilation stops. It indicates the maximum number of error-level or fatal-level compiler errors allowed for a file specified on the command line.

If you specify the negative form of the [Q]diag-error-limit option on the command line, there is no limit on the number of errors that are allowed.

If the maximum number of errors is reached, a warning message is issued and the next file (if any) on the command line is compiled.

**IDE Equivalent**

Visual Studio: Diagnostics > Error Limit

Eclipse: Compilation Diagnostics > Set Error Limit

Xcode: Diagnostics > Error Limit

**Alternate Options**

Linux and macOS*: `-wn` (this is a deprecated option)
Windows: /Q wn (this is a deprecated option)

**diag-file, Qdiag-file**
*Causes the results of diagnostic analysis to be output to a file.*

**Syntax**

**Linux OS:**
- diag-file[=filename]

**macOS:**
None

**Windows OS:**
/Qdiag-file[:filename]

**Arguments**

*filename*  
Is the name of the file for output.

**Default**

OFF  
Diagnostic messages are output to stderr.

**Description**

This option causes the results of diagnostic analysis to be output to a file. The file is placed in the current working directory.

You can include a file extension in *filename*. For example, if *file.txt* is specified, the name of the output file is *file.txt*. If you do not provide a file extension, the name of the file is *filename.diag*.

If *filename* is not specified, the name of the file is *name-of-the-first-source-file.diag*. This is also the name of the file if the name specified for file conflicts with a source file name provided in the command line.

---

**NOTE**

If you specify the [Q]diag-file option and you also specify the [Q]diag-file-append option, the last option specified on the command line takes precedence.

**IDE Equivalent**

Visual Studio: Diagnostics > Diagnostics File  
Diagnostics > Emit Diagnostics to File

Eclipse: Compilation Diagnostics > Diagnostics File

Xcode: Diagnostics > Diagnostics File, Diagnostics > Emit Diagnostics to File

**Alternate Options**

None
Example
The following example shows how to cause diagnostic analysis to be output to a file named `my_diagnostics.diag`:

```
-diag-file=my_diagnostics       ! Linux systems
/Qdiag-file:my_diagnostics      ! Windows systems
```

See Also
diag-file-append, Qdiag-file-append compiler option

diag-file-append, Qdiag-file-append
Causes the results of diagnostic analysis to be appended to a file.

Syntax
Linux OS:
```
-diag-file-append [=filename]
```

macOS:
None

Windows OS:
```
/Qdiag-file-append[:filename]
```

Arguments
filename
Is the name of the file to be appended to. It can include a path.

Default
OFF
Diagnostic messages are output to stderr.

Description
This option causes the results of diagnostic analysis to be appended to a file. If you do not specify a path, the driver will look for `filename` in the current working directory.

If `filename` is not found, then a new file with that name is created in the current working directory. If the name specified for file conflicts with a source file name provided in the command line, the name of the file is `name-of-the-first-source-file.diag`.

NOTE
If you specify the [Q]diag-file-append option and you also specify the [Q]diag-file option, the last option specified on the command line takes precedence.

IDE Equivalent
None

Alternate Options
None
**Example**

The following example shows how to cause diagnostic analysis to be appended to a file named `my_diagnostics.txt`:

- `diag-file-append=my_diagnostics.txt` ! Linux systems
- `/Qdiag-file-append:my_diagnostics.txt` ! Windows systems

**See Also**

diag-file, Qdiag-file compiler option

diag-id-numbers, Qdiag-id-numbers
Determines whether the compiler displays diagnostic messages by using their ID number values.

**Syntax**

Linux OS and macOS:

- `-diag-id-numbers`
- `-no-diag-id-numbers`

Windows OS:

- `/Qdiag-id-numbers`
- `/Qdiag-id-numbers-`

**Arguments**

None

**Default**

- `-diag-id-numbers`
  
  The compiler displays diagnostic messages by using their ID number values.

- `/Qdiag-id-numbers`

**Description**

This option determines whether the compiler displays diagnostic messages by using their ID number values. If you specify the negative form of the `[Q]diag-id-numbers` option, mnemonic names are output for driver diagnostics only.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

diag, Qdiag compiler option

diag-once, Qdiag-once
Tells the compiler to issue one or more diagnostic messages only once.
**Syntax**

**Linux OS and macOS:**

```
-diag-once [id[,id,...]]
```

**Windows OS:**

```
/Q diag-once:id[,id,...]
```

**Arguments**

id

Is the ID number of the diagnostic message. If you specify more than one message number, they must be separated by commas. There can be no intervening white space between each id.

**Default**

OFF

The compiler issues certain diagnostic messages by default.

**Description**

This option tells the compiler to issue one or more diagnostic messages only once.

**IDE Equivalent**

None

**Alternate Options**

Linux: `-wo` (this is a deprecated option)

Windows: `/Qwo` (this is a deprecated option)

**fnon-call-exceptions**

*Allows trapping instructions to throw C++ exceptions.*

**Syntax**

**Linux OS and macOS:**

```
-fnon-call-exceptions
-fno-non-call-exceptions
```

**Windows OS:**

None

**Arguments**

None

**Default**

-fno-non-call-exceptions

C++ exceptions are not thrown from trapping instructions.

**Description**

This option allows trapping instructions to throw C++ exceptions. It allows hardware signals generated by trapping instructions to be converted into C++ exceptions and caught using the standard C++ exception handling mechanism. Examples of such signals are SIGFPE (floating-point exception) and SIGSEGV (segmentation violation).
You must write a signal handler that catches the signal and throws a C++ exception. After that, any occurrence of that signal within a C++ try block can be caught by a C++ catch handler of the same type as the C++ exception thrown within the signal handler.

Only signals generated by trapping instructions (that is, memory access instructions and floating-point instructions) can be caught. Signals that can occur at any time, such as SIGALRM, cannot be caught in this manner.

**IDE Equivalent**

None

**Alternate Options**

None

**traceback**

*Tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time.*

**Syntax**

**Linux OS and macOS:**

- `traceback`
- `notraceback`

**Windows OS:**

/traceback
/notraceback

**Arguments**

None

**Default**

noextra information is generated in the object file to produce traceback information.

**Description**

This option tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time. This is intended for use with C code that is to be linked into a Fortran program.

When the severe error occurs, source file, routine name, and line number correlation information is displayed along with call stack hexadecimal addresses (program counter trace).

Note that when a severe error occurs, advanced users can also locate the cause of the error using a map file and the hexadecimal addresses of the stack displayed when the error occurs.

This option increases the size of the executable program, but has no impact on run-time execution speeds. It functions independently of the debug option.

On Windows* systems, traceback sets the /Oy- option, which forces the compiler to use EBP as the stack frame pointer.
On Windows* systems, the linker places the traceback information in the executable image, in a section named ".trace". To see which sections are in an image, use the command:

```
link -dump -summary your_app_name.exe
```

To see more detailed information, use the command:

```
link -dump -headers your_app_name.exe
```

On Linux* systems, to display the section headers in the image (including the header for the .trace section, if any), use the command:

```
objdump -h your_app_name.exe
```

On macOS* systems, to display the section headers in the image, use the command:

```
otool -l your_app_name.exe
```

**IDE Equivalent**

Visual Studio: None

Eclipse: **Runtime > Generate Traceback Information**

Xcode: **Runtime > Generate Traceback Information**

**Alternate Options**

None

```
w
```

*Disables all warning messages.*

**Syntax**

**Linux OS and macOS:**

```
-w
```

**Windows OS:**

```
/w
```

**Arguments**

None

**Default**

OFF  
Default warning messages are enabled.

**Description**

This option disables all warning messages.

**IDE Equivalent**

Visual Studio: **General > Warning Level**

Eclipse: **General > Warning Level**

Xcode: **General > Warning Level**

**Alternate Options**

Linux and macOS*: **-w0**
**w, W**

Specifies the level of diagnostic messages to be generated by the compiler.

**Syntax**

**Linux OS and macOS:**

\[-wn\]

**Windows OS:**

\[/Wn\]

**Arguments**

\(n\)

Is the level of diagnostic messages to be generated. Possible values are:

- \(0\)
  - Enables diagnostics for errors. Disables diagnostics for warnings.

- \(1\)
  - Enables diagnostics for warnings and errors.

- \(2\)
  - Enables diagnostics for warnings and errors. On Linux* and macOS* systems, additional warnings are enabled. On Windows* systems, this setting is equivalent to level 1 \((n = 1)\).

- \(3\)
  - Enables diagnostics for remarks, warnings, and errors. Additional warnings are also enabled above level 2 \((n = 2)\). This level is recommended for production purposes.

- \(4\)
  - Enables diagnostics for all level 3 \((n = 3)\) warnings plus informational warnings and remarks, which in most cases can be safely ignored. This value is only available on Windows* systems.

- \(5\)
  - Enables diagnostics for all remarks, warnings, and errors. This setting produces the most diagnostic messages. This value is only available on Windows* systems.

**Default**

\(n=1\)

The compiler displays diagnostics for warnings and errors.

**Description**

This option specifies the level of diagnostic messages to be generated by the compiler.

On Windows systems, option /W4 is equivalent to option /Wall.

The \(-wn\), \[/Wn\], and Wall options can override each other. The last option specified on the command line takes precedence.

**IDE Equivalent**

Visual Studio: **General > Warning Level**
Eclipse: **General > Warning Level**
Xcode: **General > Warning Level**

**Alternate Options**
None

**See Also**
Wall compiler option

**Wabi**
*Determines whether a warning is issued if generated code is not C++ ABI compliant.*

**Syntax**

**Linux OS and macOS:**
- `-Wabi`
- `-Wno-abi`

**Windows OS:**
None

**Arguments**
None

**Default**
- `-Wno-abi`

*No warning is issued when generated code is not C++ ABI compliant.*

**Description**
This option determines whether a warning is issued if generated code is not C++ ABI compliant.

**IDE Equivalent**
None

**Alternate Options**
None

**Wall**
*Enables warning and error diagnostics.*

**Syntax**

**Linux OS and macOS:**
- `-Wall`

**Windows OS:**
/`Wall`

**Arguments**
None
Default
OFF

Description
This option enables many warning and error diagnostics.

On Windows* systems, this option is equivalent to the /W4 option. It enables diagnostics for all level 3 warnings plus informational warnings and remarks.

However, on Linux* and macOS* systems, this option is similar to gcc option -Wall. It displays all errors and some of the warnings that are typically reported by gcc option -Wall. If you want to display all warnings, specify the -w2 or -w3 option. If you want to display remarks and comments, specify the -Wremarks option. The Wall, -wn, and /Wn options can override each other. The last option specified on the command line takes precedence.

IDE Equivalent
None

Alternate Options
None

See Also
diag, Qdiag compiler option
Wremarks compiler option
w, W compiler option

Wbrief
_Tells the compiler to display a shorter form of diagnostic output._

Syntax

Linux OS and macOS:
-Wbrief

Windows OS:
/WL

Arguments
None

Default
OFF

Description
This option tells the compiler to display a shorter form of diagnostic output. In this form, the original source line is not displayed and the error message text is not wrapped when too long to fit on a single line.

IDE Equivalent
None
Alternate Options
Linux and macOS*: None
Windows: /WL

Wcheck
*Tells the compiler to perform compile-time code checking for certain code.*

Syntax
Linux OS and macOS:
- `Wcheck`

Windows OS:
- `/Wcheck`

Arguments
None

Default
OFF - No compile-time code checking is performed.

Description
This option tells the compiler to perform compile-time code checking for certain code. It specifies to check for code that exhibits non-portable behavior, represents a possible unintended code sequence, or possibly affects operation of the program because of a quiet change in the ANSI C Standard.

IDE Equivalent
Visual Studio: None
Eclipse: Compilation Diagnostics > Allow Usage Messages
Xcode: Diagnostics > Allow Usage Messages

Alternate Options
None

Wcomment
*Determines whether a warning is issued when /* appears in the middle of a /* */ comment.*

Syntax
Linux OS and macOS:
- `Wcomment`
- `Wno-comment`

Windows OS:
None
**Arguments**
None

**Default**
-Wno-comment

No warning is issued when /* appears in the middle of a /* */ comment.

**Description**
This option determines whether a warning is issued when /* appears in the middle of a /* */ comment.

**IDE Equivalent**
None

**Alternate Options**
None

**Wcontext-limit, Qcontext-limit**
*Set the maximum number of template instantiation contexts shown in diagnostic.*

**Syntax**

**Linux OS and macOS:**
-Wcontext-limit=n

**Windows OS:**
/Qcontext-limit:n

**Arguments**

n  

Number of template instantiation contexts.

**Default**
OFF

**Description**
Set maximum number of template instantiation contexts shown in diagnostic.

**IDE Equivalent**
None

**Alternate Options**
None

**wd, Qwd**
*Disables a soft diagnostic. This is a deprecated option. The replacement option is [Q]diag-disable.*
Syntax

**Linux OS and macOS:**

```
-wdn[,n]...
```

**Windows OS:**

```
/Qwdn[,n]...
```

**Arguments**

`n` IS the number of the diagnostic to disable.

**Default**

OFF  The compiler returns soft diagnostics as usual.

**Description**

This option disables the soft diagnostic that corresponds to the specified number.

If you specify more than one `n`, each `n` must be separated by a comma.

**IDE Equivalent**

Visual Studio: **Advanced > Disable Specific Warnings**

Eclipse: None

Xcode: None

**Alternate Options**

Linux and macOS*: `-diag-disable`

Windows: `/Qdiag-disable`

---

**Wdeprecated**

Determines whether warnings are issued for deprecated C++ headers.

Syntax

**Linux OS and macOS:**

```
-Wdeprecated
-Wno-deprecated
```

**Windows OS:**

None

**Arguments**

None

**Default**

`-Wdeprecated`  The compiler issues warnings for deprecated C++ headers.
**Description**
This option determines whether warnings are issued for deprecated C++ headers. It has no effect in C compilation mode.

Option `-Wdeprecated` enables these warnings by defining the `__DEPRECATED` macro for preprocessor.

To disable warnings for deprecated C++ headers, specify `-Wno-deprecated`.

**IDE Equivalent**
None

**Alternate Options**
None

**we, Qwe**
Changes a soft diagnostic to an error. This is a deprecated option. The replacement option is `[Q]diag-error`.

**Syntax**

Linux OS and macOS:
```
-\texttt{weLn[,Ln,...]}
```

Windows OS:
```
/Q\texttt{weLn[,Ln,...]}
```

**Arguments**

\( Ln \)

Is the number of the diagnostic to be changed.

**Default**

OFF

The compiler returns soft diagnostics as usual.

**Description**
This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to an error.

Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one \( Ln \), each \( Ln \) must be separated by a comma.

To see the suggested replacement for this option, see Deprecated and Removed Compiler Options.

**IDE Equivalent**
None

**Alternate Options**

Linux and macOS*: `-diag-error`

Windows: `/Qdiag-error`
**Weffc++, Qeffc++**

Enables warnings based on certain C++ programming guidelines.

**Syntax**

**Linux OS and macOS:**

- `Weffc++`

**Windows OS:**

- `/Qeffc++`

**Arguments**

None

**Default**

OFF

Diagnostics are not enabled.

**Description**

This option enables warnings based on certain programming guidelines developed by Scott Meyers in his books on effective C++ programming. With this option, the compiler emits warnings for these guidelines:

- Use `const` and `inline` rather than `#define`. Note that you will only get this in user code, not system header code.
- Use `<iostream>` rather than `<stdio.h>`.
- Use `new` and `delete` rather than `malloc` and `free`.
- Use C++ style comments in preference to C style comments. C comments in system headers are not diagnosed.
- Use `delete` on pointer members in destructors. The compiler diagnoses any pointer that does not have a `delete`.
- Make sure you have a user copy constructor and assignment operator in classes containing pointers.
- Use initialization rather than assignment to members in constructors.
- Make sure the initialization list ordering matches the declaration list ordering in constructors.
- Make sure base classes have virtual destructors.
- Make sure `operator=` returns `*this`.
- Make sure prefix forms of increment and decrement return a `const` object.
- Never overload operators `&&`, `||`, and `,`

**NOTE**

The warnings generated by this compiler option are based on the following books from Scott Meyers:

- Effective C++ Second Edition - 50 Specific Ways to Improve Your Programs and Designs
- More Effective C++ - 35 New Ways to Improve Your Programs and Designs

**IDE Equivalent**

Visual Studio: None

Eclipse: **Compilation Diagnostics > Enable Warnings for Style Guideline Violations**

Xcode: **Diagnostics > Report Effective C++ Violations**

511
Alternate Options
None

**Werror, WX**
Changes all warnings to errors.

**Syntax**
Linux OS and macOS:
- `Werror`

Windows OS:
/`WX`

**Arguments**
None

**Default**
The compiler returns diagnostics as usual.

**Description**
This option changes all warnings to errors.

**IDE Equivalent**
Visual Studio: General > Treat Warnings As Errors
Eclipse: Compilation Diagnostics > Treat Warnings As Errors
Xcode: Diagnostics > Treat Warnings As Errors

Alternate Options
Linux and macOS*: `-diag-error warn`

Windows: `/Qdiag-error:warn`

**Werror-all**
Causes all warnings and currently-enabled remarks to be reported as errors.

**Syntax**
Linux OS and macOS:
- `Werror-all`

Windows OS:
/`Werror-all`

**Arguments**
None
**Default**

OFF

The compiler returns diagnostics as usual.

**Description**

This option causes all warnings and currently-enabled remarks to be reported as errors. To enable display of remarks, specify option `-Wremarks`.

**IDE Equivalent**

None

**Alternate Options**

Linux and macOS*: `-diag-error warn, remark`

Windows: `/Qdiag-error:warn, remark`

**See Also**

diag, Qdiag

Wremarks

**Wextra-tokens**

*Determined whether warnings are issued about extra tokens at the end of preprocessor directives.*

**Syntax**

Linux OS and macOS:

- `-Wextra-tokens`
- `-Wno-extra-tokens`

Windows OS:

None

**Arguments**

None

**Default**

-Wno-extra-tokens

The compiler does not warn about extra tokens at the end of preprocessor directives.

**Description**

This option determines whether warnings are issued about extra tokens at the end of preprocessor directives.

**IDE Equivalent**

None

**Alternate Options**

None
**Wformat**

*Determine whether argument checking is enabled for calls to printf, scanf, and so forth.*

**Syntax**

**Linux OS and macOS:**

- `-Wformat`
- `-Wno-format`

**Windows OS:**

None

**Arguments**

None

**Default**

- `-Wno-format`  
  Argument checking is not enabled for calls to `printf`, `scanf`, and so forth.

**Description**

This option determines whether argument checking is enabled for calls to `printf`, `scanf`, and so forth.

**IDE Equivalent**

None

**Alternate Options**

None

**Wformat-security**

*Determine whether the compiler issues a warning when the use of format functions may cause security problems.*

**Syntax**

**Linux OS and macOS:**

- `-Wformat-security`
- `-Wno-format-security`

**Windows OS:**

None

**Arguments**

None

**Default**

- `-Wno-format-security`  
  No warning is issued when the use of format functions may cause security problems.
**Description**

This option determines whether the compiler issues a warning when the use of format functions may cause security problems.

When `-Wformat-security` is specified, it warns about uses of format functions where the format string is not a string literal and there are no format arguments.

**IDE Equivalent**

None

**Alternate Options**

None

**Wic-pointer**

*Determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.*

**Syntax**

Linux OS and macOS:

- `-Wic-pointer`
- `-Wno-ic-pointer`

Windows OS:

None

**Arguments**

None

**Default**

- `-Wic-pointer`

  The compiler issues warnings for conversions between pointers to distinct scalar types with the same representation.

**Description**

This option determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.

For example, consider the following:

```c
void f(int *p) { long *q = p; }
```

In this case, by default, the compiler issues a warning because of the conversion from pointer to `int` to pointer to `long`.

However, if you specify `-Wno-ic-pointer`, and `long` and `int` values have the same representation on the target platform, the warning will not be issued.

**IDE Equivalent**

None

**Alternate Options**

None
**Winline**

*Warns when a function that is declared as inline is not inlined.*

**Syntax**

**Linux OS and macOS:**

-Winline

**Windows OS:**

None

**Arguments**

None

**Default**

**OFF**

No warning is produced when a function that is declared as inline is not inlined.

**Description**

This option warns when a function that is declared as inline is not inlined.

To see diagnostic messages, including a message about why a particular function was not inlined, you should generate an optimization report by specifying option -qopt-report=5.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

qopt-report, Qopt-report compiler option

**WL**

*Tells the compiler to display a shorter form of diagnostic output.*

**Syntax**

**Linux OS and macOS:**

See Wbrief.

**Windows OS:**

/WL

**Arguments**

None
Default

OFF

The compiler displays its normal diagnostic output.

Description

This option tells the compiler to display a shorter form of diagnostic output. In this form, the original source line is not displayed and the error message text is not wrapped when too long to fit on a single line.

IDE Equivalent

None

Alternate Options

Linux and macOS*: `-Wbrief`

Windows: None

Wmain

Determines whether a warning is issued if the return type of main is not expected.

Syntax

Linux OS and macOS:

- `-Wmain`
- `-Wno-main`

Windows OS:

None

Arguments

None

Default

- `-Wno-main`

No warning is issued if the return type of main is not expected.

Description

This option determines whether a warning is issued if the return type of main is not expected.

IDE Equivalent

None

Alternate Options

None

Wmissing-declarations

Determines whether warnings are issued for global functions and variables without prior declaration.
Syntax

Linux OS and macOS:
- `-Wmissing-declarations`
- `-Wno-missing-declarations`

Windows OS:
None

Arguments
None

Default

- `-Wno-missing-declarations`
  No warnings are issued for global functions and variables without prior declaration.

Description

This option determines whether warnings are issued for global functions and variables without prior declaration.

IDE Equivalent
None

Alternate Options
None

Wmissing-prototypes

Determines whether warnings are issued for missing prototypes.

Syntax

Linux OS and macOS:
- `-Wmissing-prototypes`
- `-Wno-missing-prototypes`

Windows OS:
None

Arguments
None

Default

- `-Wno-missing-prototypes`
  No warnings are issued for missing prototypes.

Description

Determines whether warnings are issued for missing prototypes.

If `-Wmissing-prototypes` is specified, it tells the compiler to detect global functions that are defined without a previous prototype declaration.
### IDE Equivalent

None

### Alternate Options

None

### wn, Qwn

*Controls the number of errors displayed before compilation stops. This is a deprecated option. The replacement option is [Q]diag-error-limit.*

#### Syntax

**Linux OS and macOS:**

```
-wn \(n\)
```

**Windows OS:**

```
/Qwn \(n\)
```

#### Arguments

\(n\) Is the number of errors to display.

#### Default

100 The compiler displays a maximum of 100 errors before aborting compilation.

#### Description

This option controls the number of errors displayed before compilation stops.

### IDE Equivalent

- **Visual Studio:** Diagnostics > Error Limit
- **Eclipse:** Compilation Diagnostics > Set Error Limit
- **Xcode:** Diagnostics > Error Limit

### Alternate Options

- **Linux and macOS:** -diag-error-limit
- **Windows:** /Qdiag-error-limit

### Wnon-virtual-dtor

*Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one.*

#### Syntax

**Linux OS and macOS:**

```
-Wnon-virtual-dtor
```

**Windows:**
Windows OS:
None

Arguments
None

Default
OFF

The compiler does not issue a warning.

Description
Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one. This option is supported in C++ only.

IDE Equivalent
Visual Studio: None
Eclipse: None
Xcode: Diagnostics > Report Non-Virtual Destructor

Alternate Options
None

wo, Qwo
Tells the compiler to issue one or more diagnostic messages only once. This is a deprecated option. The replacement option is [Q]diag-once id.

Syntax
Linux OS and macOS:
-woLn[,Ln,...]

Windows OS:
/QwoLn[,Ln,...]

Arguments
Ln

Is the number of the diagnostic.

Default
OFF

Description
Specifies the ID number of one or more messages. If you specify more than one Ln, each Ln must be separated by a comma.

IDE Equivalent
None
**Alternate Options**

Linux and macOS*: `-diag-once id`

Windows: `/Qdiag-once:id`

---

**Wp64**

*Tells the compiler to display diagnostics for 64-bit porting.*

**Syntax**

Linux OS and macOS:

```
- Wp64
```

Windows OS:

```
/Wp64
```

**Arguments**

None

**Default**

OFF  

The compiler does not display diagnostics for 64-bit porting.

**Description**

This option tells the compiler to display diagnostics for 64-bit porting.

**IDE Equivalent**

Visual Studio: **General > Detect 64-bit Portability Issues**

Eclipse: None

Xcode: None

---

**Alternate Options**

None

---

**Wpch-messages**

*Determines whether the compiler shows precompiled header (PCH) informational messages.*

**Syntax**

Linux OS and macOS:

```
-Wpch-messages
-Wno-pch-messages
```

Windows OS:

```
/Wpch-messages
/Wpch-messages-
```

---

---

521
Arguments
None

Default
-wpch-messages

The compiler shows precompiled header (PCH) informational messages.

Description
This option determines whether the compiler shows precompiled header (PCH) informational messages. By default, these messages are displayed. To suppress the display of the PCH informational messages, specify -Wno-pch-messages (Linux* and macOS*) or /Wpch-messages- (Windows*).

IDE Equivalent
Visual Studio: Precompiled Headers [Intel C++] > Disable Precompiled Header Messages
Eclipse: Precompiled Headers > Disable Precompiled Header Messages
Xcode: Precompiled Headers > Disable Precompiled Header Messages

Alternate Options
None

-wpointer-arith
Determines whether warnings are issued for questionable pointer arithmetic.

Syntax
Linux OS and macOS:
-wpointer-arith
-Wno-pointer-arith

Windows OS:
None

Arguments
None

Default
-Wno-pointer-arith

No warnings are issued for questionable pointer arithmetic.

Description
Determines whether warnings are issued for questionable pointer arithmetic.

IDE Equivalent
None

Alternate Options
None
**Wport**

*Tells the compiler to issue portability diagnostics.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/\Wport

**Arguments**

None

**Default**

OFF The compiler issues default diagnostics.

**Description**

This option tells the compiler to issue portability diagnostics.

**IDE Equivalent**

None

**Alternate Options**

None

**wr, Qwr**

*Changes a soft diagnostic to an remark. This is a deprecated option. The replacement option is \[Q\]diagramremark.*

**Syntax**

**Linux OS and macOS:**

-\wrln[,ln,...]

**Windows OS:**

/Qwrln[,ln,...]

**Arguments**

\ln \hspace{1em} Is the number of the diagnostic to be changed.

**Default**

OFF The compiler returns soft diagnostics as usual.

**Description**

This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to a remark.
Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one Ln, each Ln must be separated by a comma.

**IDE Equivalent**
None

**Alternate Options**
Linux and macOS*: -diag-remark
Windows: /Qdiag-remark

**Wremarks**
_Tells the compiler to display remarks and comments._

**Syntax**

**Linux OS and macOS:**
-Wremarks

**Windows OS:**
None

**Arguments**
None

**Default**
OFF Default warning messages are enabled.

**Description**
This option tells the compiler to display remarks and comments. If you want to display warnings and errors, specify the -Wall, -wn, or /Wn option.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
diag, Qdiag compiler option
Wall compiler option
w, W compiler option

**Wreorder**
_Tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed._
Syntax

Linux OS and macOS:
- Wreorder

Windows OS:
None

Arguments
None

Default
OFF

The compiler does not issue a warning.

Description
This option tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed. This option is supported for C++ only.

IDE Equivalent
None

Alternate Options
None

Wreturn-type
Determines whether warnings are issued when a function is declared without a return type, when the definition of a function returning void contains a return statement with an expression, or when the closing brace of a function returning non-void is reached.

Syntax

Linux OS and macOS:
- Wreturn-type
- Wno-return-type

Windows OS:
None

Arguments
None

Default
ON for one condition

A warning is issued when the closing brace of a function returning non-void is reached.

Description
This option determines whether warnings are issued for the following:
- When a function is declared without a return type
- When the definition of a function returning void contains a return statement with an expression
- When the closing brace of a function returning non-void is reached

Specify `-Wno-return-type` if you do not want to see warnings about the above diagnostics.

**IDE Equivalent**

None

**Alternate Options**

None

**Wshadow**  
*Determines whether a warning is issued when a variable declaration hides a previous declaration.*

**Syntax**

**Linux OS and macOS:**

- `-Wshadow`
- `-Wno-shadow`

**Windows OS:**

None

**Arguments**

None

**Default**

- `-Wno-shadow`  
  No warning is issued when a variable declaration hides a previous declaration.

**Description**

This option determines whether a warning is issued when a variable declaration hides a previous declaration.  
Same as `-Ww1599`.

**IDE Equivalent**

None

**Alternate Options**

None

**Wsign-compare**  
*Determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.*
**Syntax**

**Linux OS and macOS:**
-Wsign-compare
-Wno-sign-compare

**Windows OS:**
None

**Arguments**
None

**Default**
-Wno-sign-compare

The compiler does not issue these warnings

**Description**
This option determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.

On Linux* systems, this option is provided for compatibility with gcc.

**IDE Equivalent**
None

**Alternate Options**
None

---

**Wstrict-aliasing**

*Determines whether warnings are issued for code that might violate the optimizer’s strict aliasing rules.*

**Syntax**

**Linux OS and macOS:**
-Wstrict-aliasing
-Wno-strict-aliasing

**Windows OS:**
None

**Arguments**
None

**Default**
-Wno-strict-aliasing

No warnings are issued for code that might violate the optimizer’s strict aliasing rules.
**Description**
This option determines whether warnings are issued for code that might violate the optimizer’s strict aliasing rules. These warnings will only be issued if you also specify option `-ansi-alias` or option `-fstrict-aliasing`.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
ansi-alias, Qansi-alias
compiler option

**Wstrict-prototypes**
>Determines whether warnings are issued for functions declared or defined without specified argument types.

**Syntax**
Linux OS and macOS:
- `-Wstrict-prototypes`
- `-Wno-strict-prototypes`

Windows OS:
None

**Arguments**
None

**Default**
- `-Wno-strict-prototypes`

No warnings are issued for functions declared or defined without specified argument types.

**Description**
This option determines whether warnings are issued for functions declared or defined without specified argument types.

**IDE Equivalent**
None

**Alternate Options**
None

**Wtrigraphs**
>Determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.
**Syntax**

**Linux OS and macOS:**
- `-Wtrigraphs`
- `-Wno-trigraphs`

**Windows OS:**
None

**Arguments**
None

**Default**

- `-Wno-trigraphs`

No warnings are issued if any trigraphs are encountered that might change the meaning of the program.

**Description**

This option determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.

**IDE Equivalent**
None

**Alternate Options**
None

**Wuninitialized**

Determines whether a warning is issued if a variable is used before being initialized.

**Syntax**

**Linux OS and macOS:**
- `-Wuninitialized`
- `-Wno-uninitialized`

**Windows OS:**
None

**Arguments**
None

**Default**

- `-Wno-uninitialized`

No warning is issued if a variable is used before being initialized.

**Description**

This option determines whether a warning is issued if a variable is used before being initialized. Equivalent to `-ww592` and `-wd592`.
IDE Equivalent
None

Alternate Options
-ww592 and -wd592

Wunknown-pragmas
Determined whether a warning is issued if an unknown #pragma directive is used.

Syntax
Linux OS and macOS:
- Wunknown-pragmas
- Wno unknown-pragmas

Windows OS:
None

Arguments
None

Default
- Wunknown-pragmas

Description
A warning is issued if an unknown #pragma directive is used.

IDE Equivalent
None

Alternate Options
None

Wunused-function
Determined whether a warning is issued if a declared function is not used.

Syntax
Linux OS and macOS:
- Wunused-function
- Wno unused-function

Windows OS:
None

Arguments
None
**Default**

-`-Wno-unused-function`

No warning is issued if a declared function is not used.

**Description**

This option determines whether a warning is issued if a declared function is not used.

**IDE Equivalent**

None

**Alternate Options**

None

**Wunused-variable**

*Determine whether a warning is issued if a local or non-constant static variable is unused after being declared.*

**Syntax**

**Linux OS and macOS:**

-`-Wunused-variable`
-`-Wno-unused-variable`

**Windows OS:**

None

**Arguments**

None

**Default**

-`-Wno-unused-variable`

No warning is issued if a local or non-constant static variable is unused after being declared.

**Description**

This option determines whether a warning is issued if a local or non-constant static variable is unused after being declared.

**IDE Equivalent**

None

**Alternate Options**

None

**ww, Qww**

*Changes a soft diagnostic to a warning. This is a deprecated option. The replacement option is [Q]diag-warning.*
Syntax

Linux OS and macOS:

-wwLn[,Ln,...]

Windows OS:

/QwwLn[,Ln,...]

Arguments

Ln

Is the number of the diagnostic to be changed.

Default

OFF

The compiler returns soft diagnostics as usual.

Description

This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to an warning.

Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one Ln, each Ln must be separated by a comma.

IDE Equivalent

None

Alternate Options

Linux and macOS*: -diag-warning

Windows: /Qdiag-warning

Wwrite-strings

Issues a diagnostic message if const char * is converted to (non-const) char *.

Syntax

Linux OS and macOS:

-Wwrite-strings

Windows OS:

None

Arguments

None

Default

OFF

No diagnostic message is issued if const char * is converted to (non-const) char*. 
Description
This option issues a diagnostic message if const char* is converted to (non-const) char *.

IDE Equivalent
None

Alternate Options
None

Compatibility Options

clang-name
Specifies the name of the Clang compiler that should be used to set up the environment for C compilations.

Syntax

Linux OS and macOS:
-clang-name=name

Windows OS:
None

Arguments

name
Is the name of the Clang compiler to use. It can include the path where the Clang compiler is located.

Default
OFF
The compiler uses the PATH setting to find the Clang compiler and resolve environment settings.

Description
This option specifies the name of the Clang compiler that should be used to set up the environment for C compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful when you are referencing a non-standard Clang installation.

The C++ equivalent to option -clang-name is -clangxx-name.

NOTE
This option applies to the Intel compiler running in a CLANG environment. It does not apply to the Intel CLANG-based compiler.

IDE Equivalent
None

Alternate Options
None
**Example**

If the following option is specified, the compiler looks for the Clang compiler named `foobar` in the PATH setting:

```
-clang-name=foobar
```

If the following option is specified, the compiler looks for the Clang compiler named `foobar` in the path specified:

```
-clang-name=/a/b/foobar
```

**See Also**

`clangxx-name` compiler option

**clangxx-name**

Specifies the name of the Clang++ compiler that should be used to set up the environment for C++ compilations.

**Syntax**

- **Linux OS and macOS:**
  ```
  -clangxx-name=name
  ```

- **Windows OS:**
  None

**Arguments**

`name`  
Is the name of the Clang++ compiler to use. It can include the path where the Clang++ compiler is located.

**Default**

OFF  
The compiler uses the PATH setting to find the Clang++ compiler and resolve environment settings.

**Description**

This option specifies the name of the Clang++ compiler that should be used to set up the environment for C++ compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

The C equivalent to option `-clangxx-name` is `-clang-name`.

**NOTE**

This option applies to the Intel compiler running in a CLANG environment. It does not apply to the Intel CLANG-based compiler.

**IDE Equivalent**

None

**Alternate Options**

None
Example

If the following option is specified, the compiler looks for the Clang++ compiler named `foobar` in the PATH setting:

```bash
-clangxx-name=foobar
```

If the following option is specified, the compiler looks for the Clang++ compiler named `foobar` in the path specified:

```bash
-clangxx-name=/a/b/foobar
```

`clang-name` compiler option

fabi-version

`Instructs the compiler to select a specific ABI implementation.`

Syntax

**Linux OS and macOS:**

```bash
-fabi-version=n
```

**Windows OS:**

None

Arguments

- `n`  
  Is the ABI implementation. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Requests the latest ABI implementation.</td>
</tr>
<tr>
<td>1</td>
<td>Requests the ABI implementation used in gcc 3.2 and gcc 3.3.</td>
</tr>
<tr>
<td>2</td>
<td>Requests the ABI implementation used in gcc 3.4 and higher.</td>
</tr>
</tbody>
</table>

Default

Varies

The compiler uses the ABI implementation that corresponds to the installed version of gcc.

Description

This option tells the compiler to select a specific ABI implementation. This option is compatible with gcc option `-fabi-version`. If you have multiple versions of gcc installed, the compiler may change the value of `n` depending on which gcc is detected in your path.

**NOTE**

gcc 3.2 and 3.3 are not fully ABI-compliant, but gcc 3.4 is highly ABI-compliant.

**Caution**

Do not mix different values for `-fabi-version` in one link.
**IDE Equivalent**
Visual Studio: None  
Eclipse: **Preprocessor > gcc Compatibility Options**  
Xcode: None  

**Alternate Options**
None

---

**fms-dialect**

*Enables support for a language dialect that is compatible with Microsoft* Windows, while maintaining link compatibility with gcc.*

**Syntax**

**Linux OS:**

```
-fms-dialect [=ver]
```

**macOS:**

None

**Windows OS:**

None

**Arguments**

ver 

Indicates that the language dialect should be compatible with a certain version of Microsoft* Visual Studio. Possible values are:

- **14.1** Specifies the dialect should be compatible with Microsoft* Visual Studio 2017.
- **14** Specifies the dialect should be compatible with Microsoft* Visual Studio 2015.
- **12** Specifies the dialect should be compatible with Microsoft* Visual Studio 2013. This is the default if you do not specify `ver`.

**Default**

OFF 

The compiler does not support a language dialect that is compatible with Microsoft* Windows.

**Description**

This option enables support for a limited language dialect that is compatible with Microsoft* Windows, while maintaining link compatibility with gcc. It allows portability of code written on Windows* that uses Microsoft extensions or language features. The code will be compiled with syntax and semantics similar to that used by the Microsoft Windows compiler, while continuing to produce object files that are link-compatible with the object files and libraries produced by the gcc compiler and/or by the Intel compiler without this option.
The \texttt{-fms-dialect} option is intended to be used as an aid in porting code written on Windows*. It is not intended to enable an all-encompassing capability for porting all such code written on Windows seamlessly. For example, even with this option enabled, there remains a need to support gcc-compatible syntax and semantics for some language constructs in order to generate object files that are link-time compatible with those produced by the gcc compiler and/or by the Intel compiler without this option.

**IDE Equivalent**
None

**Alternate Options**
Linux and macOS*: None
Windows: /Qgcc-dialect

**See Also**
\texttt{Qgcc-dialect} compiler option

\textbf{gcc-name}

*Let you specify the name of the gcc compiler that should be used to set up the environment for C compilations.*

**Syntax**

**Linux OS:**

\texttt{-gcc-name=\textit{name}}

**macOS:**

None

**Windows OS:**

None

**Arguments**

\textit{name}

Is the name of the gcc compiler to use. It can include the path where the gcc compiler is located.

**Default**

OFF

The compiler uses the PATH setting to find the gcc compiler and resolve environment settings.

**Description**

This option lets you specify the name of the gcc compiler that should be used to set up the environment for C compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful when you are referencing a non-standard gcc installation, or you have multiple gcc installations on your system. The compiler will match gcc version values to the gcc compiler you specify.

The C++ equivalent to option \texttt{-gcc-name} is \texttt{-gxx-name}.

**IDE Equivalent**

Visual Studio: None
Eclipse: **Preprocessor > Nonstandard gcc Installation**

Xcode: None

**Alternate Options**

None

**Example**

If the following option is specified, the compiler looks for the gcc compiler named `foobar` in the PATH setting:

```
-gcc-name=foobar
```

If the following option is specified, the compiler looks for the gcc compiler named `foobar` in the path specified:

```
-gcc-name=/a/b/foobar
```

**See Also**

gxx-name compiler option

gnu-prefix

*Lets you specify a prefix that will be added to the names of gnu utilities called from the compiler.*

**Syntax**

**Linux OS:**

```
-gnu-prefix=prefix
```

**macOS:**

None

**Windows OS:**

None

**Arguments**

`prefix`

Is a string that prepends the name of gnu tools called from the compiler. The value depends on the gnu toolchain used for a particular operating system. For example, for Wind River* Linux 6.x, the `prefix` value will be `x86_64-wrs-linux-`. You must append a hyphen to `prefix` only if the toolchain prefix ends with a hyphen.

You can specify a short name or a pathname:

- **short name:** `-gnu-prefix=prefix`
  
  In this case, the compiler calls `prefix<gnu_utility>` instead of `<gnu_utility>`. The utility with this name should be in the PATH environment variable.

- **pathname:** `-gnu-prefix=/directory_name/prefix`
  
  In this case, the compiler calls `/directory_name/prefix<gnu_utility>`. The utility with this name will be invoked by its full pathname.
Default

OFF

The compiler calls gnu utilities by their short names, and looks for them in the path specified by the PATH environment variable.

Description

This option lets you specify a prefix that will be added to the names of gnu utilities called from the compiler. This option is available for Linux*-targeted compilers but the host may be either Windows* or Linux*.

If you specify option -gnu-prefix with option -gcc-name (or -gxx-name), the following occurs:

• If a name specified in -gcc-name (or -gxx-name) contains a full path to a binary then option -gnu-prefix has no effect on the specified name; other binutils will have the prefix.
• Otherwise, option -gnu-prefix is applied to the name specified in -gcc-name (or -gxx-name).

The above approach provides flexibility to specify an alternative gcc name outside of the default toolchain. At the same time, if a short name is provided in option -gcc-name, it is assumed to be a part of the default toolchain and a prefix will be added.

Instead of using option -gnu-prefix, you can create symlinks for the short names of gnu utilities in the toolchain and add them to the PATH. For example, ld--> i686-wrs-linux-gnu-ld.

NOTE

Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

Example

Consider that you are setting up the compiler to produce an application for a Wind River* Linux 6.

Assume that your gnu cross toolchain for the target operating system is located in the following directory:

/WRL/60/x86_64-linux/usr/bin/x86_64-wrs-linux

and gnu utilities in the toolchain have prefixx86_64-wrs-linux-.

Assume your sysroot for the target operating system is located in the following directory:

/WRL/60/qemux86-64

To compile your application for Wind River* Linux 6, you must enter the following commands:

export PATH=/WRL/60/x86_64-linux/usr/bin/x86_64-wrs-linux:PATH
icc --sysroot/WRL/60/qemux86-64 -gnu-prefix=x86_64-wrs-linux- app.c

The following examples show what happens when you specify both -gcc-name and -gnu-prefix.

Example 1:

Command line: -gcc-name=foobar -gnu-prefix=em64t-
Actual gcc name used in the compiler: em64t-foobar
ld name used in the icc: em64t-ld
Example 2:
Command line: -gcc-name=/a/b/foobar -gnu-prefix=em64t-
Actual gcc name used in the compiler: /a/b/foobar
ld name used in the icc: em64t-ld

See Also
gcc-name compiler option
gxx-name Compiler option
sysroot compiler option

gxx-name
Lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations.

Syntax
Linux OS:
-gxx-name=name
macOS:
None
Windows OS:
None

Arguments
name
Is the name of the g++ compiler to use. It can include the path where the g++ compiler is located.

Default
OFF
The compiler uses the PATH setting to find the g++ compiler and resolve environment settings.

Description
This option lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful if you have multiple gcc++ installations on your system. The compiler will match gcc++ version values to the gcc++ compiler you specify.

The C equivalent to option -gxx-name is -gcc-name.

NOTE
When compiling a C++ file with icc, g++ is used to get the environment.

IDE Equivalent
None
Alternate Options
None

Example
If the following option is specified, the compiler looks for the g++ compiler named foobar in the PATH setting:

- gxx-name=foobar

If the following option is specified, the compiler looks for the g++ compiler named foobar in the path specified:

- gxx-name=/a/b/foobar

See Also
gcc-name compiler option

/Qgcc-dialect
Enables support for a limited gcc-compatible dialect on Windows*.

Syntax
Linux OS and macOS:
None
Windows OS:
/Qgcc-dialect:ver

Arguments
ver

Indicates the version of the gcc compiler that the limited language dialect should be compatible with. It must be a three-digit number with a value of 440 or higher. The number will be normalized to reflect the gcc compiler version numbering scheme. For example, if you specify 450, it indicates gcc version 4.5.0.

Default
OFF

The compiler does not support a language dialect that is compatible with the gcc compiler.

Description
This option enables support for a limited gcc-compatible dialect on Windows*. It allows portability of code written for the gcc compiler.

This option enables a limited gnu-compatible compiler dialect on Windows. The code will be compiled with syntax and semantics similar to that used by gcc, while continuing to produce object files that are link-compatible with the object files and libraries on Windows (that is, object files and libraries produced by the Microsoft compiler and/or by the Intel compiler without this option).

The /Qgcc-dialect option is intended to be used as an aid in porting code written for the gcc compiler. It is not intended to enable an all-encompassing capability for porting all such code written for the gcc compiler seamlessly. For example, even with this option enabled, there remains a need to support Windows-
compatible syntax and semantics for some language constructs in order to generate object files that are link-time compatible with those produced by the Windows compiler and/or by the Intel compiler without this option.

**IDE Equivalent**
None

**Alternate Options**
Linux and macOS*: `-fms-dialect`

Windows: None

**See Also**

- `fms-dialect` compiler option

---

**Qms**

*Tells the compiler to emulate Microsoft compatibility bugs.*

**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

```
/Qms n
```

**Arguments**

`n`

Possible values are:

- **0**
  Instructs the compiler to disable some Microsoft compatibility bugs. It tells the compiler to emulate the fewest number of Microsoft compatibility bugs.

- **1**
  Instructs the compiler to enable most Microsoft compatibility bugs. It tells the compiler to emulate more Microsoft compatibility bugs than `/Qms0`.

- **2**
  Instructs the compiler to generate code that is Microsoft compatible. The compiler emulates the largest number of Microsoft compatibility bugs.

**Default**

```
/Qms1
```

The compiler emulates most Microsoft compatibility bugs.

**Description**

This option tells the compiler to emulate Microsoft compatibility bugs.

---

**Caution**

When using `/Qms0`, your program may not compile if it depends on Microsoft headers with compatibility bugs that are disabled with this option. Use `/Qms1` if your compilation fails.
Qvc

Specifies compatibility with Microsoft* Visual C++ or Microsoft* Visual Studio.

Syntax

Linux OS and macOS:
None

Windows OS:
/Qvc14.1
/Qvc14
/Qvc12

Arguments
None

Default

varies

When the compiler is installed, it detects which version of Visual Studio is on your system. Qvc defaults to the form of the option that is compatible with that version. When multiple versions of Visual Studio are installed, the compiler installation lets you select which version you want to use. In this case, Qvc defaults to the version you choose.

Description

This option specifies compatibility with Microsoft* Visual C++ or Microsoft* Visual Studio.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/Qvc14</td>
<td>Specifies compatibility with Microsoft* Visual Studio 2015.</td>
</tr>
<tr>
<td>/Qvc12</td>
<td>Specifies compatibility with Microsoft* Visual Studio 2013.</td>
</tr>
</tbody>
</table>

IDE Equivalent
None

Alternate Options
None
stdlib

Lets you select the C++ library to be used for linking.

Syntax

Linux OS:

None

macOS:

-stdlib[=keyword]

Windows OS:

None

Arguments

keyword

Is the function information to include. Possible values are:

- libc++
  Links using the libc++ library.
- libstdc++
  Links using the GNU libstdc++ library.

Default

-stdlib=libc++

The compiler links using the libc++ library.

Description

This option lets you select the C++ library to be used for linking. This option is processed by the command that initiates linking, adding library names explicitly to the link command.

Currently, if you do not specify this option, the libc++ headers and library are used.

NOTE

The IDE provides another possible setting for option -stdlib, which lets you choose the compiler default rather than a specific library.

IDE Equivalent

Visual Studio: None

Eclipse: None

Xcode: Language > C++ standard library > libstdc++

Language > C++ standard library > libc++

Language > C++ standard library > compiler-default

Alternate Options

None

vmv

Enables pointers to members of any inheritance type.
Syntax
Linux OS and macOS:
None
Windows OS:
/vmg

Arguments
None

Default
OFF

The compiler uses default rules to represent pointers to members.

Description
This option enables pointers to members of any inheritance type. To use this option, you must also specify option /vmg.

IDE Equivalent
None

Alternate Options
None

Linking or Linker Options

Bdynamic
Enables dynamic linking of libraries at run time.

Syntax
Linux OS:
-Bdynamic
macOS:
None
Windows OS:
None

Arguments
None

Default
OFF

Limited dynamic linking occurs.

Description
This option enables dynamic linking of libraries at run time. Smaller executables are created than with static linking.
This option is placed in the linker command line corresponding to its location on the user command line. It controls the linking behavior of any library that is passed using the command line.

All libraries on the command line following option `-Bdynamic` are linked dynamically until the end of the command line or until a `-Bstatic` option is encountered. The `-Bstatic` option enables static linking of libraries.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
- `-Bstatic` compiler option

**Bstatic**

Enables static linking of a user's library.

**Syntax**

**Linux OS:**
```
-Bstatic
```

**macOS:**
None

**Windows OS:**
None

**Arguments**
None

**Default**
OFF

Default static linking occurs.

**Description**

This option enables static linking of a user's library.

This option is placed in the linker command line corresponding to its location on the user command line. It controls the linking behavior of any library that is passed using the command line.

All libraries on the command line following option `-Bstatic` are linked statically until the end of the command line or until a `-Bdynamic` option is encountered. The `-Bdynamic` option enables dynamic linking of libraries.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
- `-Bdynamic` compiler option
**Bsymbolic**
* Binds references to all global symbols in a program to the definitions within a user's shared library.

**Syntax**

Linux OS:
- `-Bsymbolic`

macOS:
None

Windows OS:
None

**Arguments**
None

**Default**
OFF

When a program is linked to a shared library, it can override the definition within the shared library.

**Description**
This option binds references to all global symbols in a program to the definitions within a user's shared library.

This option is only meaningful on Executable Linkage Format (ELF) platforms that support shared libraries.

**Caution**
This option can have unintended side-effects of disabling symbol preemption in the shared library.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**

Bsymbolic-functions compiler option

**Bsymbolic-functions**
* Binds references to all global function symbols in a program to the definitions within a user's shared library.

**Syntax**

Linux OS:
- `-Bsymbolic-functions`
When a program is linked to a shared library, it can override the definition within the shared library.

Description
This option binds references to all global function symbols in a program to the definitions within a user's shared library.

This option is only meaningful on Executable Linkage Format (ELF) platforms that support shared libraries.

Caution
This option can have unintended side-effects of disabling symbol preemption in the shared library.

Bsymbolic compiler option

cxxlib
Determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.

Syntax
Linux OS:
-cxxlib[=dir]
-cxxlib-nostd
-no-cxxlib

macOS:
None

Windows OS:
None
Arguments

*dir*

Is an optional top-level location for the gcc binaries and libraries.

**Default**

C++: **-cxxlib**  
C: **-no-cxxlib**  

For C++, the compiler uses the run-time libraries and headers provided by gcc. For C, the compiler uses the default run-time libraries and headers and does not link to any additional C++ run-time libraries and headers. However, if you specify compiler option `-std=gnu++98`, the default is `-cxxlib`.

**Description**

This option determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.  

If you specify *dir* for cxxlib, the compiler uses *dir/bin/gcc* to setup the environment.  

Option `-cxxlib=dir` can be used with option `-gcc-name=name` to specify the location *dir/bin/name*.  

Option `-cxxlib-nostd` prevents the compiler from linking with the standard C++ library.

**IDE Equivalent**

Visual Studio: None  
Eclipse: **Preprocessor > gcc Compatibility Options**  
Xcode: None

**Alternate Options**

None

**See Also**

gcc-name compiler option

dynamic-linker

`Specifies a dynamic linker other than the default.`

**Syntax**

**Linux OS:**  
`-dynamic-linker file`

**macOS:**  
None

**Windows OS:**  
None

**Arguments**

*file*  
Is the name of the dynamic linker to be used.
Default
OFF

The default dynamic linker is used.

Description
This option lets you specify a dynamic linker other than the default.

IDE Equivalent
None

Alternate Options
None

dynamiclib
Invokes the libtool command to generate dynamic libraries.

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
None

macOS:
-dynamiclib

Windows OS:
None

Arguments
None

Default
OFF

The compiler produces an executable.

Description
This option invokes the libtool command to generate dynamic libraries.
When passed this option, the compiler uses the libtool command to produce a dynamic library instead of an executable when linking.
To build static libraries, you should specify option -staticlib or libtool -static <objects>.

IDE Equivalent
None

Alternate Options
None
See Also
staticlib
compiler option

F (Windows*)
Specifies the stack reserve amount for the program.

Syntax
Linux OS and macOS:
None

Windows OS:
/Fn
Arguments
n
Is the stack reserve amount. It can be specified as a decimal integer or as a hexadecimal constant by using a C-style convention (for example, /F0x1000).

Default
OFF
The stack size default is chosen by the operating system.

Description
This option specifies the stack reserve amount for the program. The amount (n) is passed to the linker.
Note that the linker property pages have their own option to do this.

IDE Equivalent
None

Alternate Options
None

F (macOS*)
Adds a framework directory to the head of an include file search path.

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
None

macOS:
-Fdir

Windows OS:
None
Arguments

dir

Is the name for the framework directory.

Default

OFF

The compiler does not add a framework directory to the head of an include file search path.

Description

This option adds a framework directory to the head of an include file search path.

IDE Equivalent

None

Alternate Options

None

fixed

_Causes the linker to create a program that can be loaded only at its preferred base address._

Syntax

Linux OS and macOS:

None

Windows OS:

/fixed

Arguments

None

Default

OFF

The compiler uses default methods to load programs.

Description

This option is passed to the linker, causing it to create a program that can be loaded only at its preferred base address.

IDE Equivalent

None

Alternate Options

None

Fm

_Tells the linker to generate a link map file. This is a deprecated option. There is no replacement option._
**Syntax**

**Linux OS and macOS:**

None

**Windows OS:**

/Fm[filename|dir]

**Arguments**

- **filename**: Is the name for the link map file.
- **dir**: Is the directory where the link map file should be placed. It can include `file`.

**Default**

OFF

No link map is generated.

**Description**

This option tells the linker to generate a link map.

**IDE Equivalent**

None

**Alternate Options**

None

**fuse-ld**  
*Tells the compiler to use a different linker instead of the default linker (ld).*

**Syntax**

**Linux OS and macOS:**

-fuse-ld=keyword

**Windows OS:**

None

**Arguments**

- **keyword**: Possible values are:
  - `bfd`: Tells the compiler to use the bfd linker.
  - `gold`: Tells the compiler to use the gold linker.

**Default**

Id

The compiler uses the Id linker by default.

**Description**

This option tells the compiler to use a different linker instead of default linker (ld).
This option is provided for compatibility with gcc.

**IDE Equivalent**
None

**Alternate Options**
None

**l**
*Tells the linker to search for a specified library when linking.*

**Syntax**

**Linux OS and macOS:**

`-lstring`

**Windows OS:**

None

**Arguments**

`string` Specifies the library (libstring) that the linker should search.

**Default**

OFF The linker searches for standard libraries in standard directories.

**Description**

This option tells the linker to search for a specified library when linking.

When resolving references, the linker normally searches for libraries in several standard directories, in directories specified by the `L` option, then in the library specified by the `l` option.

The linker searches and processes libraries and object files in the order they are specified. So, you should specify this option following the last object file it applies to.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**

`L` compiler option

**L**
*Tells the linker to search for libraries in a specified directory before searching the standard directories.*

**Syntax**

**Linux OS and macOS:**

`-Ldir`
**Windows OS:**
None

**Arguments**

- `dir`
  Is the name of the directory to search for libraries.

**Default**

OFF

The linker searches the standard directories for libraries.

**Description**

This option tells the linker to search for libraries in a specified directory before searching for them in the standard directories.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

1 compiler option

**LD**

Specifies that a program should be linked as a dynamic-link (DLL) library.

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**

- `/LD`
- `/LDd`

**Arguments**

None

**Default**

OFF

The program is not linked as a dynamic-link (DLL) library.

**Description**

This option specifies that a program should be linked as a dynamic-link (DLL) library instead of an executable (.exe) file. You can also specify `/LDd`, where `d` indicates a debug version.

**IDE Equivalent**

None
Alternate Options
None

**link**

*Passes user-specified options directly to the linker at compile time.*

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
/link

**Arguments**
None

**Default**
OFF

No user-specified options are passed directly to the linker.

**Description**

This option passes user-specified options directly to the linker at compile time.

All options that appear following /link are passed directly to the linker.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
Xlinker compiler option

**MD**

*Tells the linker to search for unresolved references in a multithreaded, dynamic-link run-time library.*

**Syntax**

**Linux OS and macOS:**
None

**Windows OS:**
/MD
/MDd

**Arguments**
None
Default

OFF The linker searches for unresolved references in a multi-threaded, static run-time library.

Description

This option tells the linker to search for unresolved references in a multithreaded, dynamic-link (DLL) run-time library. You can also specify /MDd, where d indicates a debug version.

This option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker.

IDE Equivalent

Visual Studio: Code Generation > Runtime Library
Eclipse: None
Xcode: None

Alternate Options

None

MT

Tells the linker to search for unresolved references in a multithreaded, static run-time library.

Syntax

Linux OS and macOS:
None

Windows OS:
/MT
/MTd

Arguments

None

Default

/MT The linker searches for unresolved references in a multithreaded, static run-time library.

Description

This option tells the linker to search for unresolved references in a multithreaded, static run-time library. You can also specify /MTd, where d indicates a debug version.

This option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker.

IDE Equivalent

Visual Studio: Code Generation > Runtime Library
Eclipse: None
Alternate Options
None

Qvc compiler option

no-libgcc
Prevents the linking of certain gcc-specific libraries.

Syntax
Linux OS:
-no-libgcc
macOS:
None
Windows OS:
None

Arguments
None

Default
OFF

Description
This option prevents the linking of certain gcc-specific libraries.
This option is not recommended for general use.

IDE Equivalent
None

Alternate Options
None

nodefaultlibs
Prevents the compiler from using standard libraries when linking.

Syntax
Linux OS and macOS:
-nodefaultlibs
Windows OS:
None
Arguments
None

Default
OFF
The standard libraries are linked.

Description
This option prevents the compiler from using standard libraries when linking. On Linux* systems, it is provided for GNU compatibility.

IDE Equivalent
Visual Studio: None
Eclipse: Libraries > Use no system libraries
Xcode: None

Alternate Options
None

See Also
nostdlib compiler option

nostartfiles
Prevents the compiler from using standard startup files when linking.

Syntax
Linux OS and macOS:

- nostartfiles

Windows OS:

None

Arguments
None

Default
OFF
The compiler uses standard startup files when linking.

Description
This option prevents the compiler from using standard startup files when linking.

IDE Equivalent
None

Alternate Options
None
See Also
nostdlib compiler option

nostdlib
Prevents the compiler from using standard libraries and startup files when linking.

Syntax
Linux OS and macOS:
   -nostdlib

Windows OS:
None

Arguments
None

Default
OFF
   The compiler uses standard startup files and standard libraries when linking.

Description
This option prevents the compiler from using standard libraries and startup files when linking. On Linux* systems, it is provided for GNU compatibility.
This option is not related to option -stdlib.

IDE Equivalent
None

Alternate Options
None

See Also
nodefaultlibs compiler option
nostartfiles compiler option

pie
Determines whether the compiler generates position-independent code that will be linked into an executable.

Syntax
Linux OS and macOS:
   -pie
   -no-pie

Windows OS:
None
Arguments
None

Default
On Linux* and on macOS* versions less than 10.7, the default is -no-pie. On macOS* 10.7 or greater, the default is -pie.

Description
This option determines whether the compiler generates position-independent code that will be linked into an executable. To enable generation of position-independent code that will be linked into an executable, specify -pie.

To disable generation of position-independent code that will be linked into an executable, specify -no-pie.

IDE Equivalent
None

Alternate Options
None

fpic
compiler option

 pthread
*Tells the compiler to use pthreads library for multithreading support.*

Syntax
Linux OS and macOS:
-pthread

Windows OS:
None

Arguments
None

Default
OFF
The compiler does not use pthreads library for multithreading support.

Description
Tells the compiler to use pthreads library for multithreading support.

IDE Equivalent
None

Alternate Options
None
shared

Tells the compiler to produce a dynamic shared object instead of an executable.

**Syntax**

Linux OS:
- `-shared`

macOS:
None

Windows OS:
None

**Arguments**

None

**Default**

OFF

The compiler produces an executable.

**Description**

This option tells the compiler to produce a dynamic shared object (DSO) instead of an executable. This includes linking in all libraries dynamically and passing `-shared` to the linker.

You must specify option `fpic` for the compilation of each object file you want to include in the shared library.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

dynamiclib compiler option
fpic compiler option
Xlinker compiler option

**shared-intel**

Causes Intel-provided libraries to be linked in dynamically.

**Syntax**

Linux OS and macOS:
- `-shared-intel`

Windows OS:
None

**Arguments**

None
Default
OFF

Intel® libraries are linked in statically, with the exception of Intel's OpenMP* runtime support library, which is linked in dynamically unless you specify option -qopenmp-link=static.

Description
This option causes Intel-provided libraries to be linked in dynamically. It is the opposite of -static-intel.

This option is processed by the ifort (icc/icpc) command that initiates linking, adding library names explicitly to the link command.

If you specify option -mcmodel=medium or -mcmodel=large, it sets option -shared-intel.

NOTE
On macOS* systems, when you set "Intel Runtime Libraries" to "Dynamic", you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

IDE Equivalent
Visual Studio: None
Eclipse: None
Xcode: Runtime > Intel Runtime Libraries

Alternate Options
None

See Also
static-intel compiler option
qopenmp-link compiler option

shared-libgcc
Links the GNU libgcc library dynamically.

Syntax
Linux OS:
-shared-libgcc

macOS:
None

Windows OS:
None

Arguments
None

Default
-shared-libgcc

The compiler links the libgcc library dynamically.
Description
This option links the GNU libgcc library dynamically. It is the opposite of option static-libgcc.

This option is processed by the ifort (icc/icpc) command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior of the static option, which causes all libraries to be linked statically.

IDE Equivalent
None

Alternate Options
None

See Also
static-libgcc compiler option

static
Prevents linking with shared libraries.

Syntax
Linux OS:
-static

macOS:
None

Windows OS:
None

Arguments
None

Default
OFF

The compiler links with shared libraries except as otherwise specified by -static-intel or its default.

Description
This option prevents linking with shared libraries. It causes the executable to link all libraries statically.

NOTE
This option does not cause static linking of libraries for which no static version is available, such as the OpenMP run-time libraries on Windows*. These libraries can only be linked dynamically.

IDE Equivalent
Visual Studio: None

Eclipse: Libraries > Link with static libraries
static-intel

Causes Intel-provided libraries to be linked in statically.

Syntax

Linux OS and macOS:
- `static-intel`

Windows OS:
None

Arguments

None

Default

ON

Intel® libraries are linked in statically, with the exception of Intel's OpenMP* runtime support library, which is linked in dynamically unless you specify option `-qopenmp-link=static`.

Description

This option causes Intel-provided libraries to be linked in statically with certain exceptions (see the Default above). It is the opposite of `-shared-intel`.

This option is processed by the icc/icpc command that initiates linking, adding library names explicitly to the link command.

If you specify option `-static-intel` while option `-mcmode=medium` or `-mcmode=large` is set, an error will be displayed.

If you specify option `-static-intel` and any of the Intel-provided libraries have no static version, a diagnostic will be displayed.

IDE Equivalent

Visual Studio: None
Eclipse: None
Xcode: Runtime > Intel Runtime Libraries

Alternate Options

None

See Also

`shared-intel` compiler option

**static-libgcc**

*Links the GNU libgcc library statically.*

**Syntax**

**Linux OS:**

- `-static-libgcc`

**macOS:**

None

**Windows OS:**

None

**Arguments**

None

**Default**

**OFF**

The compiler links the GNU *libgcc* library dynamically.

**Description**

This option links the GNU *libgcc* library statically. It is the opposite of option `-shared-libgcc`.

This option is processed by the `icc` or `icpc` command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior, which causes the library to be linked dynamically.

---

**NOTE**

If you want to use traceback, you must also link to the static version of the *libgcc* library. This library enables printing of backtrace information.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

`shared-libgcc` compiler option

`static-libstdc++` compiler option

**static-libstdc++**

*Links the GNU *libstdc++* library statically.*

**Syntax**

**Linux OS:**

- `-static-libstdc++`
**Description**
This option links the GNU libstdc++ library statically. This option is processed by the ifort (icc/icpc) command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior, which causes the library to be linked dynamically.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**
static-libgcc compiler option

**staticlib**
Invokes the libtool command to generate static libraries.

**Architecture Restrictions**
Not available when targeting Intel® Xeon Phi™ products

**Syntax**

**Linux OS:**
None

**macOS:**
- staticlib

**Windows OS:**
None

**Arguments**
None
Default
OFF
The compiler produces an executable.

Description
This option invokes the libtool command to generate static libraries. This option is processed by the command that initiates linking, adding library names explicitly to the link command.

When passed this option, the compiler uses the libtool command to produce a static library instead of an executable when linking.

To build dynamic libraries, you should specify option -dynamiclib or libtool -dynamic <objects>.

IDE Equivalent
None

Alternate Options
None

dynamiclib
compiler option

T
Tells the linker to read link commands from a file.

Syntax
Linux OS:
-T filename
macOS:
None
Windows OS:
None

Arguments
filename
Is the name of the file.

Default
OFF
The linker does not read link commands from a file.

Description
This option tells the linker to read link commands from a file.

IDE Equivalent
None

Alternate Options
None
u (Linux*)
*Tells the compiler the specified symbol is undefined.*

**Syntax**

**Linux OS and macOS:**

```
-u symbol
```

**Windows OS:**

None

**Arguments**

None

**Default**

OFF

| Standard rules are in effect for variables. |

**Description**

This option tells the compiler the specified symbol is undefined.

**IDE Equivalent**

None

**Alternate Options**

None

---

v

*Specifies that driver tool commands should be displayed and executed.*

**Syntax**

**Linux OS and macOS:**

```
-v [filename]
```

**Windows OS:**

None

**Arguments**

filename

Is the name of a source file to be compiled. A space must appear before the file name.

**Default**

OFF

| No tool commands are shown. |

**Description**

This option specifies that driver tool commands should be displayed and executed.

If you use this option without specifying a source file name, the compiler displays only the version of the compiler.
IDE Equivalent
None

Alternate Options
None

dryrun compiler option

**Wa**
*Passes options to the assembler for processing.*

**Syntax**

Linux OS and macOS:

```
-Wa,option1[,...]
```

Windows OS:
None

**Arguments**

*option*

Is an assembler option. This option is not processed by the driver and is directly passed to the assembler.

**Default**

OFF

No options are passed to the assembler.

**Description**

This option passes one or more options to the assembler for processing. If the assembler is not invoked, these options are ignored.

IDE Equivalent
None

Alternate Options
None

**Wl**
*Passes options to the linker for processing.*

**Syntax**

Linux OS and macOS:

```
-Wl,option1[,...]
```

Windows OS:
None
Arguments

option

Is a linker option. This option is not processed by the driver and is directly passed to the linker.

Default

OFF

No options are passed to the linker.

Description

This option passes one or more options to the linker for processing. If the linker is not invoked, these options are ignored.

This option is equivalent to specifying option `-Qoption,link,options`.

IDE Equivalent

None

Alternate Options

None

See Also

Qoption compiler option

Wp

Passes options to the preprocessor.

Syntax

Linux OS and macOS:

`-Wp,option1[,option2,...]`

Windows OS:

None

Arguments

option

Is a preprocessor option. This option is not processed by the driver and is directly passed to the preprocessor.

Default

OFF

No options are passed to the preprocessor.

Description

This option passes one or more options to the preprocessor. If the preprocessor is not invoked, these options are ignored.

This option is equivalent to specifying option `-Qoption,cpp,options`.

IDE Equivalent

None
Alternate Options
None

See Also
Qoption compiler option

Xlinker
*Passed a linker option directly to the linker.*

Syntax

**Linux OS and macOS:**

 `-Xlinker option`

**Windows OS:**

None

Arguments

`option`

Is a linker option.

Default

OFF

No options are passed directly to the linker.

Description

This option passes a linker option directly to the linker. If `-Xlinker -shared` is specified, only `-shared` is passed to the linker and no special work is done to ensure proper linkage for generating a shared object. `-Xlinker` just takes whatever arguments are supplied and passes them directly to the linker.

If you want to pass compound options to the linker, for example `"-L $HOME/lib"`, you must use the following method:

```
-Xlinker -L -Xlinker $HOME/lib
```

IDE Equivalent

Visual Studio: None

Eclipse: **Linker > Miscellaneous > Other Options**

Xcode: None

Alternate Options
None

See Also

shared compiler option

link compiler option

**Zi**

*Causes library names to be omitted from the object file.*
Syntax
Linux OS and macOS:
None

Windows OS:
/Zl

Arguments
None

Default
OFF

Description
Default or specified library names are included in the object file.

IDE Equivalent
Visual Studio: Advanced > Omit Default Library Names
Eclipse: None
Xcode: None

Alternate Options
None

Miscellaneous Options

bigobj
*Increases the number of sections that an object file can contain.*

Syntax
Linux OS and macOS:
None

Windows OS:
/bigobj

Arguments
None

Default
OFF

Description
An object file can hold up to 65,536 (2**16) addressable sections.

This option increases the number of sections that an object file can contain. It increases the address capacity to 4,294,967,296(2**32).
This option may be helpful for .obj files that can hold more sections, such as machine generated code or code that makes heavy use of template libraries.

**IDE Equivalent**
None

**Alternate Options**
None

dryrun
Specifies that driver tool commands should be shown but not executed.

**Syntax**

Linux OS and macOS:

```
-dryrun
```

Windows OS:
None

**Arguments**
None

**Default**
OFF

No tool commands are shown, but they are executed.

**Description**
This option specifies that driver tool commands should be shown but not executed.

**IDE Equivalent**
None

**Alternate Options**
None

**See Also**

v compiler option
dumpmachine
Displays the target machine and operating system configuration.

**Syntax**

Linux OS and macOS:

```
-dumpmachine
```

Windows OS:
None
Arguments
None

Default
OFF

The compiler does not display target machine or operating system information.

Description
This option displays the target machine and operating system configuration. No compilation is performed.

IDE Equivalent
None

Alternate Options
None

See Also
dumpversion compiler option

dumpversion
Displays the version number of the compiler.

Syntax
Linux OS and macOS:
-dumpversion

Windows OS:
None

Arguments
None

Default
OFF

The compiler does not display the compiler version number.

Description
This option displays the version number of the compiler. It does not compile your source files.

IDE Equivalent
None

Alternate Options
None

Example
Consider the following command:

```
icc -dumpversion
```

If the above is specified when using version 14.0 of the compiler, the compiler displays "14.0".
See Also
dumpmachine compiler option
global-hoist, Qglobal-hoist

Enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source.

Syntax

Linux OS and macOS:
- global-hoist
- no-global-hoist

Windows OS:
/Qglobal-hoist
/Qglobal-hoist-

Arguments

None

Default

- global-hoist
或其他/Qglobal-hoist

Certain optimizations are enabled that can move memory loads.

Description

This option enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source. In most cases, these optimizations are safe and can improve performance.

The negative form of the option is useful for some applications, such as those that use shared or dynamically mapped memory, which can fail if a load is moved too early in the execution stream (for example, before the memory is mapped).

IDE Equivalent

None

Alternate Options

None

Gy

Separates functions into COMDATs for the linker. This is a deprecated option. There is no replacement option.

Syntax

Linux OS and macOS:

None

Windows OS:

/Gy
Arguments
None

Default
ON

The compiler separates functions into COMDATs.

Description
This option tells the compiler to separate functions into COMDATs for the linker.

IDE Equivalent
Visual Studio: **Code Generation > Enable Function-Level Linking**
Eclipse: None
Xcode: None

Alternate Options
None

**help**
*Displays all available compiler options or a category of compiler options.*

Syntax

**Linux OS and macOS:**

- `help[category]`

**Windows OS:**

-/help[category]

Arguments

*category*

Is a category or class of options to display. Possible values are:

- **advanced**
  Displays advanced optimization options that allow fine tuning of compilation or allow control over advanced features of the compiler.

- **codegen**
  Displays Code Generation options.

- **compatibility**
  Displays options affecting language compatibility.

- **component**
  Displays options for component control.

- **data**
  Displays options related to interpretation of data in programs or the storage of data.

- **deprecated**
  Displays options that have been deprecated.

- **diagnostics**
  Displays options that affect diagnostic messages displayed by the compiler.
float Displays options that affect floating-point operations.
help Displays all the available help categories.
inline Displays options that affect inlining.
ipo Displays Interprocedural Optimization (IPO) options
language Displays options affecting the behavior of the compiler language features.
link Displays linking or linker options.
misc Displays miscellaneous options that do not fit within other categories.
openmp Displays OpenMP and parallel processing options.
opt Displays options that help you optimize code.
output Displays options that provide control over compiler output.
pgo Displays Profile Guided Optimization (PGO) options.
preproc Displays options that affect preprocessing operations.
reports Displays options for optimization reports.

Default OFF

No list is displayed unless this compiler option is specified.

Description
This option displays all available compiler options or a category of compiler options. If category is not specified, all available compiler options are displayed. On Linux* systems, this option can also be specified as --help.

IDE Equivalent
None

Alternate Options
Linux and macOS*: None
Windows: /?

intel-freestanding
Lets you compile in the absence of a gcc environment.

Syntax
Linux OS:
-intel-freestanding[=ver]
macOS:
None

Windows OS:
None

**Arguments**

*ver*

Is a three-digit number that is used to determine the gcc version that the compiler should be compatible with for compilation. It also sets the corresponding GNUC macros.

The number will be normalized to reflect the gcc compiler version numbering scheme. For example, if you specify 493, it indicates the compiler should be compatible with gcc version 4.9.3.

**Default**

OFF

The compiler uses default heuristics when choosing the gcc environment.

**Description**

This option lets you compile in the absence of a gcc environment. It disables any external compiler calls (such as calls to gcc) that the compiler driver normally performs by default.

This option also removes any default search locations for header and library files. So, for successful compilation and linking, you must provide these search locations.

This option does not affect ld, as, or cpp. They will be used for compilation as needed.

---

**NOTE**

This option does not imply option `-nostdinc -nostdlib`. If you want to assure a clean environment for compilation (including removal of Intel-specific header locations and libs), you should specify `-nostdinc` and/or `-nostdlib`.

---

**NOTE**

This option is supported for any Linux-target compiler, including a Windows-host to Linux-target compiler.

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

*intel-freestanding-target-os* compiler option

*nostdlib* compiler option

*nostdinc* compiler option, which is an alternate option for option X
**intel-freestanding-target-os**  
* Lets you specify the target operating system for compilation.

**Syntax**

**Linux OS:**

- `intel-freestanding-target-os=os`

**macOS:**

None

**Windows OS:**

None

**Arguments**

`os`  
Is the target operating system for the Linux compiler. Currently, the only possible value is `linux`.

**Default**

`OFF`  
The installed gcc determines the target operating system.

**Description**

This option lets you specify the target operating system for compilation. It sets option `-intel-freestanding`.

---

**NOTE**

This option is supported for any Linux-target compiler, including a Windows-host to Linux-target compiler.

---

**IDE Equivalent**

None

**Alternate Options**

None

**See Also**

intel-freestanding compiler option

**MP-force**

* Disables the default heuristics used when compiler option `/MP` is specified. This lets you control the number of processes spawned.

**Syntax**

**Linux OS and macOS:**

None
Windows OS:
/MP-force

Arguments
None

Default
OFF

Description
Default heuristics are used when option /MP is specified.

Description
This option disables the default heuristics used when compiler option /MP:n is specified. You must specify it when you specify option /MP:n.

Option /MP:n sets the maximum number of processes that can be used to compile large numbers of source files at the same time. However, default heuristics may cause the number of processes to be less than specified.

Option /MP-force ensures that n will be the maximum number of processes spawned regardless of other heuristics which may limit the number of processes.

IDE Equivalent
None

Alternate Options
None

See Also
multiple-processes, MP compiler option
multibyte-chars, Qmultibyte-chars
Determined whether multi-byte characters are supported.

Syntax
Linux OS and macOS:
-multibyte-chars
-no-multibyte-chars

Windows OS:
/Qmultibyte-chars
/Qmultibyte-chars-

Arguments
None

Default
-multibyte-charsor /Qmultibyte-chars

Multi-byte characters are supported.
Description
This option determines whether multi-byte characters are supported.

IDE Equivalent
Visual Studio: None
Eclipse: Language > Support Multibyte Characters in Source
Xcode: Language > Support Multibyte Characters in Source

Alternate Options
None

multiple-processes, MP
Creates multiple processes that can be used to compile large numbers of source files at the same time.

Syntax
Linux OS and macOS:
-multiple-processes[=n]
Windows OS:
/MP[:n]

Arguments
n Is the maximum number of processes that the compiler should create.

Default
OFF A single process is used to compile source files.

Description
This option creates multiple processes that can be used to compile large numbers of source files at the same time. It can improve performance by reducing the time it takes to compile source files on the command line.

This option causes the compiler to create one or more copies of itself, each in a separate process. These copies simultaneously compile the source files.

If n is not specified for this option, the default value is as follows:

- On Windows* systems, the value is based on the setting of the NUMBER_OF_PROCESSORS environment variable.
- On Linux* and macOS* systems, the value is 2.

This option applies to compilations, but not to linking or link-time code generation.

To override default heuristics, specify option /MP-force. It ensures that n will be the maximum number of processes created regardless of other heuristics that may limit the number of processes.

IDE Equivalent
Visual Studio: General > Multi-processor Compilation
Eclipse: None
Xcode: None
Alternate Options
None

See Also
MP-force compiler option

nologo
Tells the compiler to not display compiler version information.

Syntax
Linux OS and macOS:
None

Windows OS:
/nologo

Arguments
None

Default
OFF

Description
Tells the compiler to not display compiler version information.

IDE Equivalent
Visual Studio: General > Suppress Startup Banner
Eclipse: None
Xcode: None

Alternate Options
None

print-sysroot
Prints the target sysroot directory that is used during compilation.

Architecture Restrictions
Not available when targeting Intel® Xeon Phi™ products

Syntax
Linux OS:
-print-sysroot
macOS:
None
Windows OS:
None

Arguments
None

Default
OFF Nothing is printed.

Description
This option prints the target sysroot directory that is used during compilation.
This is the target sysroot directory that is specified in an environment file or in option --sysroot. This option is only effective if a target sysroot has been specified.
This option is provided for compatibility with gcc.

NOTE
Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent
None

Alternate Options
None

See Also
sysroot compiler option

save-temps, Qsave-temps
Tells the compiler to save intermediate files created during compilation.

Syntax
Linux OS and macOS:
-ssave-temps
-no-save-temps

Windows OS:
/Qsave-temps
/Qsave-temps-

Arguments
None
**Default**

Linux* and macOS* systems: 
-no-save-temps
Windows* systems: .obj files are saved

On Linux and macOS* systems, the compiler deletes intermediate files after compilation is completed. On Windows systems, the compiler saves only intermediate object files after compilation is completed.

**Description**

This option tells the compiler to save intermediate files created during compilation. The names of the files saved are based on the name of the source file; the files are saved in the current working directory.

If option [Q]save-temps is specified, the following occurs:

- The object .o file (Linux and macOS*) or .obj file (Windows) is saved.
- The assembler .s file (Linux and macOS*) or .asm file (Windows) is saved if you specified the [Q]use-asm option.

If -no-save-temps is specified on Linux or macOS* systems, the following occurs:

- The .o file is put into /tmp and deleted after calling ld.
- The preprocessed file is not saved after it has been used by the compiler.

If /Qsave-temps- is specified on Windows systems, the following occurs:

- The .obj file is not saved after the linker step.
- The preprocessed file is not saved after it has been used by the compiler.

**NOTE**

This option only saves intermediate files that are normally created during compilation.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

If you compile program my_foo.c on a Linux or macOS* system and you specify option -save-temps and option -use-asm, the compilation will produce files my_foo.o and my_foo.s.

If you compile program my_foo.c on a Windows system and you specify option /Qsave-temps and option /Quse-asm, the compilation will produce files my_foo.o and my_foo.asm.

**showIncludes**

*Tells the compiler to display a list of the include files.*

**Syntax**

Linux OS and macOS:

None

Windows OS:

/showIncludes
**Arguments**
None

**Default**
OFF

The compiler does not display a list of the include files.

**Description**
This option tells the compiler to display a list of the include files. Nested include files (files that are included from the files that you include) are also displayed.

**IDE Equivalent**
Visual Studio: *Advanced > Show Includes*
Eclipse: None
Xcode: None

**Alternate Options**
None

**sox**
*Tell the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions.*

**Syntax**

**Linux OS:**
-sox[=keyword[,keyword]]
-no-sox

**macOS:**
None

**Windows OS:**
None

**Arguments**

*keyword*

**Is the function information to include. Possible values are:**

**inline**
Includes a list of the functions that were inlined in each object.

**profile**
Includes a list of the functions that were compiled with the `-prof-use` option and for which the .dpi file had profile information, and an indication for each as to whether the profile information was USED (matched) or IGNORED (mismatched).
**Default**

-no-sox

The compiler does not save these informational strings in the object file.

**Description**

This option tells the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions. The information is embedded as a string in each object file or assembly output.

If you specify option sox with no keyword, the compiler saves the compiler options and version number used in the compilation of the objects that make up the executable.

When you specify this option, the size of the executable on disk is increased slightly. Each keyword you specify increases the size of the executable. When you link the object files into an executable file, the linker places each of the information strings into the header of the executable. It is then possible to use a tool, such as a strings utility, to determine what options were used to build the executable file.

**IDE Equivalent**

None

**Alternate Options**

None

**Example**

The following commands are equivalent:

- sox=profile -sox=inline
- sox=profile,inline

You can use the negative form of the option to disable and reset the option. For example:

- sox=profile -no-sox -sox=inline ! This means -sox=inline

**See Also**

prof-use, Qprof-use compiler option

**sysroot**

Specifies the root directory where headers and libraries are located.

**Architecture Restrictions**

Not available when targeting Intel® Xeon Phi™ products

**Syntax**

**Linux OS:**

--sysroot=dir

**macOS:**

None

**Windows OS:**

None
Arguments

\textit{dir} \hspace{1cm} Specifies the local directory that contains copies of target libraries in the corresponding subdirectories.

Default

Off \hspace{1cm} The compiler uses default settings to search for headers and libraries.

Description

This option specifies the root directory where headers and libraries are located. For example, if the headers and libraries are normally located in \texttt{/usr/include} and \texttt{/usr/lib} respectively, \texttt{--sysroot=/mydir} will cause the compiler to search in \texttt{/mydir/usr/include} and \texttt{/mydir/usr/lib} for the headers and libraries.

This option is provided for compatibility with gcc.

\textbf{NOTE}

Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

V
Displays the compiler version information.

Syntax

Linux OS and macOS:
–V

Windows OS:
/QV

Arguments

None

Default

OFF The compiler version information is not displayed.

Description

This option displays the startup banner, which contains the following compiler information:

• The name of the compiler and its applicable architecture
• The major and minor version of the compiler, the update number, and the package number (for example, Version 12.1.0.047)
• The specific build and build date (for example, Build <builddate>)
• The copyright date of the software

This option can be placed anywhere on the command line.

**IDE Equivalent**

Visual Studio: None

Eclipse: **General > Show Startup Banner**

Xcode: **General > Show Startup Banner**

**Alternate Options**

None

**version**

*Tell the compiler to display GCC-style version information.*

**Syntax**

**Linux OS and macOS:**

```--version```

**Windows OS:**

None

**Arguments**

None

**Default**

OFF

**Description**

Tell the compiler to display GCC-style version information.

**IDE Equivalent**

None

**Alternate Options**

None

**watch**

*Tell the compiler to display certain information to the console output window.*

**Syntax**

**Linux OS and macOS:**

```-watch[=keyword[, keyword...]]```

```-nowatch```
Windows OS:
/watch[:keyword[, keyword...]]

/nowatch

**Arguments**

*keyword* Determines what information is displayed. Possible values are:

- *none* Disables *cmd* and *source*.
- *[no]cmd* Determines whether driver tool commands are displayed and executed.
- *[no]source* Determines whether the name of the file being compiled is displayed.
- *mic-cmd* Enables display of compiler options that are passed to the offload compilation. This keyword is only available when targeting Intel® Xeon Phi™ products.
- *all* Enables *cmd* and *source*.

**Default**

*nowatch* Pass information and source file names are not displayed to the console output window.

**Description**

Tells the compiler to display processing information (pass information and source file names) to the console output window.

Portability Options

A challenge in porting applications from one compiler to another is making sure there is support for the compiler options you use to build your application. The Intel® C++ Compiler supports many of the options that are valid on other compilers you may be using.

The following sections list compiler options that are supported by the Intel® C++ Compiler and the following:

- Microsoft* C++ compiler
- gcc* Compiler

Options that are unique to either compiler are not listed in these sections.

Options Equivalent to Microsoft* C++ Options (Windows*)

The following table lists compiler options that are supported by both the Intel® C++ Compiler and the Microsoft* C++ compiler.

For complete details about these options, for example, the possible values for <n> when it appears below, see the Microsoft Visual Studio* C++ documentation.

GCC-Compatible Warning Options

The Intel® C++ compiler recognizes many gcc-compatible warning options, but we do not document all of them.

In general, if a gcc-compatible option is accepted by the compiler, but not documented, the implementation of the option is the same as described in the gcc documentation.

To find the gcc documentation about gcc warning options, you can do any of the following:

- Check the gcc website (http://gcc.gnu.org/onlinedocs/gcc/)
- On Linux*, enter the command `man gcc`
- Search the web for "gcc warning options"

Floating-Point Operations

Understanding Floating-Point Operations

Programming Tradeoffs in Floating-Point Applications

In general, the programming objectives for floating-point applications fall into the following categories:
- **Accuracy**: The application produces results that are close to the correct result.
- **Reproducibility and portability**: The application produces consistent results across different runs, different sets of build options, different compilers, different platforms, and different architectures.
- **Performance**: The application produces fast, efficient code.

Based on the goal of an application, you will need to make tradeoffs among these objectives. For example, if you are developing a 3D graphics engine, performance may be the most important factor to consider, with reproducibility and accuracy as secondary concerns.

The Intel® C++ Compiler provides several compiler options that allow you to tune your applications based on specific objectives. Broadly speaking, there are the floating-point specific options, such as the `-fp-model` (Linux* and macOS*) or `/fp` (Windows*) option, and the fast-but-low-accuracy options, such as the `Q`imf-max-error option. The compiler optimizes and generates code differently when you specify these different compiler options. Select appropriate compiler options by carefully balancing your programming objectives and making tradeoffs among these objectives. Some of these options may influence the choice of math routines that are invoked.

Many routines in the `libirc`, `libm`, and `svml` library are more highly optimized for Intel microprocessors than for non-Intel microprocessors.

### Using Floating-Point Options

Take the following code as an example:

```c
float t0, t1, t2;
...
t0 = t1 + t2 + 4.0f + 0.1f;
```

If you specify the `-fp-model extended` (Linux* and macOS*) or `/fp:extended` (Windows*) option in favor of accuracy, the compiler generates the following assembly code:

```assembly
fld    DWORD PTR _t1
fadd   DWORD PTR _t2
fadd   DWORD PTR _Cnst4.0
fadd   DWORD PTR _Cnst0.1
fstp   DWORD PTR _t0
```

This code maximizes accuracy because it utilizes the highest mantissa precision available on the target platform. The code performance might suffer when managing the x87 stack, and it might yield results that cannot be reproduced on other platforms that do not have an equivalent extended precision type.

If you specify the `-fp-model source` (Linux* and macOS*) or `/fp:source` (Windows*) option in favor of reproducibility and portability, the compiler generates the following assembly code:

```assembly
movss  xmm0, DWORD PTR _t1
addss  xmm0, DWORD PTR _t2
addss  xmm0, DWORD PTR _Cnst4.0
addss  xmm0, DWORD PTR _Cnst0.1
movss  DWORD PTR _t0, xmm0
```

This code maximizes portability by preserving the original order of the computation, and by using the IEEE single-precision type for all computations. It is not as accurate as the previous implementation, because the intermediate rounding error is greater compared to extended precision. It is not the highest performance implementation, because it does not take advantage of the opportunity to pre-compute 4.0f + 0.1f.
If you specify the `-fp-model fast` (Linux* and macOS*) or `/fp:fast` (Windows*) option in favor of performance, the compiler generates the following assembly code:

```
movss     xmm0, DWORD PTR _Cnst4.1
addss     xmm0, DWORD PTR _t1
addss     xmm0, DWORD PTR _t2
movss     DWORD PTR _t0, xmm0
```

This code maximizes performance using Intel® Streaming SIMD Extensions (Intel® SSE) instructions and pre-computing 4.0f + 0.1f. It is not as accurate as the first implementation, due to the greater intermediate rounding error. It does not provide reproducible results like the second implementation, because it must reorder the addition to pre-compute 4.0f + 0.1f. All compilers, on all platforms, at all optimization levels do not reorder the addition in the same way.

For many other applications, the considerations may be more complicated.

**Using Fast-But-Low-Accuracy Options**

The fast-but-low-accuracy options provide an easy way to control the accuracy of mathematical functions and utilize performance/accuracy tradeoffs offered by the Intel® Math Kernel Library (Intel® MKL). You can specify accuracy, via a command line interface, for all math functions or a selected set of math functions at the level more precise than low, medium, or high.

You specify the accuracy requirements as a set of function attributes that the compiler uses for selecting an appropriate function implementation in the math libraries. Examples using the attribute, `max-error`, are presented here. For example, use the following option to specify the relative error of two ULPs for all single, double, long double, and quad precision functions:

```
-fimf-max-error=2
```

To specify twelve bits of accuracy for a `sin` function, use:

```
-fimf-accuracy-bits=12:sin
```

To specify relative error of ten ULPs for a `sin` function, and four ULPs for other math functions called in the source file you are compiling, use:

```
-fimf-max-error=10:sin -fimf-max-error=4
```

The Intel® C++ Compiler defines the default value for the `max-error` attribute depending on the `/fp` option and `/Qfast-transcendentals` settings. In `/fp:fast` mode, or if fast but less accurate math functions are explicitly enabled by `/Qfast-transcendentals-`, then the Intel® C++ Compiler sets a `max-error=4.0` for the call. Otherwise, it sets a `max-error=0.6`.

**Dispatching of Math Routines**

The Intel® C++ Compiler optimizes calls to routines from the `libm` and `svml` libraries into direct CPU-specific calls, when the compilation configuration specifies the target CPU where the code is tuned, and if the set of instructions available for the code compilation is not narrower than the set of instructions available in the tuning target CPU.

For example:

- The code containing calls to the `exp()` library function and compiled with `-mtune=corei7-avx` (specifies tuning target CPU that supports Intel® Advanced Vector Extensions (Intel® AVX)) and `-QxCORE-AVX2/-march=core-avx2` (specifies Intel® Advanced Vector Extensions 2 (Intel® AVX2) instructions set) call the `exp()` routine that is optimized for processors with Intel® AVX support. This code provides the best performance for these processors.
The same code, compiled with `-mtune=core-avx2` and `-QxAVX/-march=corei7-avx`, calls a library dispatch routine that picks the optimal CPU specific version of the `exp()` routine in runtime. Dispatching cannot be avoided because the instruction set does not allow the use of Intel® AVX2. Dynamic dispatching provides the best performance with the Intel® AVX2 CPU.

In the second example, if some portions of code extend the available instructions set by the means of `_allow_cpu_features()/_may_i_use_cpu_feature()` intrinsics, then the compiler might produce direct calls to Intel® AVX2 specific versions of `exp()`.

The dispatching optimization applies to the `exp()` routine, and to the other math routines with CPU specific implementations in the libraries. The dispatching optimization can be disabled using the `-[f|Q]imf-force-dynamic-target` option. This option specifies a list of math routines that are improved with a dynamic dispatcher. (See the Intel® C++ Compiler documentation for syntax examples.)

`fimf-max-error, Qimf-max-error` compiler option

### Floating-point Optimizations

Application performance is an important goal of the Intel® C++ Compiler, even at default optimization levels. A number of optimizations involve transformations that might affect the floating-point behavior of the application, such as evaluation of constant expressions at compile time, hoisting invariant expressions out of loops, or changes in the order of evaluation of expressions. These optimizations usually help the compiler to produce the most efficient code possible. However, the optimizations might be contrary to the floating-point requirements of the application.

Some optimizations are not consistent with strict interpretation of the ANSI or ISO standards for C and C++. Such optimizations can cause differences in rounding and small variations in floating-point results that may be more or less accurate than the ANSI-conformant result.

The Intel® C++ Compiler provides the `-fp-model (Linux* and macOS*) or /fp (Windows*)` option, which allows you to control the optimizations performed when you build an application. The option allows you to specify the compiler rules for:

- **Value safety**: Whether the compiler may perform transformations that could affect the result. For example, in the SAFE mode, the compiler won't transform `x/x` to 1.0 because the value of `x` at runtime might be a zero or a NaN. The UNSAFE mode is the default.
- **Floating-point expression evaluation**: How the compiler should handle the rounding of intermediate expressions. For example, when double precision is specified, the compiler interprets the statement `t0=4.0f+0.1f+t1+t2;` as `t0=(float)(4.1+(double)t1+(double)t2);`
- **Floating-point contractions**: Whether the compiler should generate fused multiply-add (FMA) instructions on processors that support them. When enabled, the compiler may generate FMA instructions for combining multiply and add operations; when disabled, the compiler must generate separate multiply and add instructions with intermediate rounding.
- **Floating-point environment access**: Whether the compiler must account for the possibility that the program might access the floating-point environment, either by changing the default floating-point control settings or by reading the floating-point status flags. This is disabled by default. You can use the `-fp-model:strict (Linux* and macOS*) /fp:strict (Windows*)` option to enable it.
- **Precise floating-point exceptions**: Whether the compiler should account for the possibility that floating-point operations might produce an exception. This is disabled by default. You can use `-fp-model:strict (Linux* and macOS*) or /fp:strict (Windows*); or `-fp-model:except (Linux* and macOS*) or /fp:except (Windows*) to enable it.

Consider the following example:

```cpp
double a=1.5; int x=0; ...
__try {
    int t0=a; //raises inexact
    x=1;
    a*=2;
```
Without precise floating-point exceptions, the result is `SEH Exception: x=1`; with precision floating-point exceptions, the result is `SEH Exception: x=0`.

The following table describes the impact of different keywords of the option on compiler rules and optimizations:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Value Safety</th>
<th>Floating-Point Expression Evaluation</th>
<th>Floating-Point Contractions</th>
<th>Floating-Point Environment Access</th>
<th>Precise Floating-Point Exceptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>precise source double extended</td>
<td>Safe</td>
<td>Varies Source Double Extended</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>strict</td>
<td>Safe</td>
<td>Varies</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>consistent</td>
<td>Safe</td>
<td>Varies</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>fast=1 (default)</td>
<td>Unsafe</td>
<td>Unknown</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
<tr>

<td>Yes</td>
</tr>
<tr>
<td>except-</td>
<td>Unaffected</td>
<td>Unaffected</td>
<td>Unaffected</td>
<td>Unaffected</td>
<td>No</td>
</tr>
</tbody>
</table>

**NOTE**

It is illegal to specify the `except` keyword in an unsafe safety mode.

Based on the objectives of an application, you can choose to use different sets of compiler options and keywords to enable or disable certain optimizations, so that you can get the desired result.

**See Also**

Using `-fp-model (/fp)` Option

**Using the `-fp-model (/fp)` Option**

The `-fp-model (Linux* and macOS*)` or `/fp (Windows*)` option allows you to control the optimizations on floating-point data. You can use this option to tune the performance, level of accuracy, or result consistency for floating-point applications across platforms and optimization levels.

For applications that do not require support for denormalized numbers, the `-fp-model` or `/fp` option can be combined with the `[Q]ftz` option to flush denormalized results to zero in order to obtain improved runtime performance on processors based on all Intel® architectures.

You can use keywords to specify the semantics to be used. The keywords specified for this option may influence the choice of math routines that are invoked. Many routines in the `libirc`, `libm`, and `libsymm` libraries are more highly optimized for Intel microprocessors than for non-Intel microprocessors. Possible values of the keywords are as follows:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>precise</td>
<td>Enables value-safe optimizations on floating-point data.</td>
</tr>
</tbody>
</table>
### Keyword | Description
--- | ---
fast[=1|2] | Enables more aggressive optimizations on floating-point data.
consistent | Enables consistent, reproducible results for different optimization levels or between different processors of the same architecture. This setting is equivalent to the use of the following options:
  - Windows*: /fp:precise /Qfma- /Qimf-arch-consistency:true
  - Linux* and macOS*: -fp-model precise -no-fma -fimf-arch-consistency=true
strict | Enables precise and except, disables contractions, and enables pragma stdc fenv_access.
source | Rounds intermediate results to source-defined precision and enables value-safe optimizations.
double | Rounds intermediate results to 53-bit (double) precision and enables value-safe optimizations.
extended | Rounds intermediate results to 64-bit (extended) precision and enables value-safe optimizations.
[no-]except (Linux* and macOS*) or except[-] (Windows*) | Determines whether strict floating-point exception semantics are used.

The default value of the option is `-fp-model fast=1` or `/fp:fast=1`, which means that the compiler uses more aggressive optimizations on floating-point calculations.

**NOTE**
Using the default option keyword `-fp-model fast` or `/fp:fast`, you may get significant differences in your result depending on whether the compiler uses x87 or SSE/AVX instructions to implement floating-point operations. Results are more consistent when the other option keywords are used.

Several examples are provided to illustrate the usage of the keywords. These examples show:
- A small example of source code.

**NOTE**
The same source code is considered in all the included examples.

- The semantics that are used to interpret floating-point calculations in the source code.
- One or more possible ways the compiler may interpret the source code.

**NOTE**
There are several ways the compiler may interpret the code; we show just some of these possibilities.

### -fp-model fast or /fp:fast

Example source code:
When this option is specified, the compiler applies the following semantics:

- Additions may be performed in any order.
- Intermediate expressions may use single, double, or extended double precision.
- The constant addition may be pre-computed, assuming the default rounding mode.

Using these semantics, some possible ways the compiler may interpret the original code are given below:

**Example**

```c
float t0, t1, t2;
...
t0 = 4.0f + 0.1f + t1 + t2;
```

- **-fp-model extended or /fp:extended**

This setting is equivalent to **-fp-model precise** on Linux* operating systems based on the IA-32 architecture.

Example source code:

```c
float t0, t1, t2;
...
t0 = (float)((double)t1 + (double)t2) + 4.1f;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order
- Intermediate expressions use extended double precision
- The constant addition may be pre-computed, assuming the default rounding mode

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```c
float t0, t1, t2;
...
t0 = (float)(((long double)4.1 + (long double)t1) + (long double)t2);
```

- **-fp-model source or /fp:source**

This setting is equivalent to **-fp-model precise or /fp:precise** on systems based on the Intel® 64 architecture.
When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order.
- Intermediate expressions use the precision specified in the source code, that is, single-precision.
- The constant addition may be pre-computed, assuming the default rounding mode.

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```c
float t0, t1, t2;
...
t0 = 4.0f + 0.1f + t1 + t2;
```

### -fp-model double or /fp:double

This setting is equivalent to `-fp-model precise or /fp:precise` on Windows systems based on the IA-32 architecture.

Example source code:

```c
float t0, t1, t2;
...
t0 = (4.1f + t1) + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order.
- Intermediate expressions use double precision.
- The constant addition may be pre-computed, assuming the default rounding mode.

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```c
float t0, t1, t2;
...
t0 = ((double)4.1 + (double)t1) + (double)t2;
```

### -fp-model strict or /fp:strict

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order.
- Expression evaluation matches expression evaluation under keyword `precise`.
- The constant addition is not pre-computed because there is no way to tell what rounding mode will be active when the program runs.

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```c
float t0, t1, t2;
...
t0 = 4.0f + 0.1f + t1 + t2;
```
Example

```c
float t0, t1, t2;
...
t0 = (float)(((long double)4.0f + (long double)0.1f) + (long double)t1) + (long double)t2);
```

Denormal Numbers

A normalized number is a number for which both the exponent (including bias) and the most significant bit of the mantissa are non-zero. For such numbers, all the bits of the mantissa contribute to the precision of the representation.

The smallest normalized single-precision floating-point number greater than zero is about 1.1754943\(^{-38}\). Smaller numbers are possible, but those numbers must be represented with a zero exponent and a mantissa whose leading bit(s) are zero, which leads to a loss of precision. These numbers are called denormalized numbers or denormals (newer specifications refer to these as subnormal numbers).

Denormal computations use hardware and/or operating system resources to handle denormals; these can cost hundreds of clock cycles. Denormal computations take much longer to calculate than normal computations.

There are several ways to avoid denormals and increase the performance of your application:

- Scale the values into the normalized range.
- Use a higher precision data type with a larger range.
- Flush denormals to zero.

Institute of Electrical and Electronics Engineers, Inc*. (IEEE) web site for information about the current floating-point standards and recommendations

Floating-Point Environment

The floating-point environment is a collection of registers that control the behavior of the floating-point machine instructions and indicate the current floating-point status. The floating-point environment can include rounding mode controls, exception masks, flush-to-zero (FTZ) controls, exception status flags, and other floating-point related features.

For example, bit 15 of the MXCSR register enables the flush-to-zero mode, which controls the masked response to an single-instruction multiple-data (SIMD) floating-point underflow condition.

The floating-point environment affects most floating-point operations; therefore, correct configuration to meet your specific needs is important. For example, the exception mask bits define which exceptional conditions will be raised as exceptions by the processor. In general, the default floating-point environment is set by the operating system. You don’t need to configure the floating-point environment unless the default floating-point environment does not suit your needs.

There are several methods available if you want to modify the default floating-point environment. For example, you can use inline assembly, compiler built-in functions, library functions, or command line options.

Changing the default floating-point environment affects runtime results only. This does not affect any calculations that are pre-computed at compile time.
If strict reproducibility and consistency are important do not change the floating point environment without also using either `-fp-model strict` (Linux* or macOS*) or `/fp:strict` (Windows*) option or `pragma fenv_access`.

**Setting the FTZ and DAZ Flags**

In Intel® processors, the flush-to-zero (FTZ) and denormals-are-zero (DAZ) flags in the MXCSR register are used to control floating-point calculations. Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) instructions, including scalar and vector instructions, benefit from enabling the FTZ and DAZ flags. Floating-point computations using the Intel® SSE and Intel® AVX instructions are accelerated when the FTZ and DAZ flags are enabled. This improves the application's performance.

Use the [Q]ftz option to flush denormal results to zero when the application is in the gradual underflow mode. This option may improve performance if the denormal values are not critical to the application's behavior. The [Q]ftz option, when applied to the main program, sets the FTZ and the DAZ hardware flags. The negative forms of the [Q]ftz option (`-no-ftz` for Linux* and macOS*, and `/Qftz-` for Windows*) leave the flags as they are.

The following table describes how the compiler processes denormal values based on the status of the FTZ and DAZ flags:

<table>
<thead>
<tr>
<th>Flag</th>
<th>When set to ON, the compiler...</th>
<th>When set to OFF, the compiler...</th>
<th>Supported on</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTZ</td>
<td>...sets denormal results from floating-point calculations to zero.</td>
<td>...does not change the denormal results.</td>
<td>Intel® 64 and some IA-32 architectures</td>
</tr>
<tr>
<td>DAZ</td>
<td>...treats denormal values used as input to floating-point instructions as zero.</td>
<td>...does not change the denormal instruction inputs.</td>
<td>Intel® 64 and some IA-32 architectures</td>
</tr>
</tbody>
</table>

- **FTZ and DAZ** are not supported on all IA-32 architectures. The FTZ flag is supported only on IA-32 architectures that support Intel® SSE instructions.
- On systems based on the IA-32 and Intel® 64 architectures, FTZ only applies to Intel® SSE and Intel® AVX instructions. If the application generates denormals using x87 instructions, FTZ does not apply.
- DAZ and FTZ flags are not compatible with the IEEE 754 standard, and should only be enabled when compliance to the IEEE standard is not required.

Options for [Q]ftz are performance options. Setting these options does not guarantee that all denormals in a program are flushed to zero. They only cause denormals generated at run-time to be flushed to zero.

On Intel® 64 and IA-32 systems, the compiler, by default, inserts code into the main routine to set the FTZ and DAZ flags. When the [Q]ftz option is used on IA-32 systems with the option `-msse2` or `/arch:sse2`, the compiler inserts code to that conditionally sets the FTZ/DAZ flags based on a run-time processor check. Using the negative form of [Q]ftz prevents the compiler from inserting any code that sets FTZ or DAZ flags.

When the [Q]ftz option is used in combination with an Intel® SSE-enabling option on systems based on the IA-32 architecture (for example, `-msse2` or `/arch:sse2`), the compiler inserts code in the main routine to set FTZ and DAZ. When the option [Q]ftz is used without an Intel® SSE-enabling option, the compiler inserts code that conditionally sets FTZ or DAZ based on a run-time processor check. The negative form of [Q]ftz prevents the compiler from inserting any code that might set FTZ or DAZ.

The [Q]ftz option only has an effect when the main program is being compiled. It sets the FTZ/DAZ mode for the process. The initial thread, and any subsequently created threads, operate in the FTZ/DAZ mode.

On systems based on Intel® 64 and IA-32 architectures, every optimization option O level, except O0, sets [Q]ftz.
If this option produces undesirable results of the numerical behavior of the program, turn the FTZ/DAZ mode off by using the negative form of [Q]ftz in the command line while still benefitting from the O3 optimizations.

Manually set the flags with the following macros:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable FTZ</td>
<td>_MM_SET_FLUSH_ZERO_MODE(_MM_FLUSH_ZERO_ON)</td>
</tr>
<tr>
<td>Enable DAZ</td>
<td>_MM_SET_DENORMALS_ZERO_MODE(_MM_DENORMALS_ZERO_ON)</td>
</tr>
</tbody>
</table>

The prototypes for these macros are in `xmmintrin.h (FTZ)` and `pmmintrin.h (DAZ)`.

`ftz, Qftz compiler option`

**Checking the Floating-point Stack State**

On systems based on the IA-32 architecture, when an application calls a function that returns a floating-point value, the returned floating-point value is supposed to be on the top of the floating-point stack. If the return value is not used, the compiler must pop the value off of the floating-point stack in order to keep the floating-point stack in the correct state.

On systems based on Intel® 64 architecture, floating-point values are usually returned in the `xmm0` register. The floating-point stack is used only when the return value is a long double on Linux* and macOS* systems.

If the application calls a function without defining or incorrectly defining the function’s prototype, the compiler cannot determine if the function must return a floating-point value. Consequently, the return value is not popped off the floating-point stack if it is not used. This can cause the floating-point stack to overflow.

The overflow of the stack results in two undesirable situations:

- A NaN value gets involved in the floating-point calculations
- The program results become unpredictable; the point where the program starts making errors can be arbitrarily far away from the point of the actual error.

For systems based on the IA-32 and Intel® 64 architectures, the [Q]fp-stack-check option checks whether a program makes a correct call to a function that should return a floating-point value. If an incorrect call is detected, the option places a code that marks the incorrect call in the program. The [Q]fp-stack-check option marks the incorrect call and makes it easy to find the error.

**NOTE**

The [Q]fp-stack-check option causes significant code generation after every function/subroutine call to ensure that the floating-point stack is maintained in the correct state. Therefore, using this option slows down the program being compiled. Use the option only as a debugging aid to find floating point stack underflow/overflow problems, which can be otherwise hard to find.

`fp-stack-check, Qfp-stack-check compiler option`

**Tuning Performance**

**Overview: Tuning Performance**

This section describes several programming guidelines that can help you improve the performance of floating-point applications:
• Avoid exceeding representable ranges during computation; handling these cases can have a performance impact.
• Use a single-precision type (for example, float) unless the extra precision and/or range obtained through double or long double is required. Greater precision types increase memory size and bandwidth requirements. See Using Efficient Data Types section.
• Reduce the impact of denormal exceptions for all supported architectures.
• Avoid mixed data type arithmetic expressions.

See Also
Avoiding Mixed Data Type Arithmetic Expressions
Reducing the Impact of Denormal Exceptions
Using Efficient Data Types

Handling Floating-point Array Operations in a Loop Body
Following the guidelines below will help auto-vectorization of the loop.

• Statements within the loop body may contain float or double operations (typically on arrays). The following arithmetic operations are supported: addition, subtraction, multiplication, division, negation, square root, MAX, MIN, and mathematical functions such as SIN and COS.
• Writing to a single-precision scalar/array and a double scalar/array within the same loop decreases the chance of auto-vectorization due to the differences in the vector length (that is, the number of elements in the vector register) between float and double types. If auto-vectorization fails, try to avoid using mixed data types.

NOTE
The special __m64, __m128, and __m256 datatypes are not vectorizable. The loop body cannot contain any function calls. Use of the Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) intrinsics (for example, mm_add_ps) is not allowed.

See Also
Programming Guidelines for Vectorization

Reducing the Impact of Denormal Exceptions
Denormalized floating-point values are those that are too small to be represented in the normal manner; that is, the mantissa cannot be left-justified. Denormal values require hardware or operating system interventions to handle the computation, so floating-point computations that result in denormal values may have an adverse impact on performance.

There are several ways to handle denormals to increase the performance of your application:

• Scale the values into the normalized range
• Use a higher precision data type with a larger range
• Flush denormals to zero

For example, you can translate them to normalized numbers by multiplying them using a large scalar number, doing the remaining computations in the normal space, then scaling back down to the denormal range. Consider using this method when the small denormal values benefit the program design.

Consider using a higher precision data type with a larger range; for example, by converting variables declared as float to be declared as double. Understand that making the change can potentially slow down your program. Storage requirements will increase, which will increase the amount of time for loading and storing data from memory. Higher precision data types can also decrease the potential throughput of Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) operations.

If you change the type declaration of a variable, you might also need to change associated library calls, unless these are generic; for example, cos() instead of cosf(). Another strategy that might result in increased performance is to increase the amount of precision of intermediate values using the
-fp-model [double|extended] option. However, this strategy might not eliminate all denormal exceptions, so you must experiment with the performance of your application. You should verify that the gain in performance from eliminating denormals is greater than the overhead of using a data type with higher precision and greater dynamic range.

In many cases, denormal numbers can be treated safely as zero without adverse effects on program results. Depending on the target architecture, use flush-to-zero (FTZ) options.

### IA-32 and Intel® 64 Architectures

These architectures take advantage of the FTZ (flush-to-zero) and DAZ (denormals-are-zero) capabilities of Intel® Streaming SIMD Extensions (Intel® SSE) instructions.

By default, the Intel® C++ Compiler inserts code into the main routine to enable FTZ and DAZ at optimization levels higher than O0. To enable FTZ and DAZ at O0, compile the source file containing main() PROGRAM using compiler option [Q]ftz. When the [Q]ftz option is used on IA-32-based systems with the option –mia32 (Linux*) or /arch:IA32 (Windows*), the compiler inserts code to conditionally enable FTZ and DAZ flags based on a run-time processor check.

**NOTE**

After using flush-to-zero, ensure that your program still gives correct results when treating denormalized values as zero.

**Setting the FTZ and DAZ Flags**

Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture

### Avoiding Mixed Data Type Arithmetic Expressions

Avoid mixing integer and floating-point (float, double, or long double) data in the same computation. Expressing all numbers in a floating-point arithmetic expression (assignment statement) as floating-point values eliminates the need to convert data between fixed and floating-point formats. Expressing all numbers in an integer arithmetic expression as integer values also achieves this. This improves run-time performance.

For example, assuming that I and J are both int variables, expressing a constant number (2.) as an integer value (2) eliminates the need to convert the data. The following examples demonstrate inefficient and efficient code.

### Examples

<table>
<thead>
<tr>
<th>Inefficient Code Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>int I, J;</td>
</tr>
<tr>
<td>I = J / 2.</td>
</tr>
<tr>
<td>;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Efficient Code Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>int I, J;</td>
</tr>
<tr>
<td>I = J / 2;</td>
</tr>
</tbody>
</table>

### Special Considerations for Auto-Vectorization of the Innermost Loops

Auto-vectorization of an innermost loop packs multiple data elements from consecutive loop iterations into a vector register, each of which is 128-bit (SSE) or 256 bit (AVX) in size.
Consider a loop that uses different sized data, for example, REAL and DOUBLE PRECISION. For REAL data, the compiler tries to pack data elements from four (SSE) or eight (AVX) consecutive iterations (32 bits x 4 = 128 bits, 32 bits x 8 = 256 bits). For DOUBLE PRECISION data, the compiler tries to pack data elements from two (SSE) or four (AVX) consecutive iterations (64 bits x 2 = 128 bits, 64 bits x 4 = 256 bits). Because of the mismatched number of iterations, the compiler sometimes fails to perform auto-vectorization of the loop, after trying to automatically remedy the situation.

If your attempt to auto-vectorize an innermost loop fails, it is a good practice to try using the same sized data. INTEGER and REAL are considered same sized data since both are 32-bit in size.

### Examples

#### Example 1: Not auto-vectorizable code

```c
DOUBLE PRECISION A(N), B(N)
REAL C(N), D(N)
DO I=1, N
  A(I)=D(I)
  C(I)=B(I)
ENDDO
```

#### Example 2: Auto-vectorizable after automatic distribution into two loops

```c
DOUBLE PRECISION A(N), B(N)
REAL C(N), D(N)
DO I=1, N
  A(I)=B(I)
  C(I)=D(I)
ENDDO
```

#### Example 3: Auto-vectorizable as one loop

```c
REAL A(N), B(N)
REAL C(N), D(N)
DO I=1, N
  A(I)=B(I)
  C(I)=D(I)
ENDDO
```

### Using Efficient Data Types

In cases where more than one data type can be used for a variable, consider selecting the data types based on the following hierarchy, listed from most to least efficient:

- char
- short
- int
- long
- long long
- float
- double
- long double

*NOTE*

In an arithmetic expression, you should avoid mixing integer and floating-point data.
You can use integer data types \((\text{int}, \text{int long}, \text{etc.})\) in loops to improve floating point performance. Convert the data type to integer data types, process the data, then convert the data to the old type.

**Understanding IEEE Floating-Point Operations**

**Understanding the IEEE Standard for Floating-Point Arithmetic, IEEE 754-2008**

This version of the compiler uses a close approximation to the IEEE Standard for Floating-Point Arithmetic, version IEEE 754-2008, unless otherwise stated. This standard is common to many microcomputer-based systems due to the availability of fast processors that implement the required characteristics.

This section outlines the characteristics of the IEEE 754-2008 standard and its implementation in the compiler. Except as noted, the description refers to both the IEEE 754-2008 standard and the compiler implementation.

**Floating-Point Formats**

This IEEE 754-2008 standard specifies formats and methods for floating-point representation in computer systems, and recommends formats for data interchange. The exception conditions are defined, and the standard handling of these conditions is specified below. The binary counterpart floating-point exception functions are described in ISO C99. The decimal floating-point exception functions are defined in the \(\text{fenv.h}\) header file. The compiler supports decimal floating point types in C and C++. The decimal floating point formats are defined in the IEEE 754-2008 standard.

In C, these decimal floating types are supported:

- \(_{\text{Decimal32}}\)
- \(_{\text{Decimal64}}\)
- \(_{\text{Decimal128}}\)

In C++ for Windows* and Linux*, these decimal classes are supported:

- \(\text{decimal32}\)
- \(\text{decimal64}\)
- \(\text{decimal128}\)

**NOTE** To use this feature in C++ on Linux*, GCC* 4.5 or later is required.

The decimal floating-point is not supported in C++ for macOS*.

To ensure correct decimal floating-point behavior, you must define \(\_\text{STDC}_WANT_DEC_FP\) before any standard headers are included. This is required for the declaration of decimal macros and library functions in order to ensure correct decimal floating-point results at run-time.

**Example: Linux**

```cpp
#include <iostream>
define _STDC_WANT_DEC_FP_
#include <decimal/decimal>
typedef std::decimal::decimal32 _Decimal32;
typedef std::decimal::decimal64 _Decimal64;
typedef std::decimal::decimal128 _Decimal128;
#include <dfp754.h>

using namespace std;
using namespace std::decimal;

int main() {
    std::decimal::decimal32 d = 4.7df;
}
```
```cpp
std::cout << decimal_to_long_double(d) << std::endl;
return 0;
}
```

**Example: Windows**

```cpp
#include <iostream>
#define __STDC_WANT_DEC_FP__
#include <decimal>
#include <dfp754.h>

using namespace std;
using namespace std::decimal;

int main() {
    std::decimal::decimal32 d = 4.7df;
    std::cout << decimal_to_long_double(d) << std::endl;
    return 0;
}
```

### Functions to Check Decimal Floating-Point Status

Use these floating-point exception functions to detect exceptions that occur during decimal floating-point arithmetic:

**Floating-Point Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Brief Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fe_dec_feclearexcept()</td>
<td>Clears the supported floating-point exceptions.</td>
</tr>
<tr>
<td>fe_dec_fegetexceptflag</td>
<td>Stores an implementation-defined representation of the states of the floating-point status flags.</td>
</tr>
<tr>
<td>fe_dec_feraiseexcept</td>
<td>Raises the supported floating-point exceptions.</td>
</tr>
<tr>
<td>fe_dec_fesetexceptflag</td>
<td>Sets the floating-point status flags.</td>
</tr>
<tr>
<td>fe_dec_fetestexcept()</td>
<td>Determines which of a specified subset of the floating point exception flags are currently set.</td>
</tr>
</tbody>
</table>

### Special Values

This is a list and a brief description of the special values that the Intel® C++ Compiler supports.

**Signed Zero**

The sign of zero is the same as the sign of a nonzero number. Comparisons consider +0 to be equal to -0. A signed zero is useful in certain numerical analysis algorithms, but in most applications the sign of zero is invisible.

**Denormalized Numbers**

Denormalized numbers (denormals) fill the gap between the smallest positive and the smallest negative normalized number, otherwise only (+/-) 0 occurs in the interval. Denormalized numbers extend the range of computable results by allowing for gradual underflow.

Systems based on the IA-32 architecture support a Denormal Operand status flag. When this is set, at least one of the input operands to a floating-point operation is a denormal. The Underflow status flag is set when a number loses precision and becomes a denormal.
Signed Infinity

Infinities are the result of arithmetic in the limiting case of operands with arbitrarily large magnitude. They provide a way to continue when an overflow occurs. The sign of an infinity is simply the sign you obtain for a finite number in the same operation as the finite number approaches an infinite value.

By retrieving the status flags, you can differentiate between an infinity that results from an overflow and one that results from division by zero. The Intel® C++ Compiler treats infinity as signed by default. The output value of infinity is +Infinity or -Infinity.

Not a Number

Not a Number (NaN) results from an invalid operation. For example, 0/0 and SQRT(-1) result in NaN. In general, an operation involving a NaN produces another NaN. Because the fraction of a NaN is unspecified, there are many possible NaNs.

The Intel® C++ Compiler treats all NaNs identically, but provides two different types:

- Signaling NaN, which has an initial mantissa bit of 0 (zero). This usually raises an invalid exception when used in an operation.
- Quiet NaN, which has an initial mantissa bit of 1.

The floating-point hardware changes a signaling NaN into a quiet NaN during many arithmetic operations, including the assignment operation. An invalid exception may be raised but the resulting floating-point value is a quiet NaN.

The output value of NaN is NaN.

Attributes

Attributes are a way to provide additional information about a declaration to the compiler.

Using Attributes

The Intel® compiler supports three ways to add attributes to your program:

- Gnu Syntax
  ```c
  __attribute__((attribute_name(arguments)))
  ```
- Microsoft Syntax
  ```c
  __declspec(attribute_name(argument))
  ```
- C++11 Standardized Attribute Syntax (part of the C++11 language standard)
  ```c
  [[attribute_name(arguments)]]
  ```
  ```c
  [[attribute-namespace :: attribute_name(arguments)]]
  ```

Some attributes are available for both Intel® and non-Intel microprocessors but they may perform additional optimizations for Intel® microprocessors than they perform for non-Intel microprocessors. Refer to the individual attribute name for a detailed description.

align

Directs the compiler to align the variable to a specified boundary and a specified offset.
**Syntax**

**Windows OS:**  
__declspec(align(n[, off]))

**Linux OS:**  
__attribute__((aligned(n[, off])))

For portability on Linux OS, you should use the syntax form __attribute__((aligned(n[, off]))) This form is compatible with the GNU compiler.

**Arguments**

- **n**: Specifies the alignment. The compiler will align the variable to an n-byte boundary.
- **off**: Optional. Specifies the offset. If this argument is omitted, the value is 0.

**Description**

This keyword directs the compiler to align the variable to an n-byte boundary with offset off within each n-byte boundary. The address of the variable is address mod n=off.

---

**NOTE**

If you require 8-byte alignment, we recommend you specify 16 for n, instead of 8. When 8 is used, the compiler interprets the value as a suggestion and you may not get the requested 8-byte alignment, depending on various heuristics.

**align_value**

*Provides the ability to add a pointer alignment value to a pointer typedef declaration.*

**Syntax**

**Windows OS:**  
__declspec(align_value(alignment))

**Linux OS:**  
__attribute__((align_value(alignment)))

**Arguments**

- **alignment**: Specifies the alignment (8, 16, 32, 64, 128, 256,...) for what the pointer points to.

**Description**

This keyword can be added to a pointer typedef declaration to specify the alignment value of pointers declared for that pointer type.

This indicates to the compiler that the data referenced by the designated pointer is aligned by the indicated value, and the compiler can generate code based on that assumption. If this attribute is used incorrectly, and the data is not aligned to the designated value, the behavior is undefined.
avoid_false_share

Provides the ability to pad and/or align the defined variable such that it will not be subject to false cache line sharing with any other variable.

Syntax

Windows* OS:
__declspec(avoid_false_share(identifier))variable definition

Linux* OS:
__attribute__((avoid_false_share(identifier)))variable definition

Arguments

identifier
Specifies the string that will be used to identify one or more variables. Variables with the same identifier do not need protection from false sharing.

variable definition
Specifies the variable to be padded or aligned.

Description

This keyword indicates to the compiler that it should allocate the variable through padding and/or alignment such that it will not share the cache line with other variables unless they share the same identifier. This keyword must occur on a variable definition in function, global, or namespace scope. It is not permitted on a non-static class member or on a function argument.

If you specify an identifier, the variable definition does not need to be protected from false sharing with other variables that are similarly declared with the same identifier. If the variable definition is in function scope, the scope of the identifier is the current function. If the variable definition is in namespace or global scope, the scope of the identifier is the current compilation unit.

This keyword is supported for scalars and arrays and is not supported for structure fields, function arguments, functions, and references.

code_align

Specifies the byte alignment for a routine.

Syntax

Windows* OS:
__declspec(code_align(n))

Linux* OS, macOS*:
__attribute__((code_align(n)))

Arguments

n
Optional. A positive integer indicating the number of bytes for the minimum desired alignment boundary. Its value must be a power of 2, between 1 and 4096, such as 1, 2, 4, 8, and so on.

If you specify 1 for n, no alignment is performed. If you do not specify n, the default alignment is 16 bytes.
Description
This keyword must be placed on the routine to be aligned.
If anything inside the routine requires specific alignment \( k \), the final routine alignment will be \( \max(n,k) \).

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

cpu_dispatch attribute
Processor Targeting

**concurrency_safe**

Guides the compiler to parallelize more loops and straight-line code.

Syntax

Windows* OS:

```c
__declspec(concurrency_safe(clause))
```

Linux* OS:

```c
__attribute__((concurrency_safe(clause)))
```

Arguments

`clause`

Is one of the following:

- `cost(cycles)`: Specifies the execution cycles of the annotated function for the compiler to perform parallelization profitability analysis while compiling its enclosing loops or blocks. The value of `cycles` is a 2-byte unsigned integer (unsigned short); its maximal value is \( 2^{16}-1 \). If the cycle count is greater than \( 2^{16}-1 \), you should use `profitable`.

- `profitable`: Specifies that the loops or blocks that contain calls to the annotated function are profitable to parallelize.

Description

This keyword indicates to the compiler that there are no incorrect side-effects and no illegal (or improperly synchronized) memory access interferences among multiple invocations of the annotated function or between an invocation of this annotated function and other statements in the program, if they are executed concurrently.
For every function that is marked with this keyword, you must ensure that its side effects (if any) are acceptable (or expected), and the memory access interferences are properly synchronized.

**const**

*Indicates that a function has no effect other than returning a value and that it uses only its arguments to generate that return value.*

**Syntax**

*Windows* OS:

\_declspec(const)

*Linux* OS:

\_attribute\_((const))

**Arguments**

None

**Description**

This keyword is equivalent to the gcc attribute `const` and applies to function declarations.

**cpu_dispatch**

*Provides the ability to write one or more versions of a function that execute only on a list of targeted processors.*

**Syntax**

*Windows* OS:

\_declspec(cpu_dispatch(cpuid, cpuid, ...))

*Linux* OS:

\_attribute\_((cpu_dispatch(cpuid, cpuid, ...)))

**Arguments**

`cpuid`

See `cpu_specific` for a list of supported values.

**Description**

Use this keyword to provide a list of targeted processors, along with an empty function body/function stub. This feature is available only for Intel processors based on IA-32 or Intel® 64 architecture. It is not available for non-Intel processors. Applications built using the manual processor dispatch feature may be more highly optimized for Intel processors than for non-Intel processors.

**See Also**

cpu_specific attribute

Processor Targeting
**cpu_specific**

Provides the ability to declare that a version of a function is targeted at particular type(s) of processors.

**Syntax**

**Windows* OS:**

```
__declspec(cpu_specific(cpuid))
```

**Linux* OS:**

```
__attribute__((cpu_specific((cpuid)))
```

**Arguments**

- `cpuid`

  Possible values are:

  - `atom`: Intel® Atom™ processors with Intel® Supplemental Streaming SIMD Extensions 3 (Intel® SSSE3)
  - `atom_sse4_2`: Intel® Atom™ processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2)
  - `atom_sse4_2_movbe`: Intel® Atom™ processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) with MOVBE instructions enabled
  - `broadwell`: This is a synonym for `core_5th_gen_avx`
  - `core_2_duo_sse4_1`: Intel® 45nm Hi-k next generation Intel® Core™ microarchitecture processors with Intel® Streaming SIMD Extensions 4.1 (Intel® SSE4.1) instructions
  - `core_2_duo_sse3`: Intel® Core™2 Duo processors and Intel® Xeon® processors with Intel® Supplemental Streaming SIMD Extensions 3 (Intel® SSSE3) instructions
  - `core_2nd_gen_avx`: 2nd generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions (Intel® AVX)
  - `core_3rd_gen_avx`: 3rd generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions (Intel® AVX) including the RDRND instruction
  - `core_4th_gen_avx`: 4th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDRND instruction
  - `core_4th_gen_avx_tsx`: 4th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDRND instruction, and support for Intel® Transactional Synchronization Extensions (Intel® TSX)
  - `core_5th_gen_avx`: 5th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDSEED and Multi-Precision Add-Carry Instruction Extensions (ADX) instructions
core_5th_gen_avx_tsx: 5th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDSEED and Multi-Precision Add-Carry Instruction Extensions (ADX) instructions, and support for Intel® Transactional Synchronization Extensions (Intel® TSX)

core_aes_pclmulqdq: Intel® Core™ processors with support for Advanced Encryption Standard (AES) instructions and carry-less multiplication instruction

core_i7_sse4_2: Intel® Core™ i7 processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) instructions

generic: Other Intel processors for IA-32 or Intel® 64 architecture or compatible processors not provided by Intel Corporation

haswell: This is a synonym for core_4th_gen_avx

knl: This is a synonym for mic_avx512

knm: The Intel® Xeon Phi™ product family code name Knights Mill

mic: Intel® Many Integrated Core Architecture (Intel® MIC Architecture)

mic_avx512: 2nd generation Intel® Xeon Phi™ processor family with support for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection instructions, Intel® AVX-512 Exponential and Reciprocal instructions, Intel® AVX-512 Prefetch instructions for Intel® processors, and Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDSEED and Multi-Precision Add-Carry Instruction Extensions (ADX) instructions. This setting is only available on Intel® 64 architecture targeting the Intel® Xeon Phi™ product family x200 (formerly code name Knights Landing).

pentium: Intel® Pentium® processor

pentium_4: Intel® Pentium® 4 processors

pentium_4_sse3: Intel® Pentium® 4 processor with Intel® Streaming SIMD Extensions 3 (Intel® SSE3) instructions, Intel® Core™ Duo processors, Intel® Core™ Solo processors

pentium_i: Intel® Pentium® II processors

pentium_iii: Intel® Pentium® III processors

pentium_iii_no_xmm_regs: Intel® Pentium® III processors with no XMM registers

pentium_m: Intel® Pentium® M processors

pentium_mmx: Intel® Pentium® processors with MMX™ technology

pentium_pro: Intel® Pentium® Pro processors

skylake: Intel® microarchitecture code name Skylake. This keyword targets the Client CPU without support for Intel® AVX-512 instructions

skylake-avx512: Intel® microarchitecture code name Skylake. This keyword targets the Server CPU with support for Intel® AVX-512 instructions
Description

Use this keyword to declare each function version targeted at particular type(s) of processors.

This feature is available only for Intel processors based on IA-32 or Intel® 64 architecture. It is not available for non-Intel processors. Applications built using the manual processor dispatch feature may be more highly optimized for Intel processors than for non-Intel processors.

Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel. Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Notice revision #20110804

cpu_dispatch attribute
Processor Targeting

mpx

Directs the compiler to pass Intel® Memory Protection Extensions (Intel® MPX) bounds information along with any pointer-typed parameters.

Syntax

Windows OS:

__declspec(mp)  

Arguments

None

Description

When a function declared with this keyword is called, any pointer-typed parameters passed to the function will also have Intel® MPX bounds information passed. If the called function returns a pointer-typed object, the compiler will expect the function to return Intel® MPX bounds information along with the pointer object. Similarly, if this keyword is applied to a function definition, the function will expect the caller to pass Intel® MPX bounds information along with any pointer-type parameters. If the function returns a pointer-typed object, Intel® MPX bounds information will be returned with the object.

NOTE

The usage of this attribute is intended for Windows code that contains hand-written Intel® MPX enhancements based on Intel® MPX inline assembly or calls to Intel® MPX intrinsics, and where the user does not wish to enable automatic Intel® MPX code generation.
target

Specifies a target for called functions or variables. This attribute only applies to Intel® MIC Architecture.

Syntax

Windows* OS:

_declspec(target(target-name))

Linux* OS:

__attribute__((target(target-name)))

Arguments

target-name

Specifies the target name. Possible values are:

mic: Specifies the target name is Intel® Many Integrated Core Architecture (Intel® MIC Architecture). This value is available on Windows* OS and Linux* OS on Intel® 64 architecture.

Description

This keyword specifies that the called function or variable is also available on the target. Only functions or variables marked with this attribute are available on the target, and only these functions can be called on the target.

vector

Provides the ability to vectorize user-defined functions and loops.

Syntax

Windows* OS:

_declspec(vector(clauses))

Linux* OS:

__attribute__((vector(clauses)))

Arguments

clauses

Is one of the following:

processor clause, in the form processor(cpuid). This clause creates a vector version of the function for the given target processor (cpuid). See cpu_specific for a list of supported values. The default processor is determined by the implicit or explicit process- or architecture-specific flag in the compiler command line.

vector length clause, in the form vectorlength(n), where n is a vectorlength (vl) and must be an integer with the value 2, 4, 8, or 16. This clause tells the compiler that each routine invocation at the call site should execute the computation equivalent to n times the scalar function execution.
linear clause, in the form linear(param1:step1 [, param2:step2]...),
where param is a scalar variable and step is a compile-time integer constant expression. This clause tells the compiler that for each consecutive invocation of the routine in a serial execution, the value of param1 is incremented by step1, param2 is incremented by step2, and so on. If more than one step is specified for a particular variable, a compile-time error occurs. Multiple linear clauses are merged as a union.

uniform clause, in the form uniform(param [, param,]...), where param is a formal parameter of the specified function. This clause tells the compiler that the values of the specified arguments can be broadcast to all iterations as a performance optimization.

mask clause, in the form [no]mask. This clause tells the compiler to generate a masked vector version of the routine.

Description
This keyword combines with the map operation at the call site to provide the data parallel semantics. When multiple instances of the vector declaration are invoked in a parallel context, the execution order among them is not sequenced.

vector_variant
Specifies a vector variant function that corresponds to its original C/C++ scalar function. This vector variant function can be invoked under vector context at call sites.

Syntax
Windows* OS:
__declspec(vector_variant(clauses))

Linux* OS:
__attribute__((vector_variant(clauses)))

Arguments
clausess
Is the following:

implements clause, in the form implements (<function declarator>) [, <simd-clauses>]), where function declarator is the original scalar function, and simd-clauses is one or more of the clauses allowed for the vector attribute. The simd-clauses are optional.

Description
This attribute provides a means for programmers to describe the association between the vector variant function and its corresponding scalar function. The compiler will use the vector variant to replace the scalar call for a vectorized loop.

The following are restrictions for this attribute:

- A vector variant function can have only one vector_variant annotation.
- A vector variant annotation can have only one implements clause.
- A vector variant annotation applies to only one vector variant function, which must not have both mask and nomask clauses specified. It can be specified with either mask or nomask; the default is nomask.
A vector variant function should have the \_regcall attribute.

If the user-defined vector variant function is a variant with mask, the mask argument should be the last argument.

**Example**

The following shows an example of a vector variant function:

```c
#include <immintrin.h>

__declspec(noinline)
float MyAdd(float* a, int b) { return *a + b; }

__declspec(vector_variant(implements(MyAdd(float *a, int b)),
linear(a), vectorlength(8),
nomask, processor(core_2nd_gen_avx)))
__m256 __regcall MyAddVec(float* v_a, __m128i v_b, __m128i v_b2) {
    __m256i t96 = _mm256_castsi128_si256(v_b);
    __m256i tmp = _mm256_insertf128_si256(t96, v_b2, 1);
    __m256i t95 = _mm256_cvtepi32_ps(tmp);
    return _mm256_add_ps(*((__m256*)v_a), t95);
}

float x[2000], y[2000];
float foo(float y[]) {
    #pragma omp simd
    for (int k=0; k< 2000; k++) {
        x[k] = MyAdd(&y[k], k);
    }
    return x[0] + x[1999];
}
```

If the return value contains more than one register, the following technique can be used for the correct definition of the function:

```c
#include <immintrin.h>

typedef struct {
    __m256d r1;
    __m256d r2;
} __m256dx2;

__declspec(noinline)
double MyAdd(double* a, int b) { return *a + b; }

__declspec(vector_variant(implements(MyAdd(double *a, int b)),
linear(a), vectorlength(8),
nomask, processor(core_2nd_gen_avx)))
__m256dx2 __regcall MyAddVec(double* v_a, __m128i v_b, __m128i v_b2) {
    __m256d t1 = _mm256_cvtepi32_pd(v_b);
    __m256d t2 = _mm256_cvtepi32_pd(v_b2);
    __m256dx2 ret;
    ret.r1 = _mm256_mul_pd(t1,*((__m256d*)v_a));
    ret.r2 = _mm256_mul_pd(t2,*((__m256d*)v_a)+1));
    return ret;
}

__declspec(align(32)) double x[2000], y[2000];
double foo(double* y) {
    #pragma omp simd
    for (int k=0; k< 2000; k++) {
        x[k] = MyAdd(y, k);
        y++;
    }
}
```
Intrinsics

Intrinsics are assembly-coded functions that allow you to use C++ function calls and variables in place of assembly instructions.

Intrinsics are expanded inline eliminating function call overhead. Providing the same benefit as using inline assembly, intrinsics improve code readability, assist instruction scheduling, and help reduce debugging.

Intrinsics provide access to instructions that cannot be generated using the standard constructs of the C and C++ languages.

**NOTE**
When developing and debugging your program, compile your sources with `-D__INTEL_COMPILER_USE_INTRINSIC_PROTOTYPES` to take advantage of improved compile-time checking of the intrinsics functions. When done be sure to remove this option as it significantly increases compile time.

Intrinsics for Intel® C++ Compilers

The Intel® C++ Compiler enables easy implementation of assembly instructions through the use of intrinsics. Intrinsics are provided for the following instructions:

- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) instructions
- Intel® Advanced Vector Extensions 2 (Intel® AVX2) instructions
- Intel® Advanced Vector Extensions (Intel® AVX) instructions
- Intel® Streaming SIMD Extensions 4 (Intel® SSE4) instructions
- Intel® Supplemental Streaming SIMD Extensions 3 (SSSE3) instructions
- Intel® Streaming SIMD Extensions 3 (Intel® SSE3) instructions
- MMX™ Technology instructions
- Carry-less Multiplication instruction and Advanced Encryption Standard Extensions instructions
- Half-float conversion instructions

The Short Vector Math Library (svml) intrinsics are documented in this reference.

**NOTE**
Many routines in the svml library are more optimized for Intel® microprocessors than for non-Intel microprocessors.

Availability of Intrinsics on Intel Processors

Not all Intel® processors support all intrinsics. For information on which intrinsics are supported on Intel® processors, visit http://processorfinder.intel.com. The Processor Spec Finder tool links directly to all processor documentation and the data sheets list the features, including intrinsics, supported by each processor.

The Intel® Intrinsics Guide

Details about Intrinsics

All instructions use the following features:

- Registers
- Data Types

Registers

Intel® processors provide special register sets for different instructions.

- Intel® MMX™ instructions use eight 64-bit registers (mm0 to mm7) which are aliased on the floating-point stack registers.
- Intel® Streaming SIMD Extensions (Intel® SSE) and the Advanced Encryption Standard (AES) instructions use eight 128-bit registers (xmm0 to xmm7).
- Intel® Advanced Vector Extensions (Intel® AVX) instructions use 256-bit registers which are extensions of the 128-bit SIMD registers.

Because each of these registers can hold more than one data element, the processor can process more than one data element simultaneously. This processing capability is also known as single-instruction multiple data processing (SIMD).

For each computational and data manipulation instruction in the new extension sets, there is a corresponding C intrinsic that implements that instruction directly. This frees you from managing registers and assembly programming. Further, the compiler optimizes the instruction scheduling so that your executable runs faster.

Data Types

Intrinsic functions use new C data types as operands, representing the new registers that are used as the operands to these intrinsic functions.

The following table details for which instructions each of the new data types are available. A 'Yes' indicates that the data type is available for that group of intrinsics; an 'NA' indicates that the data type is not available for that group of intrinsics.

__m64 Data Type

The __m64 data type is used to represent the contents of an MMX register, which is the register that is used by the MMX™ technology intrinsics. The __m64 data type can hold eight 8-bit values, four 16-bit values, two 32-bit values, or one 64-bit value.

__m128 Data Types

The __m128 data type is used to represent the contents of a SSE register used by the Intel® Streaming SIMD Extensions (Intel® SSE) intrinsics.

Conventionally, the __m128 data type can hold four 32-bit floating-point values, while the __m128d data type can hold two 64-bit floating-point values, and the __m128i data type can hold sixteen 8-bit, eight 16-bit, four 32-bit, or two 64-bit integer values.

The compiler aligns __m128d and __m128i local and global data to 16-byte boundaries on the stack. To align integer, float, or double arrays, use the __declspec(align) statement.

Accessing __m128i Data

To access 8-bit data on IA-32 and Intel® 64 architecture-based systems, use the mm_extract intrinsics as follows:

```c
#define _mm_extract_epi8(x, imm) \  (((imm) & 0x1) == 0) ? \  _mm_extract_epi16((x), (imm) >> 1) & 0xff : \  _mm_extract_epi16(_mm_srli_epi16((x), 8), (imm) >> 1))
```

To access 16-bit data, use:

```c
int _mm_extract_epi16(__m128i a, int imm)
```

To access 32-bit data, use:

```c
#define _mm_extract_epi32(x, imm) \  _mm_cvtsi128_si32(_mm_srli_si128((x), 4 * (imm)))
```

To access 64-bit data (Intel® 64 architecture only), use:

```c
#define _mm_extract_epi64(x, imm) \  _mm_cvtsi128_si64(_mm_srli_si128((x), 8 * (imm)))
```
**__m256 Data Types**

The __m256 data type is used to represent the contents of the extended SSE register - the YMM register, used by the Intel® AVX intrinsics.

The __m256 data type can hold eight 32-bit floating-point values, while the __m256d data type can hold four 64-bit double precision floating-point values, and the __m256i data type can hold thirty-two 8-bit, sixteen 16-bit, eight 32-bit, or four 64-bit integer values. See Details for Intel® AVX Intrinsics for more information.

**Data Types Usage Guidelines**

These data types are not basic ANSI C data types. You must observe the following usage restrictions:

- Use data types as objects in aggregates, such as unions, to access the byte elements and structures.

**See Also**

__declspec(align) declaration

---

**Naming and Usage Syntax**

Most intrinsic names use the following notational convention:

__mm_<intrin_op>_<suffix>

The following table explains each item in the syntax.

<table>
<thead>
<tr>
<th>&lt;intrin_op&gt;</th>
<th>Indicates the basic operation of the intrinsic; for example, add for addition and sub for subtraction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;suffix&gt;</td>
<td>Denotes the type of data the instruction operates on. The first one or two letters of each suffix denote whether the data is packed (p), extended packed (ep), or scalar (s). The remaining letters and numbers denote the type, with notation as follows:</td>
</tr>
<tr>
<td></td>
<td>• s single-precision floating point</td>
</tr>
<tr>
<td></td>
<td>• d double-precision floating point</td>
</tr>
<tr>
<td></td>
<td>• i128 signed 128-bit integer</td>
</tr>
<tr>
<td></td>
<td>• i64 signed 64-bit integer</td>
</tr>
<tr>
<td></td>
<td>• i64 unsigned 64-bit integer</td>
</tr>
<tr>
<td></td>
<td>• i32 signed 32-bit integer</td>
</tr>
<tr>
<td></td>
<td>• u32 unsigned 32-bit integer</td>
</tr>
<tr>
<td></td>
<td>• i16 signed 16-bit integer</td>
</tr>
<tr>
<td></td>
<td>• u16 unsigned 16-bit integer</td>
</tr>
<tr>
<td></td>
<td>• i8 signed 8-bit integer</td>
</tr>
<tr>
<td></td>
<td>• u8 unsigned 8-bit integer</td>
</tr>
</tbody>
</table>

A number appended to a variable name indicates the element of a packed object. For example, r0 is the lowest word of r. Some intrinsics are "composites" because they require more than one instruction to implement them.

The packed values are represented in right-to-left order, with the lowest value being used for scalar operations. Consider the following example operation:

```c
double a[2] = {1.0, 2.0};
__ml28d t = _mm_load_pd(a);
```
The result is the same as either of the following:

```c
__m128d t = _mm_set_pd(2.0, 1.0);
__m128d t = _mm_setr_pd(1.0, 2.0);
```

In other words, the xmm register that holds the value `t` appears as follows:

```
127 2.0 1.0 0
```

The "scalar" element is 1.0. Due to the nature of the instruction, some intrinsics require their arguments to be immediates (constant integer literals).

**Intrinsics for All Intel® Architectures**

**Overview: Intrinsics across Intel® Architectures**

Most of the intrinsics documented in this section function for all supported Intel® architectures.

Some of the intrinsics documented in this section function across Intel® architectures.

The intrinsics are categorized as follows:

- **Integer Arithmetic Intrinsics**
- **Floating-Point Intrinsics**
- **String and Block Copy Intrinsics** (only for IA-32 architecture and Intel® 64 architecture)
- **Miscellaneous Intrinsics**

**Integer Arithmetic Intrinsics**

The following table lists and describes integer arithmetic intrinsics that you can use across Intel® architectures.
## Intrinsic Syntax

<table>
<thead>
<tr>
<th>Intrinsic Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Intrinsics for all Supported Intel® Architectures</strong></td>
<td></td>
</tr>
<tr>
<td>int abs(int)</td>
<td>Returns the absolute value of an integer.</td>
</tr>
<tr>
<td>long labs(long)</td>
<td>Returns the absolute value of a long integer.</td>
</tr>
<tr>
<td>unsigned long _lrotl(unsigned long value, int shift)</td>
<td>Implements 64-bit left rotate of value by shift positions.</td>
</tr>
<tr>
<td>unsigned long _lrotr(unsigned long value, int shift)</td>
<td>Implements 64-bit right rotate of value by shift positions.</td>
</tr>
<tr>
<td>unsigned int _rotl(unsigned int value, int shift)</td>
<td>Implements 32-bit left rotate of value by shift positions.</td>
</tr>
<tr>
<td>unsigned int _rotr(unsigned int value, int shift)</td>
<td>Implements 32-bit right rotate of value by shift positions.</td>
</tr>
<tr>
<td><strong>Intrinsics for IA-32 and Intel® 64 Architectures</strong></td>
<td></td>
</tr>
<tr>
<td>unsigned short _rotwl(unsigned short value, int shift)</td>
<td>Implements 16-bit left rotate of value by shift positions.</td>
</tr>
<tr>
<td>unsigned short _rotwr(unsigned short value, int shift)</td>
<td>Implements 16-bit right rotate of value by shift positions.</td>
</tr>
</tbody>
</table>

**NOTE**

Passing a constant shift value in the rotate intrinsics results in higher performance.

## Floating-point Intrinsics

The following table lists and describes floating point intrinsics that you can use across all Intel® and compatible architectures. Floating-point intrinsic functions may invoke library functions that are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>double fabs(double)</td>
<td>Returns the absolute value of a floating-point value.</td>
</tr>
<tr>
<td>double log(double)</td>
<td>Returns the natural logarithm ln(x), x&gt;0, with double precision.</td>
</tr>
<tr>
<td>float logf(float)</td>
<td>Returns the natural logarithm ln(x), x&gt;0, with single precision.</td>
</tr>
<tr>
<td>double log10(double)</td>
<td>Returns the base 10 logarithm log10(x), x&gt;0, with double precision.</td>
</tr>
<tr>
<td>float log10f(float)</td>
<td>Returns the base 10 logarithm log10(x), x&gt;0, with single precision.</td>
</tr>
<tr>
<td>double exp(double)</td>
<td>Returns the exponential function with double precision.</td>
</tr>
<tr>
<td>float expf(float)</td>
<td>Returns the exponential function with single precision.</td>
</tr>
<tr>
<td>double pow(double, double)</td>
<td>Returns the value of x to the power y with double precision.</td>
</tr>
<tr>
<td>Intrinsic</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>float powf(float, float)</td>
<td>Returns the value of x to the power y with single precision.</td>
</tr>
<tr>
<td>double sin(double)</td>
<td>Returns the sine of x with double precision.</td>
</tr>
<tr>
<td>float sinf(float)</td>
<td>Returns the sine of x with single precision.</td>
</tr>
<tr>
<td>double cos(double)</td>
<td>Returns the cosine of x with double precision.</td>
</tr>
<tr>
<td>float cosf(float)</td>
<td>Returns the cosine of x with single precision.</td>
</tr>
<tr>
<td>double tan(double)</td>
<td>Returns the tangent of x with double precision.</td>
</tr>
<tr>
<td>float tanf(float)</td>
<td>Returns the tangent of x with single precision.</td>
</tr>
<tr>
<td>double acos(double)</td>
<td>Returns the inverse cosine of x with double precision.</td>
</tr>
<tr>
<td>float acosf(float)</td>
<td>Returns the inverse cosine of x with single precision.</td>
</tr>
<tr>
<td>double acosh(double)</td>
<td>Compute the inverse hyperbolic cosine of the argument with double precision.</td>
</tr>
<tr>
<td>float acoshf(float)</td>
<td>Compute the inverse hyperbolic cosine of the argument with single precision.</td>
</tr>
<tr>
<td>double asin(double)</td>
<td>Compute inverse sine of the argument with double precision.</td>
</tr>
<tr>
<td>float asinf(float)</td>
<td>Compute inverse sine of the argument with single precision.</td>
</tr>
<tr>
<td>double asinh(double)</td>
<td>Compute inverse hyperbolic sine of the argument with double precision.</td>
</tr>
<tr>
<td>float asinhf(float)</td>
<td>Compute inverse hyperbolic sine of the argument with single precision.</td>
</tr>
<tr>
<td>double atan(double)</td>
<td>Compute inverse tangent of the argument with double precision.</td>
</tr>
<tr>
<td>float atanf(float)</td>
<td>Compute inverse tangent of the argument with single precision.</td>
</tr>
<tr>
<td>double atanh(double)</td>
<td>Compute inverse hyperbolic tangent of the argument with double precision.</td>
</tr>
<tr>
<td>float atanhf(float)</td>
<td>Compute inverse hyperbolic tangent of the argument with single precision.</td>
</tr>
<tr>
<td>double cabs(double complex z)</td>
<td>Computes absolute value of complex number. The intrinsic argument is a complex number made up of two double precision elements, one real and one imaginary. The input parameter z is made up of two values of double type passed together as a single argument.</td>
</tr>
<tr>
<td>float cabsf(float complex z)</td>
<td>Computes absolute value of complex number. The intrinsic argument is a complex number made up of two single precision elements, one real and one imaginary. The input parameter z is made up of two values of float type passed together as a single argument.</td>
</tr>
<tr>
<td>double ceil(double)</td>
<td>Computes smallest integral value of double precision argument not less than the argument.</td>
</tr>
</tbody>
</table>
### Intrinsic Description

- **float ceilf(float)**: Computes smallest integral value of single precision argument not less than the argument.
- **double cosh(double)**: Computes the hyperbolic cosine of double precision argument.
- **float coshf(float)**: Computes the hyperbolic cosine of single precision argument.
- **float fabsf(float)**: Computes absolute value of single precision argument.
- **double floor(double)**: Computes the largest integral value of the double precision argument not greater than the argument.
- **float floorf(float)**: Computes the largest integral value of the single precision argument not greater than the argument.
- **double fmod(double)**: Computes the floating-point remainder of the division of the first argument by the second argument with double precision.
- **float fmodf(float)**: Computes the floating-point remainder of the division of the first argument by the second argument with single precision.
- **double hypot(double, double)**: Computes the length of the hypotenuse of a right angled triangle with double precision.
- **float hypotf(float, float)**: Computes the length of the hypotenuse of a right angled triangle with single precision.
- **double rint(double)**: Computes the integral value represented as double using the IEEE rounding mode.
- **float rintf(float)**: Computes the integral value represented with single precision using the IEEE rounding mode.
- **double sinh(double)**: Computes the hyperbolic sine of the double precision argument.
- **float sinhf(float)**: Computes the hyperbolic sine of the single precision argument.
- **float sqrtf(float)**: Computes the square root of the single precision argument.
- **double tanh(double)**: Computes the hyperbolic tangent of the double precision argument.
- **float tanhf(float)**: Computes the hyperbolic tangent of the single precision argument.

### String and Block Copy Intrinsics

The following table lists and describes string and block copy intrinsics that you can use on systems based on IA-32 and Intel® 64 architectures. They may invoke library functions that are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

#### NOTE

`strncpy()` and `strcmp()` functions are implemented as intrinsics depending on compiler version and compiler switches like optimization level.
<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>char * __strset(char *, _int32)</td>
<td>Sets all characters in a string to a fixed value.</td>
</tr>
<tr>
<td>int memcmp(const void *cs, const void *ct, size_t n)</td>
<td>Compares two regions of memory. Return:</td>
</tr>
<tr>
<td></td>
<td>• &lt;0 if cs&lt;ct</td>
</tr>
<tr>
<td></td>
<td>• 0 if cs=ct</td>
</tr>
<tr>
<td></td>
<td>• &gt;0 if cs&gt;ct</td>
</tr>
<tr>
<td>void * memcpy(void *s, const void *ct, size_t n)</td>
<td>Copies from memory. Returns s.</td>
</tr>
<tr>
<td>void * memset(void *s, int c, size_t n)</td>
<td>Sets memory to a fixed value. Returns s.</td>
</tr>
<tr>
<td>char * strcat(char *s, const char *ct)</td>
<td>Appends to a string. Returns s.</td>
</tr>
<tr>
<td>int strcmp(const char *, const char *)</td>
<td>Compares two strings. Return &lt;0 if cs&lt;ct, 0 if cs=ct, or &gt;0 if cs&gt;ct.</td>
</tr>
<tr>
<td>char * strcpy(char *s, const char *ct)</td>
<td>Copies a string. Returns s.</td>
</tr>
<tr>
<td>size_t strlen(const char *cs)</td>
<td>Returns the length of string cs.</td>
</tr>
<tr>
<td>int strncmp(char *, char *, int)</td>
<td>Compare two strings, but only specified number of characters.</td>
</tr>
<tr>
<td>int strncpy(char *, char *, int)</td>
<td>Copies a string, but only specified number of characters.</td>
</tr>
</tbody>
</table>

**Miscellaneous Intrinsics**

The following tables list and describe intrinsics that you can use across all Intel® architectures, except where noted. These intrinsics are available for both Intel® and non-Intel microprocessors but they may perform additional optimizations for Intel® microprocessors than they perform for non-Intel microprocessors.

**NOTE**

Note support for casting functions for various INT and FP types for use across Intel® architectures intrinsic functions only change the type, do not convert between integer and floating point values.

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__cpuid</td>
<td>Queries the processor for information about processor type and supported features. The Intel® C++ Compiler supports the Microsoft® implementation of this intrinsic. See the Microsoft documentation for details.</td>
</tr>
<tr>
<td>void * _alloca(int)</td>
<td>Allocates memory in the local stack frame. The memory is automatically freed upon return from the function.</td>
</tr>
<tr>
<td>int _bit_scan_forward(int x)</td>
<td>Returns the bit index of the least significant set bit of x. If x is 0, the result is undefined.</td>
</tr>
</tbody>
</table>
### Intrinsic Description

#### Intrinsic for all Supported Intel® Architectures

- **int _bit_scan_reverse(int)**
  - Returns the bit index of the most significant set bit of `x`. If `x` is 0, the result is undefined.

- **unsigned char _BitScanForward(unsigned __int32 *p, unsigned __int32 b);**
  - Sets `*p` to the bit index of the least significant set bit of `b` or leaves it unchanged if `b` is zero. The function returns a non-zero result when `b` is non-zero and returns zero when `b` is zero.

- **unsigned char _BitScanReverse(unsigned __int32 *p, unsigned __int32 b);**
  - Sets `*p` to the bit index of the most significant set bit of `b` or leaves it unchanged if `b` is zero. The function returns a non-zero result when `b` is non-zero and returns zero when `b` is zero.

- **unsigned char _bittest(__int32 *p, __int32 b);**
  - Returns the bit in position `b` of the memory addressed by `p`.

- **unsigned char _bittestandcomplement(__int32 *p, __int32 b);**
  - Returns the bit in position `b` of the memory addressed by `p`, then compliments that bit.

- **unsigned char _bittestandreset(__int32 *p, __int32 b);**
  - Returns the bit in position `b` of the memory addressed by `p`, then resets that bit to 0.

- **unsigned char _bittestandset(__int32 *p, __int32 b);**
  - Returns the bit in position `b` of the memory addressed by `p`, then sets the bit to 1.

- **unsigned char _BitScanForward64(unsigned __int32 *p, unsigned __int64 b);**

- **unsigned char _BitScanReverse64(unsigned __int32 *p, unsigned __int64 b);**

- **unsigned char _bittest64(__int64 *p, __int64 b);**

- **unsigned char _bittestandcomplement64(__int64 *p, __int64 b);**

- **unsigned char _bittestandreset64(__int64 *p, __int64 b);**

- **unsigned char _bittestandset64(__int64 *p, __int64 b);**
Intrinsic Description

Intrinsics for all Supported Intel® Architectures

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>unsigned char</strong></td>
<td>_bittestandset64(__int64 *p, __int64 b);</td>
</tr>
</tbody>
</table>

Reverses the byte order of \( x \). Swaps 4 bytes; bits 0-7 are swapped with bits 24-31, bits 8-15 are swapped with bits 16-23.

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>int _bswap(int)</strong></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>__int64 _bswap64(__int64 x)</strong></td>
<td></td>
</tr>
</tbody>
</table>

Reverses the byte order of \( x \). Swaps 8 bytes; bits 0-7 are swapped with bits 56-63, bits 8-15 are swapped with bits 48-55, bits 16-23 are swapped with bits 40-47, and bits 24-31 are swapped with bits 32-39.

<table>
<thead>
<tr>
<th>Intrinsic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>unsigned int</strong></td>
<td>_cacheSize(unsigned int cacheLevel)</td>
</tr>
</tbody>
</table>

\_cacheSize(n) returns the size in kilobytes of the cache at level \( n \). 1 represents the first-level cache. 0 is returned for a non-existent cache level. For example, an application may query the cache size and use it to select block sizes in algorithms that operate on matrices.

<table>
<thead>
<tr>

<td>int _setjmp(jmp_buf)</td>
<td>A fast version of setjmp(), which bypasses the termination handling. Saves the callee-save registers, stack pointer and return address.</td>
</tr>
<tr>
<td>int __pin_value(char *annotation)</td>
<td>Bypasses code that executes only in PIN mode. Especially useful with Intel® Threading Building Blocks, which adds specified annotations to the object file so that code is executed in PIN mode.</td>
</tr>
</tbody>
</table>

#### _may_i_use_cpu_feature

Queries the processor dynamically at the source level (this intrinsic does not perform a vendor check) to determine if processor-specific features are available.

**Syntax**

```c
extern int _may_i_use_cpu_feature(unsigned __int64);
```

**Arguments**

- **unsigned __int64**
  an unsigned __int64 bitset representing one or more cpuid features. The arguments for feature query accepted by this intrinsics are:
  
  - _FEATURE_GENERIC_IA32
  - _FEATURE_FPU
  - _FEATURE_CMOV
  - _FEATURE_MMX
FEATURE_FXSAVE
FEATURE_SSE
FEATURE_SSE2
FEATURE_SSE3
FEATURE_SSSE3
FEATURE_SSE4_1
FEATURE_SSE4_2
FEATURE_POPCNT
FEATURE_MOVBE
FEATURE_PCLMULQDQ
FEATURE_AES
FEATURE_F16C
FEATURE_AVX
FEATURE_RD.failureND
FEATURE_FMA
FEATURE_BMI
FEATURE_LZCNT
FEATURE_HLE
FEATURE_RTM
FEATURE_AVX2
FEATURE_ADX
FEATURE_RDSEED
FEATURE_AVX512DQ
FEATURE_AVX512F
FEATURE_AVX512ER
FEATURE_AVX512PF
FEATURE_AVX512CD
FEATURE_AVX512BW
FEATURE_AVX512VL
FEATURE_SHA
FEATURE_MFX
FEATURE_AVX512IFMA52
FEATURE_AVX512VBMI
FEATURE_AVX512_4FMAPS
FEATURE_AVX512_4VNNIW
Description

This intrinsic queries the processor on which it is running to check the availability of the given features. This check is dynamically performed at the point in the source where it is called. For example:

```c
if (_may_i_use_cpu_feature(_FEATURE_SSE4_2)) {
    Use SSE4.2 intrinsics;
} Else {
    Use generic code;
}
```

The `_may_i_use_feature` intrinsic, in this case, dynamically checks if the code is being executed on a processor that supports SSE4.2, and returns `true` if it is supported, or `false`. The `_may_i_use_feature` also accepts multiple features within a single argument, for example:

```c
if (_may_i_use_cpu_feature(_FEATURE_SSE | _FEATURE_SSE2 | _FEATURE_SSE3 | _FEATURE_SSSE3 | _FEATURE_MOVBE) && !_may_i_use_cpu_feature(_FEATURE_SSE4_1)) {
    printf("\nYou are running on an Atom processor."");
}
```

This intrinsic does not perform processor vendor checks that other features do (`-m <cpu>` type option).

Returns

Result of the feature query, true or false (1 or 0) for whether the set of features is available on the machine on which the intrinsic is executed.

See Also

m compiler option
Processor Targeting
[Q]ax compiler option
optimization_parameter

_allow_cpu_features

_Tells the compiler that the code region may be targeted for processors with the specified features._
_The compiler may then generate optimized code for the specified features._

Syntax

```c
extern void _allow_cpu_features(unsigned __int64);
```

Arguments

`unsigned __int64` an unsigned __int64 bitset representing one or more cpuid features:

- _FEATURE_GENERIC_IA32
- _FEATURE_FPU
- _FEATURE_CMOV
_FEATURE_MMX
_FEATURE_FXSAVE
_FEATURE_SSE
_FEATURE_SSE2

Description

Use this intrinsic function to use the specified processor feature at a code block level. The function only affects the scope of the code following the function call. Ensure that the code block will run only on processors with the specified features. If the code runs on a processor without the specified feature, the program may fail with an illegal instruction exception.

The function accepts a single argument that is a bitmask. In cases where one ISA depends on another, the higher ISA typically implies the lower. For example, the following arguments produce the same assembly code:

- _FEATURE_SSE2 | _FEATURE_AVX | _FEATURE_AVX512F
- _FEATURE_AVX512F

The argument can only add features to those specified by the [Q]x or -m (Linux* and macOS*) or /arch (Windows*) options, it cannot remove features.

This function does not itself cause the compiler to generate multiple code paths. To do that, you need to use _may_i_use_cpu_feature().

NOTE
See the Release Notes for the latest information about this function.

To use specified processor features at a function level, use the cpu_dispatch or the cpu_specific attribute or the optimization_parameter pragma.

To use specified processor features at the file level, use the [Q]x compiler option.

The following example demonstrates how to use this intrinsic function to allow the compiler to generate the necessary code to use the Advanced Vector Extensions (AVX) and Streaming SIMD Extensions 2 (SSE2) features in the processor.

```c
#include <string.h>
#include <immintrin.h>

#define MAXIMGS       20
#define MAXNAME       512

typedef struct {
    int x;      /* image X axis size */
    int y;      /* image Y axis size */
    int bpp;    /* image bits */
    char name[MAXNAME]; /* image full filename */
    unsigned char * data; /* pointer to raw byte image data */
} rawimage;

typedef struct {
    int x;      /* image X axis size */
    int y;      /* image Y axis size */
    int bpp;    /* image bits */
    char name[MAXNAME]; /* image full filename */
    unsigned char * data; /* pointer to raw byte image data */
} rawimage;

extern rawimage * imagelist[MAXIMGS];
extern int numimages;

rawimage* CreateImage(char * filename)
{
    rawimage* newimage = NULL;
    int i, len, intable;

    intable=0;
    if (numimages!=0) {
        _allow_cpu_features(_FEATURE_SSE2 | _FEATURE_AVX);
    }
```
for (i=0; i<numimages; i++) {
    if (!strcmp(filename, imagelist[i]->name)) {
        newimage=imagelist[i];
        intable=1;
    }
}

if (!intable) {
    newimage=(rawimage *)malloc(sizeof(rawimage));
    if (newimage != NULL) {
        strcpy(newimage->name, filename);
        imagelist[numimages]=newimage; /* add new one to the table */
        numimages++;
    /* increment the number of images */
    }
}
return newimage;

Returns
Returns nothing.

Data Alignment, Memory Allocation Intrinsics, and Inline Assembly

Overview: Data Alignment, Memory Allocation Intrinsics, and Inline Assembly
This section describes features that support usage of the intrinsics. The following topics are described:

- Alignment Support
- Allocating and Freeing Aligned Memory Blocks
- Inline Assembly
Alignment Support

Aligning data improves the performance of intrinsics. When using the Intel® Streaming SIMD Extensions (Intel® SSE) intrinsics, you should align data to 16 bytes in memory operations. Specifically, you must align __m128 objects as addresses passed to the _mm_load and _mm_store intrinsics. If you want to declare arrays of floats and treat them as __m128 objects by casting, you need to ensure that the float arrays are properly aligned.

Use __declspec(align) to direct the compiler to align data more strictly than it otherwise would. For example, a data object of type int is allocated at a byte address which is a multiple of 4 by default. By using __declspec(align), you can direct the compiler to instead use an address which is a multiple of 8, 16, or 32 (with the following restriction on IA-32 architecture: 16-byte addresses can be locally or statically allocated).

You can use this data alignment support as an advantage in optimizing cache line usage. By clustering small objects that are commonly used together into a struct, and forcing the struct to be allocated at the beginning of a cache line, you can effectively guarantee that each object is loaded into the cache as soon as any one is accessed, resulting in a significant performance benefit.

For 16-byte alignment, you can use the macro __MM_ALIGN16, which other compilers can support by including header files. This macro enables you to write portable code that does not rely on compiler support for __declspec(align).

See Also

__declspec(align) declaration

Programming Example includes example of __MM_ALIGN16

Allocating and Freeing Aligned Memory Blocks

To allocate and free aligned blocks of memory use the _mm_malloc and _mm_free intrinsics. These intrinsics are based on malloc and free, which are in the libirc.a library. You need to include malloc.h. The syntax for these intrinsics is as follows:

```c
void* _mm_malloc (size_t size, size_t align )
void _mm_free (void *p)
```

The _mm_malloc routine takes an extra parameter, which is the alignment constraint. This constraint must be a power of two. The pointer that is returned from _mm_malloc is guaranteed to be aligned on the specified boundary.

**NOTE**
Memory that is allocated using _mm_malloc must be freed using _mm_free. Calling free on memory allocated with _mm_malloc or calling _mm_free on memory allocated with malloc will cause unpredictable behavior.
Inline Assembly

Microsoft* Style Inline Assembly
The Intel® C++ Compiler supports Microsoft-style inline assembly on Windows*. The Intel® C++ Compiler supports Microsoft-style inline assembly on Linux* when used with the -use-msasm option. See the Microsoft documentation for the proper syntax.

GNU*-like Style Inline Assembly (IA-32 architecture and Intel® 64 architecture only)
The Intel® C++ Compiler supports GNU-like style inline assembly. The syntax is as follows:

```
asm-keyword [ volatile-keyword ] ( asm-template [ asm-interface ] ) ;
```

The Intel® C++ Compiler also supports mixing UNIX* and Microsoft* style asms. Use the __asm__ keyword for GNU-style ASM when using the -use_msasm switch.

**NOTE**
The Intel® C++ Compiler supports gcc-style inline ASM if the assembler code uses AT&T* System V/386 syntax.

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>asm-keyword</td>
<td>Assembly statements begin with the keyword asm. Alternatively, either __asm or <strong>asm</strong> may be used for compatibility. When mixing UNIX* and Microsoft* style asm, use the <strong>asm</strong> keyword. The compiler only accepts the <strong>asm</strong> keyword. The asm and <strong>asm</strong> keywords are reserved for Microsoft* style assembly statements.</td>
</tr>
<tr>
<td>volatile-keyword</td>
<td>If the optional keyword volatile is given, the asm is volatile. Two volatile asm statements are never moved past each other, and a reference to a volatile variable is not moved relative to a volatile asm. Alternate keywords __volatile and <strong>volatile</strong> may be used for compatibility.</td>
</tr>
<tr>
<td>asm-template</td>
<td>The asm-template is a C language ASCII string that specifies how to output the assembly code for an instruction. Most of the template is a fixed string; everything but the substitution-directives, if any, is passed through to the assembler. The syntax for a substitution directive is a % followed by one or two characters.</td>
</tr>
<tr>
<td>asm-interface</td>
<td>The asm-interface consists of three parts: 1. An optional output-list 2. An optional input-list 3. An optional clobber-list These are separated by colon (:) characters. If the output-list is missing, but an input-list is given, the input list may be preceded by two colons (::) to take the place of the missing output-list. If the asm-interface is omitted altogether, the asm statement is considered volatile regardless of whether a volatile-keyword was specified.</td>
</tr>
<tr>
<td>Syntax Element</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>output-list</td>
<td>An output-list consists of one or more output-specs separated by commas. For the purposes of substitution in the asm-template, each output-spec is numbered. The first operand in the output-list is numbered 0, the second is 1, and so on. Numbering is continuous through the output-list and into the input-list. The total number of operands is limited to 30 (i.e. 0-29).</td>
</tr>
<tr>
<td>input-list</td>
<td>Similar to an output-list, an input-list consists of one or more input-specs separated by commas. For the purposes of substitution in the asm-template, each input-spec is numbered, with the numbers continuing from those in the output-list.</td>
</tr>
<tr>
<td>clobber-list</td>
<td>A clobber-list tells the compiler that the asm uses or changes a specific machine register that is either coded directly into the asm or is changed implicitly by the assembly instruction. The clobber-list is a comma-separated list of clobber-specs.</td>
</tr>
<tr>
<td>input-spec</td>
<td>The input-specs tell the compiler about expressions whose values may be needed by the inserted assembly instruction. In order to describe fully the input requirements of the asm, you can list input-specs that are not actually referenced in the asm-template.</td>
</tr>
<tr>
<td>clobber-spec</td>
<td>Each clobber-spec specifies the name of a single machine register that is clobbered. The register name may optionally be preceded by a %. You can specify any valid machine register name. It is also legal to specify &quot;memory&quot; in a clobber-spec. This prevents the compiler from keeping data cached in registers across the asm statement.</td>
</tr>
</tbody>
</table>

When compiling an assembly statement on Linux*, the compiler simply emits the asm-template to the assembly file after making any necessary operand substitutions. The compiler then calls the GNU* assembler to generate machine code. In contrast, on Windows* the compiler itself must assemble the text contained in the asm-template string into machine code. In essence, the compiler contains a built-in assembler.

The compiler’s built-in assembler supports the GNU* .byte directive but does not support other functionality of the GNU* assembler, so there are limitations in the contents of the asm-template. The following assembler features are not currently supported.

- Directives other than the .byte directive
- Symbols*

**NOTE**

* Direct symbol references in the asm-template are not supported. To access a C++ object, use the asm-interface with a substitution directive.

**Example**

Incorrect method for accessing a C++ object:

```c
__asm__("addl $5, _x");
```

Proper method for accessing a C++ object:

```c
__asm__("addl $5, %0" : "+rm" (x));
```
Additionally, there are some restrictions on the usage of labels. The compiler only allows local labels, and only references to labels within the same assembly statement are permitted. A local label has the form "N:", where N is a non-negative integer. N does not have to be unique, even within the same assembly statement. To reference the most recent definition of label N, use "Nb". To reference the next definition of label N, use "Nf". In this context, "b" means backward and "f" means forward. For more information, refer to the GNU assembler documentation.

GNU-style inline assembly statements on Windows* use the same assembly instruction format as on Linux* which is often referenced as AT&T* assembly syntax. This means that destination operands are on the right and source operands are on the left. This operand order is the reverse of Intel assembly syntax.

Due to the limitations of the compiler’s built-in assembler, many assembly statements that compile and run on Linux* will not compile on Windows*. On the other hand, assembly statements that compile and run on Windows* should also compile and run on Linux*.

This feature provides a high-performance alternative to Microsoft-style inline assembly statements when portability between Windows*, Linux*, and macOS* is important. Its intended use is in small primitives where high-performance integration with the surrounding C++ code is essential.

```c
#ifndef _WIN64
#define INT64_PRINTF_FORMAT "I64"
#else
#define __int64 long long
#define INT64_PRINTF_FORMAT "L"
#endif
#include <stdio.h>
typedef struct {
    __int64 lo64;
    __int64 hi64;
} my_i128;
#define ADD128(out, in1, in2)                      
    __asm__("addq %2, %0; adcq %3, %1" :           
        "=r"(out.lo64), "=r"(out.hi64) :       
        "emr"(in2.lo64), "emr"(in2.hi64),     
        "0"(in1.lo64), "1"(in1.hi64));

typedef struct {
    __int64 lo64;
    __int64 hi64;
} my_i128;
#define ADD128(out, in1, in2)                      
    __asm__("addq %2, %0; adcq %3, %1" :           
        "=r"(out.lo64), "=r"(out.hi64) :       
        "emr"(in2.lo64), "emr"(in2.hi64),     
        "0"(in1.lo64), "1"(in1.hi64));
extern int
main() {
    my_i128 val1, val2, result;
    val1.lo64 = ~0;
    val1.hi64 = 0;
    val2.hi64 = 65;
    ADD128(result, val1, val2);
    printf("0x%016" INT64_PRINTF_FORMAT "x%016" INT64_PRINTF_FORMAT "x\n", 
        val1.hi64, val1.lo64);
    printf("0x%016" INT64_PRINTF_FORMAT "x%016" INT64_PRINTF_FORMAT "x\n", 
        val2.hi64, val2.lo64);
    printf("0x%016" INT64_PRINTF_FORMAT "x%016" INT64_PRINTF_FORMAT "x\n", 
        result.hi64, result.lo64);
    return 0;
}
```
This example, written for Intel® 64 architecture, shows how to use a GNU-style inline assembly statement to add two 128-bit integers. In this example, a 128-bit integer is represented as two __int64 objects in the my_i128 structure. The inline assembly statement used to implement the addition is contained in the ADD128 macro, which takes three my_i128 arguments representing three 128-bit integers. The first argument is the output. The next two arguments are the inputs. The example compiles and runs using the Intel® C++ Compiler on Linux® or Windows*, producing the following output.

```
0x0000000000000000ffffffffffffffff
+ 0x00000000000000410000000000000001
-----------------------------
+ 0x00000000000000420000000000000000
```

In the GNU-style inline assembly implementation, the asm interface specifies all the inputs, outputs, and side effects of the asm statement, enabling the compiler to generate very efficient code.

```
mov       r13, 0xffffffffffffffff
mov       r12, 0x000000000
add       r13, 1
adc       r12, 65
```

It is worth noting that when the compiler generates an assembly file on Windows*, it uses Intel syntax even though the assembly statement was written using AT&T* assembly syntax.

The compiler moves in1.lo64 into a register to match the constraint of operand 4. Operand 4's constraint of "0" indicates that it must be assigned the same location as output operand 0. And operand 0's constraint is "=r", indicating that it must be assigned an integer register. In this case, the compiler chooses r13. In the same way, the compiler moves in1.hi64 into register r12.

The constraints for input operands 2 and 3 allow the operands to be assigned a register location ("r"), a memory location ("m"), or a constant signed 32-bit integer value ("e"). In this case, the compiler chooses to match operands 2 and 3 with the constant values 1 and 65, enabling the add and adc instructions to utilize the "register-immediate" forms.

The same operation is much more expensive using a Microsoft-style inline assembly statement, because the interface between the assembly statement and the surrounding C++ code is entirely through memory. Using Microsoft* assembly, the ADD128 macro might be written as follows.

```
#define ADD128(out, in1, in2)                      
{                                              
__asm mov rax, in1.lo64                    
__asm mov rdx, in1.hi64                    
__asm add rax, in2.lo64                    
__asm adc rdx, in2.hi64                    
__asm mov out.lo64, rax                    
__asm mov out.hi64, rdx                    
}                                              
```

The compiler must add code before the assembly statement to move the inputs into memory, and it must add code after the assembly statement to retrieve the outputs from memory. This prevents the compiler from exploiting some optimization opportunities. Thus, the following assembly code is produced.

```
mov QWORD PTR [rsp+32], -1
mov QWORD PTR [rsp+40], 0
mov QWORD PTR [rsp+48], 1
mov QWORD PTR [rsp+56], 65

; Begin ASM

mov rax, QWORD PTR [rsp+32]
```
The operation that took only four instructions and no memory references using GNU-style inline assembly takes twelve instructions with twelve memory references using Microsoft-style inline assembly.

**Intrinsics for Managing Extended Processor States and Registers**

**Overview: Intrinsics for Managing Extended Processor States and Registers**

The Intel® C++ Compiler provides twelve intrinsics for managing the extended processor states and extended registers. These intrinsics are available for the IA-32 and Intel® 64 architectures running on supported operating systems.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

The intrinsics map directly to the hardware system instructions described in "Intel® 64 and IA-32 Architectures Software Developer's Manual, volumes 1, 2a, and 2b" and "Intel® Advanced Vector Extensions Programming Reference".

**Functional Overview**

The intrinsics for managing the extended processor states and extended registers include:

- Two intrinsics to read from and write to the specified extended control register. These intrinsics map to `XGETBV` and `XSETBV` instructions.
- Four intrinsics to save and restore the current state of the x87 FPU, MMX, XMM, and MXCSR registers. These intrinsics map to `FXSAVE`, `FXSAVE64`, `FXRSTOR`, and `FXRSTOR64` instructions.
- Six intrinsics to save and restore the current state of the x87 FPU, MMX, YMM, and MXCSR registers. These intrinsics map to `XSAVE`, `XSAVE64`, `XSAVEOPT`, `XSAVEOPT64`, `XRSTOR`, and `XRSTOR64` instructions.

**See Also**

Intel® Advanced Vector Extensions Programming Reference

**Intrinsics for Reading and Writing the Content of Extended Control Registers**

This group of intrinsics includes two intrinsics to read from and write to extended control registers (XCRs). Currently, the only such register defined is XCR0, `XFEATURE_ENABLED_MASK` register. This register specifies the set of processor states that the operating system enables on that processor, for example x87 FPU states, SSE states, and other processor extended states that Intel® 64 architecture may introduce in the future.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```
_xgetbv()
Reads the content of an extended control register.

Syntax
extern unsigned __int64 _xgetbv(unsigned int xcr);

Arguments

_xcr
An extended control register to be read. Currently, only the value '0' is allowed.

Description
This intrinsic reads from extended control registers. Currently, the only control register allowed/defined is (XCR0) XFEATURE_ENABLED_MASK register. The corresponding constant is defined in the immintrin.h file to refer to this register:

#define _XCR_XFEATURE_ENABLED_MASK 0

This intrinsic maps to XGETBV instruction.

Returns
Returns the content of a specified extended control register.

_xsetbv()
Writes the given value to a specified extended control register.

Syntax
extern void _xsetbv(unsigned int xcr, unsigned __int64 val);

Arguments

_xcr
An extended control register to be written. Currently, only the value '0' is allowed.
**Value to be written to the specified extended control register.**

**Description**
This intrinsic writes the given value to the specified extended control register. Currently, the only control register allowed/defined is (XCR0) XFEATURE_ENABLED_MASK register. The corresponding constant is defined in the immintrin.h file to refer to this register:

```c
#define _XCR_XFEATURE_ENABLED_MASK 0
```

This intrinsic maps to XSETBV instruction.

---

**Intrinsics for Saving and Restoring the Extended Processor States**

To use any of these intrinsics, include the immintrin.h file as follows:

```c
#include <immintrin.h>
```

**Intrinsics that map to FXSAVE[64] and FXRSTOR[64] instructions**

This group of intrinsics includes four intrinsics to save and restore the current state of the x87 FPU, MMX, XMM, and MXCSR registers.

These intrinsics accept a memory reference to a 16-byte aligned 512-byte memory chunk. The layout of the memory is shown below in Table 1.

**Table 1 - FXSAVE save area layout.**
Intrinsics that map to XSAVE[64], XSAVEOPT[64], and XRSTOR[64] instructions

This group of intrinsics includes six intrinsics to fully or partially save and restore the current state of the x87 FPU, MMX, XMM, YMM, and MXCSR registers.

These intrinsics accept a memory reference to a 64-byte aligned memory. The layout of the register fields for the first 512 bytes is the same as the FXSAVE save area layout. The intrinsics saving the states do not write to bytes 464:511. The save area layout is shown in Tables 2a and 2b below.

The second operand is a save/restore mask specifying the saved/restored extended states. The value of the mask is ANDed with XFEATURE_ENABLED_MASK(XCR0). A particular extended state is saved/restored only if the corresponding bit of both save/restore mask and XFEATURE_ENABLED_MASK is set to '1'.
Table 2a - XSAVE save area layout (first 512 bytes)

_fxsave()

Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory.

Syntax

extern void _fxsave(void *mem);

Arguments

mem

A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
Description
Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory. This intrinsic maps to FXSAVE instruction.

_fxsave64()
Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory.

Syntax
extern void _fxsave64(void *mem);

Arguments
mem A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description
Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory. This intrinsic maps to FXSAVE64 instruction.

_fxrstor()
Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory.

Syntax
extern void _fxrstor(void *mem);

Arguments
mem A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description
Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory. This intrinsic maps to FXRSTOR instruction.

_fxrstor64()
Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory.

Syntax
extern void _fxrstor64(void *mem);

Arguments
mem A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
Description

Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory. This intrinsic maps to FXRSTOR64 instruction.

_xsave()/_xsavec()/_xsaves()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory.

Syntax

extern void _xsave(void *mem, unsigned __int64 save_mask);
extern void _xsavec(void *mem, unsigned __int64 save_mask);
extern void _xsaves(void *mem, unsigned __int64 save_mask);

Arguments

mem

A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

save_mask

A bit mask specifying the extended states to be saved.

Description

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory. The xsave intrinsic maps to XSAVE instruction, the xsavec intrinsic maps to XSAVEC instruction, and the xsaves intrinsic maps to XSAVES instruction. See the Intel® 64 and IA-32 Architectures Software Developer’s Manual for information on how the three instructions differ.

_xsave64()/_xsavec64()/_xsaves64()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory.

Syntax

extern void _xsave64(void *mem, unsigned __int64 save_mask);
extern void _xsavec64(void *mem, unsigned __int64 save_mask);
extern void _xsaves64(void *mem, unsigned __int64 save_mask);

Arguments

mem

A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

save_mask

A bit mask specifying the extended states to be saved.

Description

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory. The xsave64 intrinsic maps to XSAVE64 instruction, the xsavec64 intrinsic maps to XSAVEC64 instruction, and the xsaves64 intrinsic maps to XSAVES64 instruction. See the Intel® 64 and IA-32 Architectures Software Developer’s Manual for information on how the three instructions differ.
_xsaveopt()
Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible.

Syntax
extern void _xsaveopt(void *mem, unsigned __int64 save_mask);

Arguments
- **mem**: A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
- **save_mask**: A bit mask specifying the extended states to be saved.

Description
Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible. This intrinsic maps to XSAVEOPT instruction.

_xsaveopt64()
Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible.

Syntax
extern void _xsaveopt64(void *mem, unsigned __int64 save_mask);

Arguments
- **mem**: A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
- **save_mask**: A bit mask specifying the extended states to be saved.

Description
Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible. This intrinsic maps to XSAVEOPT64 instruction.

_xrstor() / xrstors()
Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory.

Syntax
extern void _xrstor(void *mem, unsigned __int64 rstor_mask);
extern void _xrstors(const void *mem, unsigned __int64 rstor_mask);

Arguments
- **mem**: A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
rstor_mask

A bit mask specifying the extended states to be restored.

Description

Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory. The xrstor intrinsic maps to XRSTOR instruction, and the xrstors intrinsic maps to XRSTORS instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the instructions differ.

_xrstor64()/xrstors64()

Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory.

Syntax

extern void _xrstor64(void *mem, unsigned __int64 rstor_mask);
extern void _xrstors64(const void *mem, unsigned __int64 rstor_mask);

Arguments

mem

A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

rstor_mask

A bit mask specifying the extended states to be restored.

Description

Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory. The xrstor64 intrinsic maps to XRSTOR64 instruction, and the xrstors64 intrinsic maps to XRSTORS64 instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the instructions differ.

Intrinsics for the Short Vector Random Number Generator Library

The Short Vector Random Number Generator (SVRNG) library provides intrinsics for the IA-32 and Intel® 64 architectures running on supported operating systems. The SVRNG library partially covers both standard C++ (as referenced here: http://www.cplusplus.com/reference/random/) and the random number generation functionality of the Intel® Math Kernel Library (Intel® MKL). The SVRNG library allows users to produce random numbers using a combination of engines and distributions. "Engines” are basic generators which produce uniformly distributed 32-bit or 64-bit unsigned integer numbers. "Distributions" transform the sequences of numbers generated by an engine into sequences of numbers with specific random variable distributions, such as uniform, normal, binomial and others. The distributions support single- or double-precision floating point and 32-bit signed integer outputs.

Both scalar and vector implementations are available for SVRNG generation functions. Scalar versions return native C++ data types: float, double, and both 32- and 64-bit integers. Vector versions produce packed results using SIMD-vector registers via corresponding data types as outlined in the "Data types and calling conventions" section below. Scalar versions called in loops can be vectorized by the compiler.

Unlike simple random number generators such as rand(), SVRNG engines and distributions require initialization routines which allocate memory and pre-compute constants required for fast vector generation. Finalization routines are provided to deallocate memory. Some engines support "skip-ahead" and "leap-frog" techniques for use in parallel computing environment. The "Parallel Computation Support" section discusses
how these are used to obtain a random number sequence in parallel that is identical to the random number sequence that is generated in the sequential case. Error handling in SVRNG is done via status set and get functions. Additionally NULL pointers are returned on errors when possible.

SVRNG SIMD-vector functions and corresponding vectorized scalar calls are highly optimized for the following instructions sets:

- Intel® Streaming SIMD Extensions 2 (Intel® SSE2) (default)
- Intel® Advanced Vector Extensions 2 (Intel® AVX2)
- Intel® Initial Many Integrated Core Instructions (Intel® IMIC Instructions)
- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions (on Intel® Many Integrated Core architectures and elsewhere)

Further Reference

The following documents are referenced in this section to provide further detail:

Data Types and Calling Conventions

Data types specific to the Short Vector Random Number Generator (SVRNG) Library

There are two types of SVRNG functions: the initialization and service routines and generation functions. The initialization and service routines introduce two new data types:

<table>
<thead>
<tr>
<th>svrng_engine_t</th>
<th>A pointer to the engine-specific data structure created by the engine initialization routine. The structure contains pre-computed constants necessary for fast and precise random number vector generation by the engine. The structure size is engine-dependent.</th>
</tr>
</thead>
<tbody>
<tr>
<td>svrng_distribution_t</td>
<td>A pointer to the distribution-specific data structure created by the distribution initialization routine. The structure contains pre-computed loop invariant constants to perform distribution transformations efficiently. The structure size is distribution-dependent.</td>
</tr>
</tbody>
</table>

While scalar SVRNG generation functions return native "C" data types (float, double, 32-bit and 64-bit integers), the SIMD-vector versions produce 1, 2, 4, 8, 16, or 32 packed results in one or several SIMD-vector registers. A set of SVRNG-specific vector types have been introduced to return these packed results. These types are CPU-specific and mapped to different numbers of SIMD-registers depending on the architecture where the program runs:

<table>

1 SIMD-functions with 1 "packed" result have been added mostly for consistency and easy transfer of manually-written intrinsic pieces of code to different length sections (including length=1) — in other words, for "peeling", "unrolling", or "clean-up".

2 Note that SVRNG does not have optimizations specific to the Intel® Advanced Vector Extensions (Intel® AVX) instruction set. On hardware that supports Intel® AVX the Intel® Streaming SIMD Extensions 2 (Intel® SSE2) instruction default versions are called, so you must use the Intel® SSE2 data types to interpret the results.

SVRNG calling conventions

All SVRNG routines use the regcall calling convention which provides the most use of hardware vector registers for passing parameters and returning results. See the "C/C++ Calling Conventions" section and the "_vectorcall and __regcall demystified" article referenced in the Introduction. This avoids unnecessary memory spills and fills of registers and improves performance.

In addition this convention provides the opportunity to deploy the "vector variant" declaration feature specific to the Intel® compiler. The declaration specifies a vector variant function that corresponds to its original C/C++ scalar function. This vector variant function can be invoked in vector context at the site of the call. See the vector_variant section for more detail. All SIMD-vector SVRNG intrinsics (except packed length = 1) are declared in the svrng.h header file as vector_variant to support automatic vectorization.

vector_variant
Usage Model

A typical usage model for using the intrinsics in the Short Vector Random Number Generator (SVRNG) library is the same as for standard C++ or Intel® Math Kernel Library (Intel® MKL) vector statistics random number generator and looks something like the following:

- Include `svrng.h` header file
- Create and initialize basic SVRNG generator engine, create and initialize distribution (if necessary).
- Call one or more SVRNG generation function.
- Process the output.
- Delete the SVRNG engines and distributions.

On Windows*, users will need to explicitly link the static or dynamic libraries: static: `libirng.lib`, dynamic: `libirngmd.lib`. On Linux* and macOS* the compiler driver will link automatically.

The following example demonstrates generation of a random stream that is output of basic generator engine MT19937 with seed equal to 777. The engine is used to generate two arrays: 1024 uniformly distributed random numbers between \(a = 0.0, b = 4.0\) via scalar generator call which should be vectorized by the compiler and 1024 normally distributed with parameters \(\text{mean} = 2.0, \text{standard deviation} = 1.0\) random numbers in blocks by 16 elements via direct call of SIMD-vector implementation. Delete engines and distributions after completing the generation. Check status for possible errors happened. The purpose of the example is to calculate the sample mean for both distributions with the given parameters.

```c
#include <stdio.h>
#include <svrng.h>

int main( void )
{
    int                   i, st = SVRNG_STATUS_OK;
    double                res1[1024],  res2[1024];
    double                sum1 = 0, sum2 = 0;
    double                mean1, mean2;
    svrng_engine_t        engine;
    svrng_distribution_t  distr1, distr2;

    /* Create mt19937 engine */
    engine = svrng_new_mt19937_engine( 777 );

    /* Create uniform distribution */
    distr1 = svrng_new_uniform_distribution_double( 0.0, 4.0 );

    /* Create normal distribution */
    distr2 = svrng_new_normal_distribution_double( 2.0, 1.0 );

    /* Scalar generator call, can be vectorized by compiler */
    #pragma ivdep
    #pragma vector always
    for( i = 0; i < 1024; i ++ ) {
        res1[i] = svrng_generate_double( engine, distr1 );
    }

    /* Direct call to SIMD-vector implementation */
    /* generating 16 packed elements */
    for( i = 0; i < 1024; i += 16 ) {
        *((svrng_double16_t*)(&res2[i])) =
            svrng_generate16_double( engine, distr2 );
    }
}
```
/* Compute mean values */
for( i = 0; i < 1024; i++ ) {
    sum1 += res1[i];
    sum2 += res2[i];
}

mean1 = sum1 / 1024.0;
mean2 = sum2 / 1024.0;

/* Printing results */
printf( "Sample mean of uniform distribution = %f\n", mean1 );
printf( "Sample mean of normal  distribution = %f\n", mean2 );

/* Check for resulted status */
st = svrng_get_status();

if( st != SVRNG_STATUS_OK ) {
    printf( "FAILED: status error %d returned\n", st );
}

/* Delete distributions */
svrng_delete_distribution( distr1 );
svrng_delete_distribution( distr2 );

/* Delete engine */
svrng_delete_engine( engine );
return st;

Another example demonstrates the "skip-ahead" technique which ensures identical random number sequences in cases of parallel and sequential generation for certain engines. The rand0 engine is being created and copied to T "threads" with the "skip-ahead" adjustments applied. Each "thread" generates N uniformly distributed unsigned integer random values and then all LEN=T*N numbers are compared to the sequential call:

#include <stdio.h>
#include <stdint.h>
#include <svrng.h>

#define LEN        1024
#define T          8
#define N          (LEN/T)

int main( void ) {
    uint32_t seq_res[LEN+32], parallel_res[LEN+32];
    svrng_engine_t seq_engine;
    svrng_engine_t parallel_engine[T];
    int l, n, t, errs = 0, st = SVRNG_STATUS_OK;

    /* Create sequential engine and distr */
    seq_engine = svrng_new_rand0_engine( 777 );

    /* Copy existing sequential engine to new T parallel ones */
    /* with t*N offsets using skipahead method */
    for( t = 0; t < T; t++ ) {
        int thr_offset = t*N;
        parallel_engine[t] = svrng_copy_engine( seq_engine );
    }
parallel_engine[t] = \
    svrng_skipahead_engine( parallel_engine[t], thr_offset );
}

/* Sequential loop using scalar function (can be vectorized) */
#pragma ivdep
#pragma vector always
for( l = 0; l < LEN; l++ ) {
    seq_res[l] = svrng_generate_uint( seq_engine );
}

/* Parallel loop using SIMD-vector function, */
/* may be spreaded by threads */
for( t = 0; t < T; t++ ) {
    for( n = 0; n < N; n += 8 ) {
        *((svrng_uint8_t*)(&(parallel_res[t*N+n]))) = \
            svrng_generate8_uint( parallel_engine[t] );
    }
}

/* Compare seq and parallel results */
for(l = 0; l < LEN; l++) {
    if( parallel_res[l] != seq_res[l]) {
        errs++;
    }
}

/* Check for resulted status */
st = svrng_get_status();

/* Print overall result */
if(st != SVRNG_STATUS_OK) {
    printf("FAILED: status error %d returned\n", st);
} else if(errs) {
    printf("FAILED: %d skipahead errors\n", errs);
} else {
    printf("PASSED\n");
}

/* Delete engines */
svrng_delete_engine( seq_engine );
for( t = 0; t < T; t++ ) {
    svrng_delete_engine(parallel_engine[t]);
}
return (errs-st);

Engine Initialization and Finalization

Unlike the simple rand() function, vector random number generators in the Short Vector Random Number Generator (SVRNG) library require the initialization of an engine before the first generator run. This is due to the fact that a number of initialization values called the "vector state" of the engine must be pre-computed to perform effective vector generation. Once computed that vector state is retained and updated in memory as
more numbers are generated. When no more random numbers are needed, that memory can be deallocated. The next few topics provide the functions used to allocate memory, initialize, and deallocate memory for all supported SVRNG engines.

The SVRNG library supports the following engines from the C++11 standard and the Intel® Math Kernel Library (Intel® MKL) vector statistics random number generator collection:

- **rand0** (C++11 standard)
- **rand** (C++11 standard)
- **mcg31m1** (Intel® MKL)
- **mcg59** (Intel® MKL)
- **mt19937** (Intel® MKL and C++11 standard)

For more information on the "figures of merit" for these random number generator engines read the "Basic Random Generator Properties and Testing Results" section of the Notes for Intel® MKL Vector Statistics document (see the introduction).

For each engine there is a simple and extended version of the initialization function. Simple initialization has one parameter, the "seed", and constructs the rest of the vector state to generate the proper sequence for the engine type. The extended versions of the initialization functions, with the "_ex" suffix, use multiple constants to set generator state values. The application notes in the description of each engine provide more detail on how these constants are used. The usual case for extended initialization requires enough constants to fill a SIMD register with 64-bit values on the system which the program is intended to run. The following table sums up the width (SIMD_WIDTH) of the SIMD registers used by the instructions sets for which the SVRNG intrinsics are optimized:

<table>
<thead>
<tr>
<th>Instruction set</th>
<th>SIMD_WIDTH</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Intel® Initial Many Integrated Core Instructions (Intel® IMIC Instructions)</td>
<td></td>
</tr>
</tbody>
</table>

**See Also**

Introduction

**svrng_new_rand0_engine/svrng_new_rand0_ex**

*Routines for allocating memory for a rand0 engine and initializing with one or multiple seeds*

**Syntax**

```c
svrng_engine_t svrng_new_rand0_engine( uint32_t seed )
svrng_engine_t svrng_new_rand0_engine_ex( int num, uint32_t *pseed )
```

**Input Parameters**

- **seed**

  Initial condition for the engine.
The `svrng_new_rand_engine` function allocates memory for the rand0 engine originated from C++11 standard and initializes it using one `seed` value. The extended version of the function, `svrng_new_rand_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

### Status flags set

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SVRNG_STATUS_ERROR_MEMORY_ALLOC</code></td>
<td>Memory allocation failure</td>
</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_PARAM1</code></td>
<td>Bad parameter: <code>num</code></td>
</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_PARAM2</code></td>
<td>Bad parameter: <code>pseed</code></td>
</tr>
</tbody>
</table>

### Return Values

A pointer to an initialized engine or NULL on error.

### Application Notes

The rand0 engine is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

\[
x_{i+1} = (a \times x_i) \mod m
\]

- **multiplier** \(a = 16807 = 7^5\)
- **modulus** \(m = 2147483647 = 2^{31} - 1\)
  
Range: \([0, MAX)\), where \(MAX = m\)

### svrng_new_rand_engine/svrng_new_rand_ex

*Routines for allocating memory for a rand engine and initializing with one or multiple seeds*

### Syntax

```c
svrng_engine_t svrng_new_rand_engine( uint32_t seed )
svrng_engine_t svrng_new_rand_engine_ex( int num, uint32_t *pseed )
```

### Input Parameters

- **seed**
  
Initial condition for the engine.

- **num**
  
Number of initialization values for the extended routine. May be 0 ( `seed` set to 1 ), 1 ( `seed` set to `pseed[0]` ), or `SIMD_WIDTH`.

- **pseed**
  
Pointer to an array with initialization values for the extended routine.
Description

The `svrng_new_rand_engine` function allocates memory for the rand engine (originated from C++ 11 standard) and initializes it using one seed value. The extended version of the function, `svrng_new_rand_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

Status flags set

<table>

</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_PARAM2</code></td>
<td>Bad parameter: pseed</td>
</tr>
</tbody>
</table>

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The rand is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

\[ x_{i+1} = (a \times x_i) \mod m \]

multiplier \( a = 48271 \)

modulus \( m = 2147483647 = 2^{31} - 1 \)

Range: \([0, \text{MAX}), \text{where MAX} = m\)

`svrng_new_mcg31m1_engine/svrng_new_mcg31m1_ex`

Routines for allocating memory for a mcg31m1 engine and initializing with one or multiple seeds.

Syntax

```c
svrng_engine_t svrng_new_mcg31m1_engine( uint32_t seed )
svrng_engine_t svrng_new_mcg31m1_engine_ex( int num, uint32_t *pseed )
```

Input Parameters

- `seed` Initial condition for the engine.
- `num` Number of initialization values for the extended routine. May be 0 (seed set to 1), 1 (seed set to `pseed[0]`), or SIMD_WIDTH.
- `pseed` Pointer to an array with initialization values for the extended routine.
Description

The `svrng_new_mcg31m1_engine` function allocates memory for the mcg31m1 engine (originated from C++ 11 standard) and initializes it using one `seed` value. The extended version of the function, `svrng_new_mcg31m1_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

<td>Bad parameter: <code>num</code></td>
</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_PARAM2</code></td>
<td>Bad parameter: <code>pseed</code></td>
</tr>
</tbody>
</table>

### Return Values

A pointer to an initialized engine or NULL on error.

### Application Notes

The mcg31m1 is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

\[ x_{i+1} = (a \times x_i) \mod m \]

multiplier \( a = 1132489760 \)

modulus \( m = 2147483647 (=2^{31}-1) \) Range: \([0,MAX)\), where \(MAX = m\)

### svrng_new_mcg59_engine/svrng_new_mcg59_ex

**Routines for allocating memory for a mcg59 engine and initializing with one or multiple seeds**

#### Syntax

```c
svrng_engine_t svrng_new_mcg59_engine( uint32_t seed )
svrng_engine_t svrng_new_mcg59_engine_ex( int num, uint32_t *pseed )
```

#### Input Parameters

- **seed**
  - Initial condition for the engine.

- **num**
  - Number of initialization values for the extended routine. May be 0 (`seed` set to 1), 1 (`seed` set to `pseed[0]`), or SIMD_WIDTH.

- **pseed**
  - Pointer to an array with initialization values for the extended routine.

#### Description

The `svrng_new_mcg59_engine` function allocates memory for the mcg59 engine (originated from C++ 11 standard) and initializes it using one `seed` value. The extended version of the function, `svrng_new_mcg59_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.
Status flags set

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

<td>SVRNG_STATUS_ERROR_BAD_PARAM1</td>
<td>Bad parameter: num</td>
</tr>
<tr>
<td>SVRNG_STATUS_ERROR_BAD_PARAM2</td>
<td>Bad parameter: pseed</td>
</tr>
</tbody>
</table>

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The mcg59 is a simple 64-bit multiplicative congruential pseudo-random number generator represented by formula:

\[ x_{i+1} = (a \cdot x_i) \mod m \]

multiplier \( a = 13^{13} \)

modulus \( m = 2^{59} \) Range: \([0, \text{MAX}), \text{where } \text{MAX} = m\)

svrng_new_mt19937_engine/svrng_new_mt19937_ex

Routines for allocating memory for an mt19937 engine and initializing with one or multiple seeds

Syntax

svrng_engine_t svrng_new_mt19937_engine( uint32_t seed )

svrng_engine_t svrng_new_mt19937_engine_ex( int num, uint32_t *pseed )

Input Parameters

- **seed**: Initial condition for the engine.
- **num**: Number of initialization values for the extended routine. \( \text{num} \geq 0 \). See VSL Notes for further details on extended initialization of the mt19937 engine.
- **pseed**: Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_mt19937_engine` function allocates memory for the mt19937 engine (from C++ 11 standard) and initializes it using one `seed` value. The extended version of the function, `svrng_new_mt19937_engine_ex`, accepts several values for complex initialization cases. Because the mt19937 engine has 19937 bits of state in memory, its initialization differs from the other engines. See the Notes for Intel® MKL Vector Statistics document for detailed information on this engine.

Introduction

`svrng_delete_engine`

*Deallocates memory for the specified engine*

Syntax

```c
svrng_engine_t svrng_delete_engine( svrng_engine_t engine )
```

Input Parameters

- `engine` Pointer to the engine to be deallocated.

Description

The `svrng_delete_engine` function deallocates memory for the specified engine.

Status flags set

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_ENGINE</code></td>
<td>Bad engine (NULL pointer)</td>

Return Values

NULL pointer.

Distribution Initialization and Finalization

The Short Vector Random Number Generator (SVRNG) library supports the following distributions:

- **uniform** *single and double floating point and 32-bit integer*
- **normal** *single and double floating point*
SVRNG distributions must be initialized before random numbers can be generated. The initialization and finalization routines in this section allocate memory, pre-compute loop-invariant values and broadcast scalar constants for fast vector generation. Update functions are also provided to re-compute these numbers without memory re-allocation. More detail on the "figures of merit" for these distributions can be found in the "Figures of Merit for Random Number Generators" and "Testing of Distribution Random Number Generators" sections of the Notes for Intel® MKL Vector Statistics document referenced in the Introduction.

**See Also**

Introduction

svrng_new_uniform_distribution_[int|float|double]/svrng_update_uniform_distribution_[int|float|double]

 Allocates and initializes constants for the uniform distribution with specified parameters

**Syntax**

svrng_distribution_t svrng_new_uniform_distribution_int( int a, int b )
svrng_distribution_t svrng_new_uniform_distribution_float( float a, float b )
svrng_distribution_t svrng_new_uniform_distribution_double( double a, double b )
svrng_distribution_t svrng_update_uniform_distribution_int( svrng_distribution_t distr, int a, int b )
svrng_distribution_t svrng_update_uniform_distribution_float( svrng_distribution_t distr, float a, float b )
svrng_distribution_t svrng_update_uniform_distribution_double( svrng_distribution_t distr, double a, double b )

**Input Parameters**

- **a**: Left bound of interval
- **b**: Right bound of interval
- **distr**: Pointer to the distribution to be updated

**Description**

The svrng_new_uniform_distribution_[int|float|double] function allocates memory for a uniform distribution and pre-computes and broadcasts loop-invariant constants required for vector generation of uniformly distributed values over the interval \([a, b)\), where \(a, b\) are the real left and right bounds of the interval respectively with \(a < b\). 32-bit int, float and double types are supported. The svrng_update_uniform_distribution_[int|float|double] functions give the same result, but by modifying existing distributions instead of allocating memory for new distributions.

**Return Values**

A pointer to the distribution created or updated by the function, or NULL on error.

### svrng_new_normal_distribution_[float|double]/svrng_update_normal_distribution_[float|double]

Allocates and initializes constants for the normal distribution with specified parameters

#### Syntax

```
svrng_distribution_t svrng_new_normal_distribution_float( float mean, float stddev )
svrng_distribution_t svrng_new_normal_distribution_double( double mean, double stddev )
svrng_distribution_t svrng_update_normal_distribution_float( svrng_distribution_t distr, float mean, float stddev )
svrng_distribution_t svrng_update_normal_distribution_double( svrng_distribution_t distr, double mean, double stddev )
```

#### Input Parameters

- `mean`  
  Mean value of the normal distribution.
- `stddev`  
  Standard deviation of the normal distribution
- `distr`  
  Pointer to the distribution to be updated

#### Description

The `svrng_new_normal_distribution_[float|double]` functions allocate memory for a normal distribution of either 32- or 64-bit floating point numbers with the specified `mean` and positive, real `stddev` using the ICDF method. The function pre-computes and broadcasts loop-invariant constants required for vector generation. The `svrng_update_normal_distribution_[float|double]` functions give the same result, but by modifying existing distributions instead of allocating memory for new distributions.

#### Status flags set

<table>

</tr>
<tr>
<td>SVRNG_STATUS_ERROR_BAD_PARAM</td>
<td>Bad parameter: stddev</td>
</tr>
<tr>
<td>SVRNG_STATUS_ERROR_BAD_DISTR</td>
<td>Bad distribution (NULL pointer)</td>
</tr>
</tbody>
</table>

#### Return Values

A pointer to the distribution created or updated by the function, or NULL on error.
svrng_delete_distribution
Deallocates memory for the specified distribution

Syntax
svrng_distribution_t svrng_delete_distribution( svrng_distribution_t distr)

Input Parameters
distr Pointer to the distribution to be deallocated.

Description
The svrng_delete_distribution function deallocates memory for the specified distribution.

Status flags set

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVRNG_STATUS_ERROR_BAD_DISTR</td>
<td>distr is a NULL pointer.</td>
</tr>
</tbody>
</table>

Return Values
NULL pointer.

Random Values Generation
Once the engines and distributions are created by the appropriate initialization routines, the SVRNG generation functions may be called. Both scalar and vector implementations are available. Scalar functions return random values of native "C" types such as int32_t, uint32_t, uint64_t, float, and double, while vector functions produce packed results in SIMD registers through CPU-specific types (see the "Data Types and Calling Conventions" sections). Calls to scalar SVRNG intrinsics in loops can be vectorized by the compiler via the "vector_variant" feature when the svrng.h header file is used. The compiler vectorizer replaces scalar calls by a corresponding SIMD version.

See Also
Data Types and Calling Conventions

svrng_generate[1|2|4|8|16|32]_[uint|ulong]
Generates uniform random bits over the a specified range

Syntax
uint32_t svrng_generate_uint( svrng_engine_t engine )
srvng_uint1_t svrng_generate1_uint( svrng_engine_t engine )
srvng_uint2_t svrng_generate2_uint( svrng_engine_t engine )
srvng_uint4_t svrng_generate4_uint( svrng_engine_t engine )
srvng_uint8_t svrng_generate8_uint( svrng_engine_t engine )
srvng_uint16_t svrng_generate16_uint( svrng_engine_t engine )
srvng_uint32_t svrng_generate32_uint( svrng_engine_t engine )
uint64_t svrng_generate_ulong( svrng_engine_t engine )
srvng_ulong1_t svrng_generate1_ulong( svrng_engine_t engine )

svrng_ulong2_t svrng_generate2_ulong( svrng_engine_t engine )
svrng_ulong4_t svrng_generate4_ulong( svrng_engine_t engine )
svrng_ulong8_t svrng_generate8_ulong( svrng_engine_t engine )
svrng_ulong16_t svrng_generate16_ulong( svrng_engine_t engine )
svrng_ulong32_t svrng_generate32_ulong( svrng_engine_t engine )

**Input Parameters**

*engine* Pointer to the engine.

**Description**

The `svrng_generate[n]_[uint|ulong]` functions generate uniform random bits over the range [0, MAX) with engine-dependent maximum value. The uint versions are available for 32-bit engines only (rand0, rand, mcg31m1, mt19937), the ulong versions are available for 64-bit engines only (mcg59). The number n if specified expresses the number of packed unsigned integer elements in returned SIMD registers.

**Status flags set**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SVRNG_STATUS_ERROR_UNSUPPORTED</code></td>
<td>Unmatched engine and result type. See the Description section for supported combinations.</td>
</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_ENGINE</code></td>
<td>Bad engine (NULL pointer)</td>
</tr>
</tbody>
</table>

**Return Values**

Unsigned integer random value(s). The `svrng_generate[_uint|ulong]` functions return a single unsigned 32- or 64-bit integer random value. The `svrng_generate[n]_[uint|ulong]` functions, for n=1, 2, 4, 8, 16, or 32 return as many unsigned, 32- or 64-bit integer random values packed in a SIMD register.

**svrng_generate[1|2|4|8|16|32]_[int|float|double]**

Generates distributed random values for the specified engine and distribution.

**Syntax**

```cpp
int32_t svrng_generate_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int1_t svrng_generate1_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int2_t svrng_generate2_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int4_t svrng_generate4_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int8_t svrng_generate8_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int16_t svrng_generate16_int( svrng_engine_t engine, svrng_distribution_t distr )
svrng_int32_t svrng_generate32_int( svrng_engine_t engine, svrng_distribution_t distr )
float svrng_generate_float( svrng_engine_t engine, svrng_distribution_t distr )
svrng_float1_t svrngGenerate1_float( svrng_engine_t engine, svrng_distribution_t distr )
```
The `svrng_generate[n]_[int|float|double]` functions generate distributed random values based on the input engine and distribution specified. The output types that are supported—int, float, or double—depend on the distribution used. The number \( n \) if specified expresses the number of packed elements desired in the returned SIMD registers.

### Status flags set

<table>
<thead>
<tr>
<th>Name</th>

<td>Bad engine (NULL pointer)</td>
</tr>
<tr>
<td><code>SVRNG_STATUS_ERROR_BAD_DISTR</code></td>
<td>Bad distribution (NULL pointer)</td>
</tr>
</tbody>
</table>
Return Values
The svrng_generate_[int|long|double] functions return a single random value of the specified type. The svrng_generate[n]_[int|long|double] functions, for n=1, 2, 4, 8, 16, or 32, return as many signed random values packed in a SIMD register.

Service Routines
There are two types of service routines available to support the short vector random number generator library:
1. Functions for parallel computations
2. Error handling functions

Parallel Computation Support
One of the basic requirements for the random number sequences generated by the engines is their mutual independence and lack of inter-correlation. Even if you want random number samplings to be correlated, such correlation should be controllable. The Short Vector Random Number Generator (SVRNG) library provides two techniques: "skip-ahead" and "leap-frog".

Skip-ahead
The skip-ahead method splits the original sequence into k non-overlapping blocks, where k is the number of independent sequences. Each of the sequences generates random numbers only from the corresponding block of contiguous random numbers.

Leap-frog
The leap-frog method splits the original sequence into k disjoint subsequences in such a way that the first stream would generate the random numbers $x_1, x_{k+1}, x_{2k+1}, x_{3k+1}, \ldots$, the second stream would generate the random numbers $x_2, x_k + 2, x_{2k+2}, x_{3k+2}, \ldots$, and, finally, the $k$-th stream would generate the random numbers $x_k, x_{2k}, x_{3k}, \ldots$. The multi-dimensional uniformity properties of each subsequence deteriorate seriously as $k$ grows so this method is only useful if $k$ is less than about 25.
The following sequence outlines the typical usage model for creating independent sequences of random numbers in a parallel computation environment:

- Create the original engine
- Create a copy of the original engine in each thread
- Apply one of techniques above to re-initialize the individual engines to provide an independent sequence on each thread

For detailed information on the use of SVRNG intrinsics in a parallel computation environment see the "Random Streams and RNGs in Parallel Computation" section of the Notes for Intel® MKL Vector Statistic document listed in the introduction.

---

Note: Currently skip-ahead and leap-frog methods are supported by the rand0, rand, mcg31m1, and mcg59 engines. The skip-ahead and leap-frog methods of splitting a stream are not yet implemented for the mt19937 engine, but mt19937 naturally provides parallel support during initialization. See the MT19937 section of the Notes for Intel® MKL Vector Statistic document listed in the introduction.

Introduction

svrng_copy_engine

Allocates memory for a new engine and copies over all parameters.

Syntax

```
svrng_engine_t svrng_copy_engine( svrng_engine_t orig_engine )
```

Input Parameters

- `orig_engine` Pointer to the engine to be copied

Description

The `svrng_copy_engine` function allocates memory for a new engine then copies all parameters from original engine to the new engine.

Status flags set

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SVRNG_STATUS_ERROR_MEMORYALLOC</code></td>
<td>Memory allocation failure</td>
</tr>
</tbody>
</table>
### SVRNG_STATUS_ERROR_BAD_ENGINE

- **Description**: Bad engine (NULL pointer)

### Return Values

Pointer to the newly created copy of the original engine, or NULL on error.

### svrng_skipahead_engine

*Re-initialize engine parameters for use of the skip-ahead method*

#### Syntax

```c
svrng_engine_t svrng_skipahead_engine( svrng_engine_t orig_engine, long long nskip )
```

#### Input Parameters

- **orig_engine**: Pointer to the engine to be re-initialized using the skip-ahead technique
- **nskip**: Number of skipped elements

#### Description

Re-initializes engine parameters using the block-splitting ("skip-ahead") method. The function skips a given number of elements in a random stream. This feature is particularly useful in distributing random numbers from original random stream across different computational nodes. If the largest number of random numbers used by a computational node is `nskip`, then the original random sequence may be split by this function into non-overlapping blocks of `nskip` size so that each block corresponds to the respective computational node. The number of computational nodes is unlimited.

### Status flags set

<td>Memory allocation procedure failure</td>
</tr>
<tr>
<td>SVRNG_STATUS_ERROR_BAD_PARAM2</td>
<td>Bad parameter: <code>nskip</code></td>
</tr>
</tbody>
</table>

### Return Values

Pointer to the same input engine or NULL on error.

### svrng_leapfrog_engine

*Re-initialize engine parameters for use of the leap-frog method*

#### Syntax

```c
svrng_engine_t svrng_leapfrog_engine( svrng_engine_t orig_engine, int k, int nstreams )
```

#### Input Parameters

- **orig_engine**: Pointer to the engine to be re-initialized using the leap-frog technique.
**Description**

The `svrng_skipahead_engine` function re-initializes the engine parameters using the leap-frog method. The leap-frogged engine generates random numbers in a random stream with non-unit stride. This feature is particularly useful in distributing random numbers from the original stream across the `nstreams` buffers without generating the original random sequence with subsequent manual distribution.

Macro Name | Description
---|---
SVRNG\_STATUS\_ERROR\_MEMORY\_ALLOC | Memory allocation failure
SVRNG\_STATUS\_ERROR\_UNSUPPORTED | Function or method not supported

svrng\_set\_status
Sets the status variable to a specified value and returns the previous status value

Syntax
int32\_t svrng\_set\_status( int32\_t new\_status )

Input Parameters
new\_status
The new status.

Description
The svrng\_set\_status function sets the status variable to a specific constant value and returns the previous status value. See the Error Handling page for a table of values defined in svrng\_h.

Return Values
Returns the previous status value.

svrng\_get\_status
Returns the current status value

Syntax
int32\_t svrng\_get\_status()

Description
The svrng\_get\_status function returns the current status value.

Return Values
The current status value.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4VNNIW Instructions

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4VNNIW instruction intrinsics are located in the zmmintrin\_h header file.

To use these intrinsics, include the immintrin\_h file as follows:

```c
#include <immintrin.h>
```

_-mm512\_4dpwssd\_epi32

```c
_mm512i _mm512_4dpwssd_epi32 ( _m512 c, _m512 a0, _m512 a1, _m512 a2, _m512 a3, _m128 * b)
```

<table>

**Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Additional Instructions**

**Additional Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions**

The additional instructions documented in this section enrich the operations available as part of Intel® AVX-512 Foundation instructions. A large portion of these instructions can be divided into two groups: Byte and Word Instructions, and Doubleword and Quadword Instructions. The group of byte and word (8 and 16-bit) operations, indicated by the AVX512BW and AVX512VBMI CPUID flags, enhance small integer operations. The group of doubleword and quadword (32 and 64-bit) operations indicated by the AVX512DQ and AVX512IFMA52 CPUID flags, enhance integer and floating-point operations.

An additional orthogonal capability known as Vector Length Extensions provide for most AVX-512 instructions to operate on 128 or 256 bits, instead of only 512. Vector Length Extensions can currently be applied to most Foundation Instructions, the Conflict Detection Instructions as well as the new byte, word, doubleword and quadword instructions. These AVX-512 Vector Length Extensions are indicated by the AVX512VL CPUID flag. The use of Vector Length Extensions extends most AVX-512 operations to also operate on XMM (128-bit, SSE) registers and YMM (256-bit, AVX) registers. The use of Vector Length Extensions allows the capabilities of EVEX encodings, including the use of mask registers and access to registers 16..31, to be applied to XMM and YMM registers instead of only to ZMM registers.

**Byte and Word Instructions**

The byte and word instructions, indicated by the AVX512BW CPUID flag, extend write-masking and zero-masking to support smaller element sizes. The original AVX-512 Foundation instructions supported such masking with vector element sizes of 32 or 64 bits. As a 512-bit vector register could hold at most 16 32-bit elements, a write-mask size of 16 bits was sufficient.

With an instruction indicated by an AVX512BW CPUID flag, a 512-bit vector can hold 64 8-bit elements or 32 16-bit elements, so write masks must be able to hold 64 bits. To support this, two new mask types, `__mmask32` and `__mmask64` have been introduced, along with additional maskable intrinsics that operate on vectors of 8 and 16-bit elements. For example,

```c
__m512i _mm512_mask_abs_epi8(__m512i src, __mmask64 k, __m512i a);
```

will compute the absolute value of 8-bit elements in `a` corresponding to the set bits of write mask `k`. Elements corresponding to a zero bit in `k` are blended in from `src`.

**Doubleword and Quadword Instructions**

The doubleword and quadword instructions, indicated by the AVX512DQ CPUID flag, consist of additional instructions along the lines of the Foundation instructions indicated by the AVX512F CPUID flag in that they operate on 512-bit vectors whose elements are 16 32-bit elements or 8 64-bit elements. Some of these instructions provide new functionality such as the conversion of floating point numbers to 64-bit integers. Other instructions promote existing instructions (e.g., vxorps) to use 512-bit registers.

**Vector Length Extensions**

The vector length extensions indicated by CPUID flag AVX512VL add write-masking, zero-masking, and embedded broadcast features to 128- and 256-bit vector lengths. So for example,

```c
__m256 _mm256_maskz_add_ps(_mmask8 k, __m256 a, __m256 b);
```
will add corresponding float32 elements of \( a \) and \( b \) where the mask bit from \( k \) is set, and will produce zero in the elements where the bit from \( k \) is clear.

**Intrinsics for Arithmetic Operations**

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.  
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>

```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vfmsubadd132pd, vfmsubadd213pd, vfmsubadd231pd
Multiply packed double-precision (64-bit) floating-point elements in $a$ and $b$, alternatively subtract and add packed elements in $c$ from/to the intermediate result, and return the results using writemask $k$ (elements are copied from $a$ when the corresponding mask bit is not set).

```c
__m256d __mm256_mask3_fmsubadd_pd(__m256d a, __m256d b, __m256d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vfmsubadd132pd, vfmsubadd213pd, vfmsubadd231pd
Multiply packed double-precision (64-bit) floating-point elements in $a$ and $b$, alternatively subtract and add packed elements in $c$ from/to the intermediate result, and return the results using writemask $k$ (elements are copied from $c$ when the corresponding mask bit is not set).

```c
__m256d __mm256_maskz_fmsubadd_pd(__mmask8 k, __m256d a, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vfmsubadd132pd, vfmsubadd213pd, vfmsubadd231pd
Multiply packed double-precision (64-bit) floating-point elements in $a$ and $b$, alternatively subtract and add packed elements in $c$ from/to the intermediate result, and return the results using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).
Multiply packed double-precision (64-bit) floating-point elements in \(a\) and \(b\), alternatively subtract and add packed elements in \(c\) from/to the intermediate result, and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vminps
Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and store packed minimum values in the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{\_mm\_maskz\_min\_ps}
\]

\[
\text{\_m128}\ \text{\_mm\_maskz\_min\_ps(\_mmask8 \ k, \_m128\ a, \_m128\ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vminps
Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and store packed minimum values in the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\_mm\_mask\_min\_ps}
\]

\[
\text{\_m256}\ \text{\_mm\_mask\_min\_ps(\_m256\ src, \_mmask8 \ k, \_m256\ a, \_m256\ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vminps
Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and store packed minimum values in the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{\_mm\_maskz\_min\_ps}
\]

\[
\text{\_m256}\ \text{\_mm\_maskz\_min\_ps(\_mmask8 \ k, \_m256\ a, \_m256\ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vminps
Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and store packed minimum values in the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\_mm\_mask\_mul\_pd}
\]

\[
\text{\_m128d}\ \text{\_mm\_mask\_mul\_pd(\_m128d\ src, \_mmask8 \ k, \_m128d\ a, \_m128d\ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulpd
Multiply packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). RM.

\[
\text{\_mm\_maskz\_mul\_pd}
\]

\[
\text{\_m128d}\ \text{\_mm\_maskz\_mul\_pd(\_mmask8 \ k, \_m128d\ a, \_m128d\ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulpd
Multiply packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\texttt{\_mm256\_mask\_mul\_pd}}
\]
\[
\text{\_m256d \_mm256\_mask\_mul\_pd(\_m256d \text{src}, \_mmask8 \text{k}, \_m256d \text{a}, \_m256d \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[
\text{\texttt{\_mm256\_maskz\_mul\_pd}}
\]
\[
\text{\_m256d \_mm256\_maskz\_mul\_pd(\_mmask8 \text{k}, \_m256d \text{a}, \_m256d \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\texttt{\_mm\_mask\_mul\_ps}}
\]
\[
\text{\_m128 \_mm\_mask\_mul\_ps(\_m128 \text{src}, \_mmask8 \text{k}, \_m128 \text{a}, \_m128 \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set). RM.

\[
\text{\texttt{\_mm\_maskz\_mul\_ps}}
\]
\[
\text{\_m128 \_mm\_maskz\_mul\_ps(\_mmask8 \text{k}, \_m128 \text{a}, \_m128 \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set). RM.

\[
\text{\texttt{\_mm256\_mask\_mul\_ps}}
\]
\[
\text{\_m256 \_mm256\_mask\_mul\_ps(\_m256 \text{src}, \_mmask8 \text{k}, \_m256 \text{a}, \_m256 \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set). RM.

\[
\text{\texttt{\_mm256\_maskz\_mul\_ps}}
\]
\[
\text{\_m256 \_mm256\_maskz\_mul\_ps(\_mmask8 \text{k}, \_m256 \text{a}, \_m256 \text{b})}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): `vmulps`

Multiply packed single-precision (32-bit) floating-point elements in `a` and `b`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```
_mm_mask_rcp14_pd
__m128d _mm_mask_rcp14_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vrcp14pd`

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

```
_mm_maskz_rcp14_pd
__m128d _mm_maskz_rcp14_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vrcp14pd`

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

```
_mm_rcp14_pd
__m128d _mm_rcp14_pd(__m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vrcp14pd`

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in `a`, and return the results. The maximum relative error for this approximation is less than $2^{-14}$.

```
_mm256_mask_rcp14_pd
__m256d _mm256_mask_rcp14_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vrcp14pd`

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

```
_mm256_maskz_rcp14_pd
__m256d _mm256_maskz_rcp14_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vrcp14pd`

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.
_mm256_rcp14_pd

__m256d _mm256_rcp14_pd(__m256d a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in \( a \), and return the results. The maximum relative error for this approximation is less than \( 2^{-14} \).

_mm_mask_rcp14_ps

__m128 _mm_mask_rcp14_ps(__m128 src, __mmask8 k, __m128 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). The maximum relative error for this approximation is less than \( 2^{-14} \).

_mm_maskz_rcp14_ps

__m128 _mm_maskz_rcp14_ps(__mmask8 k, __m128 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in \( a \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than \( 2^{-14} \).

_mm_rcp14_ps

__m128 _mm_rcp14_ps(__m128 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in \( a \), and return the results. The maximum relative error for this approximation is less than \( 2^{-14} \).

_mm256_mask_rcp14_ps

__m256 _mm256_mask_rcp14_ps(__m256 src, __mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). The maximum relative error for this approximation is less than \( 2^{-14} \).

_mm256_maskz_rcp14_ps

__m256 _mm256_maskz_rcp14_ps(__mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrcp14ps
Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrsqrt14ps

Compute the approximate reciprocal square root of packed single-precision (32-bit) floating-point elements in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

_mm256_maskz_rsqrt14_ps

__m256 _mm256_maskz_rsqrt14_ps(__mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrsqrt14ps

Compute the approximate reciprocal square root of packed single-precision (32-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than $2^{-14}$.

_mm_mask_sqrt_pd

__m128d _mm_mask_sqrt_pd(__m128d src, __mmask8 k, __m128d a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsqrtpd

Compute the square root of packed double-precision (64-bit) floating-point elements in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_sqrt_pd

__m128d _mm_maskz_sqrt_pd(__mmask8 k, __m128d a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsqrtpd
Compute the square root of packed double-precision (64-bit) floating-point elements in `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
_mm256_mask_sqrt_pd
__m256d _mm256_mask_sqrt_pd(__m256d src, __mmask8 k, __m256d a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtpd
Compute the square root of packed double-precision (64-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
_mm256_maskz_sqrt_pd
__m256d _mm256_maskz_sqrt_pd(__mmask8 k, __m256d a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps
Compute the square root of packed single-precision (32-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
_mm_mask_sqrt_ps
__m128 _mm_mask_sqrt_ps(__m128 src, __mmask8 k, __m128 a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps
Compute the square root of packed single-precision (32-bit) floating-point elements in `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
_mm_maskz_sqrt_ps
__m128 _mm_maskz_sqrt_ps(__mmask8 k, __m128 a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps
Compute the square root of packed single-precision (32-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
_mm256_mask_sqrt_ps
__m256 _mm256_mask_sqrt_ps(__m256 src, __mmask8 k, __m256 a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps
Compute the square root of packed single-precision (32-bit) floating-point elements in `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
_mm256_maskz_sqrt_ps
__m256 _mm256_maskz_sqrt_ps(__mmask8 k, __m256 a)
```
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsqrtps

Compute the square root of packed single-precision (32-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__m128d_mm_mask_sub_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in b from packed double-precision (64-bit) floating-point elements in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
__m128d_mm_maskz_sub_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in b from packed double-precision (64-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__m256d_mm256_mask_sub_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in b from packed double-precision (64-bit) floating-point elements in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
__m256d_mm256_maskz_sub_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in b from packed double-precision (64-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__m256d_mm256_maskz_sub_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubps

Subtract packed double-precision (64-bit) floating-point elements in b from packed double-precision (64-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).
Subtract packed single-precision (32-bit) floating-point elements in \( b \) from packed single-precision (32-bit) floating-point elements in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \text{_mm_maskz_sub_ps} \]

\[
\text{m}128 \text{ } \text{mm_maskz_sub_ps}(\text{mmask8 } k, \text{m}128 \text{ } a, \text{m}128 \text{ } b)
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in \( b \) from packed single-precision (32-bit) floating-point elements in \( a \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[ \text{_mm256_mask_sub_ps} \]

\[
\text{m}256 \text{ } \text{mm256_mask_sub_ps}(\text{m}256 \text{ } src, \text{mmask8 } k, \text{m}256 \text{ } a, \text{m}256 \text{ } b)
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in \( b \) from packed single-precision (32-bit) floating-point elements in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \text{_mm256_maskz_sub_ps} \]

\[

Compute the absolute value of packed 8-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_abs_epi8

__m256i _mm256_maskz_abs_epi8(__mmask32 k, __m256i a)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpabs

Compute the absolute value of packed 8-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512_abs_epi8

__m512i _mm512_abs_epi8(__m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabs

Compute the absolute value of packed 8-bit integers in a, and store the unsigned results in the return value.

_mm512_mask_abs_epi8

__m512i _mm512_mask_abs_epi8(__m512i src, __mmask64 k, __m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabs

Compute the absolute value of packed 8-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm512_maskz_abs_epi8

__m512i _mm512_maskz_abs_epi8(__mmask64 k, __m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabs

Compute the absolute value of packed 8-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_abs_epi32

__m128i _mm_mask_abs_epi32(__m128i src, __mmask8 k, __m128i a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabs

Compute the absolute value of packed 32-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).
\_mm\_maskz\_abs\_epi32
\_m128i \_mm\_maskz\_abs\_epi32(\_mmask8 k, \_m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsd
Compute the absolute value of packed 32-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

\_mm256\_mask\_abs\_epi32
\_m256i \_mm256\_mask\_abs\_epi32(\_m256i src, \_mmask8 k, \_m256i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsd
Compute the absolute value of packed 32-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

\_mm256\_maskz\_abs\_epi32
\_m256i \_mm256\_maskz\_abs\_epi32(\_mmask8 k, \_m256i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsd
Compute the absolute value of packed 32-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

\_mm\_abs\_epi64
\_m128i \_mm\_abs\_epi64(\_m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value.

\_mm\_mask\_abs\_epi64
\_m128i \_mm\_mask\_abs\_epi64(\_m128i src, \_mmask8 k, \_m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

\_mm\_maskz\_abs\_epi64
\_m128i \_mm\_maskz\_abs\_epi64(\_mmask8 k, \_m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).
_mm256_abs_epi64

__m256i _mm256_abs_epi64(__m256i a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value.

__m256i _mm256_abs_epi64(__m256i src, __mmask8 k, __m256i a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

__m256_maskz_abs_epi64

__m256i _mm256_maskz_abs_epi64(__mmask8 k, __m256i a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpabsq
Compute the absolute value of packed 64-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__m128i _mm_mask_abs_epi16(__m128i src, __mmask8 k, __m128i a)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpabsw
Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

__m128i _mm_maskz_abs_epi16(__mmask8 k, __m128i a)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpabsw
Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__m256i _mm256_mask_abs_epi16(__m256i src, __mmask16 k, __m256i a)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpabsw
Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).
_mm256_maskz_abs_epi16

__m256i _mm256_maskz_abs_epi16(__mmask16 k, __m256i a)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512_abs_epi16

__m512i _mm512_abs_epi16(__m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value.

_mm512_mask_abs_epi16

__m512i _mm512_mask_abs_epi16(__m512i src, __mmask32 k, __m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm512_maskz_abs_epi16

__m512i _mm512_maskz_abs_epi16(__mmask32 k, __m512i a)

CPUID Flags: AVX512BW
Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in a, and store the unsigned results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_epi8

__m128i _mm_mask_add_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpaddb

Add packed 8-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_add_epi8

__m128i _mm_maskz_add_epi8(__mmask16 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpaddb
Add packed 8-bit integers in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_mm256_mask_add_epi8
\]

\[

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```cpp
_mm256_mask_add_epi16
__m256i _mm256_mask_add_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```cpp
_mm256_maskz_add_epi16
__m256i _mm256_maskz_add_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```cpp
_mm512_add_epi16
__m512i _mm512_add_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results.

```cpp
_mm512_mask_add_epi16
__m512i _mm512_mask_add_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```cpp
_mm512_maskz_add_epi16
__m512i _mm512_maskz_add_epi16(__mmask32 k, __m512i a, __m512i b)
```
CPUID Flags: AVX512BW
Instruction(s): vpaddw
Add packed 16-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
_mm_mask_avg_epu8

__m128i _mm_mask_avg_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpavgb
Average packed unsigned 8-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
_mm_maskz_avg_epu8

__m128i _mm_maskz_avg_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpavgb
Average packed unsigned 8-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
_mm256_mask_avg_epu8

__m256i _mm256_mask_avg_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpavgb
Average packed unsigned 8-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
_mm256_maskz_avg_epu8

__m256i _mm256_maskz_avg_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpavgb
Average packed unsigned 8-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
_mm512_avg_epu8

__m512i _mm512_avg_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW
Instruction(s): vpavgb
Average packed unsigned 8-bit integers in a and b, and return the results.

```c
_mm512_mask_avg_epu8

__m512i _mm512_mask_avg_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```
CPUID Flags: AVX512BW

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_mm512_maskz_avg_epu8
\]

\[
_m512i \_mm512\_maskz\_avg\_epu8(\_mmask64 \_k, \_m512i \_a, \_m512i \_b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_mm\_mask\_avg\_epu16
\]

\[
_ml28i \_mm\_mask\_avg\_epu16(\_ml28i \_src, \_mmask8 \_k, \_ml28i \_a, \_ml28i \_b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_mm\_maskz\_avg\_epu16
\]

\[
_ml28i \_mm\_maskz\_avg\_epu16(\_mmask8 \_k, \_ml28i \_a, \_ml28i \_b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_mm256\_mask\_avg\_epu16
\]

\[
_ml256i \_mm256\_mask\_avg\_epu16(\_ml256i \_src, \_mmask16 \_k, \_ml256i \_a, \_ml256i \_b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_mm256\_maskz\_avg\_epu16
\]

\[
_ml256i \_mm256\_maskz\_avg\_epu16(\_mmask16 \_k, \_ml256i \_a, \_ml256i \_b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).
__mm512_avg_epi16

__m512i __mm512_avg_epi16(__m512i a, __m512i b)

CPUID Flags: AVX512BW
Instruction(s): vpavgw

Average packed unsigned 16-bit integers in a and b, and return the results.

__mm512_mask_avg_epi16

__m512i __mm512_mask_avg_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)

CPUID Flags: AVX512BW
Instruction(s): vpavgw

Average packed unsigned 16-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm512_maskz_avg_epi16

__m512i __mm512_maskz_avg_epi16(__mmask32 k, __m512i a, __m512i b)

CPUID Flags: AVX512BW
Instruction(s): vpavgw

Average packed unsigned 16-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm_mask_maddubs_epi16

__m128i __mm_mask_maddubs_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in a by packed signed 8-bit integers in b, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm_maskz_maddubs_epi16

__m128i __mm_maskz_maddubs_epi16(__mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in a by packed signed 8-bit integers in b, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm256_mask_maddubs_epi16

__m256i __mm256_mask_maddubs_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in a by packed signed 8-bit integers in b, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).
Multiply packed unsigned 8-bit integers in \(a\) by packed signed 8-bit integers in \(b\), producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\text{\_mm256\_maskz\_maddubs\_epi16}
\]

\[
\text{\_m256i \_mm256\_maskz\_maddubs\_epi16(\_mmask16 k, \_m256i a, \_m256i b)}
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in \(a\) by packed signed 8-bit integers in \(b\), producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\_mm512\_maddubs\_epi16}
\]

\[
\text{\_m512i \_mm512\_maddubs\_epi16(\_m512i a, \_m512i b)}
\]

CPUID Flags: AVX512BW

Instruction(s): vpmaddubsw

Vertically multiply each unsigned 8-bit integer from \(a\) with the corresponding signed 8-bit integer from \(b\), producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value.

\[
\text{\_mm512\_mask\_maddubs\_epi16}
\]

\[
\text{\_m512i \_mm512\_mask\_maddubs\_epi16(\_m512i src, \_mmask32 k, \_m512i a, \_m512i b)}
\]

CPUID Flags: AVX512BW

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in \(a\) by packed signed 8-bit integers in \(b\), producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\text{\_mm512\_maskz\_maddubs\_epi16}
\]

\[
\text{\_m512i \_mm512\_maskz\_maddubs\_epi16(\_mmask32 k, \_m512i a, \_m512i b)}

\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in \( a \) and \( b \), producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_mm512\_madd\_epi16
\]

\[
_m512i\_mm512\_madd\_epi16(_m512i\ a, _m512i\ b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in \( a \) and \( b \), producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value.

\[
_mm512\_mask\_madd\_epi16
\]

\[
_m512i\_mm512\_mask\_madd\_epi16(_m512i\ src, _mmask16\ k, _m512i\ a, _m512i\ b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in \( a \) and \( b \), producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).
_mm512_maskz_madd_epi16

__m512i _mm512_maskz_madd_epi16(__mmask16 k, __m512i a, __m512i b)

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in a and b, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_epi8

__m128i _mm_mask_max_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in a and b, and store packed maximum values in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_max_epi8

__m128i _mm_maskz_max_epi8(__mmask16 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in a and b, and store packed maximum values in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epi8

__m256i _mm256_mask_max_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in a and b, and store packed maximum values in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_max_epi8

__m256i _mm256_maskz_max_epi8(__mmask32 k, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in a and b, and store packed maximum values in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): \text{vpmmaxsd}
Compare packed 32-bit integers in $a$ and $b$, and store packed maximum values in the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm_mask_max_epi64
__m128i __mm_mask_max_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq

Compare packed 64-bit integers in $a$ and $b$, and store packed maximum values in the return value using writemask $k$ (elements are copied from src when the corresponding mask bit is not set).

```c
__mm_maskz_max_epi64
__m128i __mm_maskz_max_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq

Compare packed 64-bit integers in $a$ and $b$, and store packed maximum values in the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm_max_epi64
__m128i __mm_max_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq

Compare packed 64-bit integers in $a$ and $b$, and store packed maximum values in the return value.

```c
__mm256_mask_max_epi64
__m256i __mm256_mask_max_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq

Compare packed 64-bit integers in $a$ and $b$, and store packed maximum values in the return value using writemask $k$ (elements are copied from src when the corresponding mask bit is not set).

```c
__mm256_maskz_max_epi64
__m256i __mm256_maskz_max_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq

Compare packed 64-bit integers in $a$ and $b$, and store packed maximum values in the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm256_max_epi64
__m256i __mm256_max_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxsq
Compare packed 64-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value.

\texttt{\_mm\_mask\_max\_epi16}

\texttt{\_m128i \_mm\_mask\_max\_epi16(\_m128i src, __mmask8 k, __m128i a, __m128i b)}

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): \texttt{vpmaxsw}

Compare packed 16-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value using writemask \textit{k} (elements are copied from \textit{src} when the corresponding mask bit is not set).

\texttt{\_mm\_maskz\_max\_epi16}

\texttt{\_m128i \_mm\_maskz\_max\_epi16(\_mmask8 k, __m128i a, __m128i b)}

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): \texttt{vpmaxsw}

Compare packed 16-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value using zeromask \textit{k} (elements are zeroed out when the corresponding mask bit is not set).

\texttt{\_mm256\_mask\_max\_epi16}

\texttt{\_m256i \_mm256\_mask\_max\_epi16(\_m256i src, \_mmask16 k, __m256i a, __m256i b)}

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): \texttt{vpmaxsw}

Compare packed 16-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value using writemask \textit{k} (elements are copied from \textit{src} when the corresponding mask bit is not set).

\texttt{\_mm256\_maskz\_max\_epi16}

\texttt{\_m256i \_mm256\_maskz\_max\_epi16(\_mmask16 k, __m256i a, __m256i b)}

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): \texttt{vpmaxsw}

Compare packed 16-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value using zeromask \textit{k} (elements are zeroed out when the corresponding mask bit is not set).

\texttt{\_mm512\_mask\_max\_epi16}

\texttt{\_m512i \_mm512\_mask\_max\_epi16(\_m512i src, __mmask32 k, __m512i a, __m512i b)}

CPUID Flags: AVX512BW

Instruction(s): \texttt{vpmaxsw}

Compare packed 16-bit integers in \textit{a} and \textit{b}, and store packed maximum values in the return value using writemask \textit{k} (elements are copied from \textit{src} when the corresponding mask bit is not set).

\texttt{\_mm512\_maskz\_max\_epi16}

\texttt{\_m512i \_mm512\_maskz\_max\_epi16(\_mmask32 k, __m512i a, __m512i b)}

CPUID Flags: AVX512BW

Instruction(s): \texttt{vpmaxsw}
Compare packed 16-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm512}}_{\text{max}}_{\text{epi16}}
\]

\[
_{\text{m512i}}_{\text{mm512}}_{\text{max}}_{\text{epi16}}(_{\text{m512i}}a, _{\text{m512i}}b)
\]

CPUID Flags: AVX512BW
Instruction(s): vpmaxsw

Compare packed 16-bit integers in \(a\) and \(b\), and store packed maximum values in the return value.

\[
_{\text{mm}}_{\text{mask}}_{\text{max}}_{\text{epu8}}
\]

\[
_{\text{m128i}}_{\text{mm}}_{\text{mask}}_{\text{max}}_{\text{epu8}}(_{\text{m128i}}src, _{\text{mmask16}}k, _{\text{m128i}}a, _{\text{m128i}}b)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmxub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm}}_{\text{maskz}}_{\text{max}}_{\text{epu8}}
\]

\[
_{\text{m128i}}_{\text{mm}}_{\text{maskz}}_{\text{max}}_{\text{epu8}}(_{\text{mmask16}}k, _{\text{m128i}}a, _{\text{m128i}}b)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmxub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256}}_{\text{mask}}_{\text{max}}_{\text{epu8}}
\]

\[
_{\text{m256i}}_{\text{mm256}}_{\text{mask}}_{\text{max}}_{\text{epu8}}(_{\text{m256i}}src, _{\text{mmask32}}k, _{\text{m256i}}a, _{\text{m256i}}b)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmxub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm256}}_{\text{maskz}}_{\text{max}}_{\text{epu8}}
\]

\[
_{\text{m256i}}_{\text{mm256}}_{\text{maskz}}_{\text{max}}_{\text{epu8}}(_{\text{mmask32}}k, _{\text{m256i}}a, _{\text{m256i}}b)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmxub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm512}}_{\text{mask}}_{\text{max}}_{\text{epu8}}
\]

\[
_{\text{m512i}}_{\text{mm512}}_{\text{mask}}_{\text{max}}_{\text{epu8}}(_{\text{m512i}}src, _{\text{mmask64}}k, _{\text{m512i}}a, _{\text{m512i}}b)
\]

CPUID Flags: AVX512BW
Instruction(s): vpmxub
Compare packed unsigned 8-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{_mm512_maskz_max_epu8}

_{\text{m128i}} \_\text{mm}_{\text{mask}}_{\max}_{\text{epu64}}(_{\text{m128i}} \text{src}, _{\text{mmask8}} k, _{\text{m128i}} a, _{\text{m128i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[\_\text{mm}_{\text{maskz}}_{\max}_{\text{epu64}}\]
\[
_{\text{m128i}} \_\text{mm}_{\text{maskz}}_{\max}_{\text{epu64}}(_{\text{mmask8}} k, _{\text{m128i}} a, _{\text{m128i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\), and store packed maximum values in the return value.

\[\_\text{mm}_{\max}_{\text{epu64}}\]
\[
_{\text{m128i}} \_\text{mm}_{\max}_{\text{epu64}}(_{\text{m128i}} a, _{\text{m128i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[\_\text{mm}_{\text{256}}_{\text{mask}}_{\max}_{\text{epu64}}\]
\[
_{\text{m256i}} \_\text{mm}_{\text{256}}_{\text{mask}}_{\max}_{\text{epu64}}(_{\text{m256i}} \text{src}, _{\text{mmask8}} k, _{\text{m256i}} a, _{\text{m256i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\), and store packed maximum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[\_\text{mm}_{\text{256}}_{\text{maskz}}_{\max}_{\text{epu64}}\]
\[
_{\text{m256i}} \_\text{mm}_{\text{256}}_{\text{maskz}}_{\max}_{\text{epu64}}(_{\text{mmask8}} k, _{\text{m256i}} a, _{\text{m256i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\), and store packed maximum values in the return value.

\[\_\text{mm}_{\text{256}}_{\max}_{\text{epu64}}\]
\[
_{\text{m256i}} \_\text{mm}_{\text{256}}_{\max}_{\text{epu64}}(_{\text{m256i}} a, _{\text{m256i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmaxuq
Compare packed unsigned 64-bit integers in \( a \) and \( b \), and store packed maximum values in the return value.

\[ \_mm\_mask\_max\_epu16 \]
\[ \_m128i \_mm\_mask\_max\_epu16(\_m128i \text{src}, \_mm\_mask8 \text{k}, \_m128i \text{a}, \_m128i \text{b}) \]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaxu

Compare packed unsigned 16-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[ \_mm\_maskz\_max\_epu16 \]
\[ \_m128i \_mm\_maskz\_max\_epu16(\_mm\_mask8 \text{k}, \_m128i \text{a}, \_m128i \text{b}) \]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaxu

Compare packed unsigned 16-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[ \_mm256\_mask\_max\_epu16 \]
\[ \_m256i \_mm256\_mask\_max\_epu16(\_m256i \text{src}, \_mm\_mask16 \text{k}, \_m256i \text{a}, \_m256i \text{b}) \]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaxu

Compare packed unsigned 16-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[ \_mm256\_maskz\_max\_epu16 \]
\[ \_m256i \_mm256\_maskz\_max\_epu16(\_mm\_mask16 \text{k}, \_m256i \text{a}, \_m256i \text{b}) \]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmaxu

Compare packed unsigned 16-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[ \_mm512\_mask\_max\_epu16 \]
\[ \_m512i \_mm512\_mask\_max\_epu16(\_m512i \text{src}, \_mm\_mask32 \text{k}, \_m512i \text{a}, \_m512i \text{b}) \]

CPUID Flags: AVX512BW
Instruction(s): vpmaxu

Compare packed unsigned 16-bit integers in \( a \) and \( b \), and store packed maximum values in the return value using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[ \_mm512\_maskz\_max\_epu16 \]
\[ \_m512i \_mm512\_maskz\_max\_epu16(\_mm\_mask32 \text{k}, \_m512i \text{a}, \_m512i \text{b}) \]

CPUID Flags: AVX512BW
Instruction(s): vpmaxu
Compare packed unsigned 16-bit integers in a and b, and store packed maximum values in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm512_max_epu16
__m512i _mm512_max_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW
Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in a and b, and store packed maximum values in the return value.

```c
__mm_mask_min_epi8
__m128i _mm_mask_min_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpminsb

Compare packed 8-bit integers in a and b, and store packed minimum values in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
__mm_maskz_min_epi8
__m128i _mm_maskz_min_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpminsb

Compare packed 8-bit integers in a and b, and store packed minimum values in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm256_mask_min_epi8
__m256i _mm256_mask_min_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpminsb

Compare packed 8-bit integers in a and b, and store packed minimum values in the return value using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
__mm256_maskz_min_epi8
__m256i _mm256_maskz_min_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpminsb

Compare packed 8-bit integers in a and b, and store packed minimum values in the return value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm512_mask_min_epi8
__m512i _mm512_mask_min_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW
Instruction(s): vpminsb
Compare packed 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm512}}_{\text{maskz min}}_{\text{epi8}}
\]

\[
_{\text{m512i}} _{\text{mm512}}_{\text{maskz min}}_{\text{epi8}}(_{\text{mmask64}} k, _{\text{m512i}} a, _{\text{m512i}} b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpminsb

Compare packed 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm512}}_{\text{min}}_{\text{epi8}}
\]

\[
_{\text{m512i}} _{\text{mm512}}_{\text{min}}_{\text{epi8}}(_{\text{m512i}} a, _{\text{m512i}} b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpminsb

Compare packed 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value.

\[
_{\text{mm}}_{\text{mask min}}_{\text{epi32}}
\]

\[
_{\text{m128i}} _{\text{mm}}_{\text{mask min}}_{\text{epi32}}(_{\text{m128i}} src, _{\text{mmask8}} k, _{\text{m128i}} a, _{\text{m128i}} b)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsd

Compare packed 32-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm}}_{\text{maskz min}}_{\text{epi32}}

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[\text{\_mm\_maskz\_min\_epu8}\]
\[\_m128i \text{\_mm\_maskz\_min\_epu8}(\_mmask16 k, \_m128i a, \_m128i b)\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[\text{\_mm256\_mask\_min\_epu8}\]
\[\_m256i \text{\_mm256\_mask\_min\_epu8}(\_m256i src, \_mmask32 k, \_m256i a, \_m256i b)\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[\text{\_mm256\_maskz\_min\_epu8}\]
\[\_m256i \text{\_mm256\_maskz\_min\_epu8}(\_mmask32 k, \_m256i a, \_m256i b)\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[\text{\_mm512\_mask\_min\_epu8}\]
\[\_m512i \text{\_mm512\_mask\_min\_epu8}(\_m512i src, \_mmask64 k, \_m512i a, \_m512i b)\]

CPUID Flags: AVX512BW

Instruction(s): vpminub
Compare packed unsigned 8-bit integers in \(a\) and \(b\), and store packed minimum values in the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\textit{\_mm512\_maskz\_min\_epu8}

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpsubusb
Subtract packed unsigned 8-bit integers in b from packed unsigned 8-bit integers in a using saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_subs_epu8

__m128i_mm_maskz_subs_epu8(__mmask16 k, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpsubusb
Subtract packed unsigned 8-bit integers in b from packed unsigned 8-bit integers in a using saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_subs_epu8

__m256i_mm256_mask_subs_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpsubusb
Subtract packed unsigned 8-bit integers in b from packed unsigned 8-bit integers in a using saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_subs_epu8

__m256i_mm256_maskz_subs_epu8(__mmask32 k, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpsubusb
Subtract packed unsigned 8-bit integers in b from packed unsigned 8-bit integers in a using saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).
**_mm512_mask_subs_epu8_**

```c
_m512i _mm512_mask_subs_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in `b` from packed unsigned 8-bit integers in `a` using saturation, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm512_maskz_subs_epu8_**

```c
_m512i _mm512_maskz_subs_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in `b` from packed unsigned 8-bit integers in `a` using saturation, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm512_subs_epu8_**

```c
_m512i _mm512_subs_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in `b` from packed unsigned 8-bit integers in `a` using saturation, and return the results.

**_mm_mask_subs_epu16_**

```c
_m128i _mm_mask_subs_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in `b` from packed unsigned 16-bit integers in `a` using saturation, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm_maskz_subs_epu16_**

```c
_m128i _mm_maskz_subs_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in `b` from packed unsigned 16-bit integers in `a` using saturation, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_subs_epu16_**

CPUID Flags: AVX512IFMA52
Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of \(b\) and \(c\) to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in \(a\), and return the result using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Bit Manipulation Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the zmmintrin.h header file.
To use these intrinsics, include the immintrin.h file as follows:

```
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td>k</td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td>a</td>
<td>first source vector element</td>
</tr>
</tbody>
</table>

_mm_lzcnt_epi32

__m128i _mm_lzcnt_epi32(__m128i a);

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntd
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results.

__mm_mask_lzcnt_epi32

__m128i __mm_mask_lzcnt_epi32(__m128i src, __mmask8 k, __m128i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntd
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm_maskz_lzcnt_epi32

__m128i __mm_maskz_lzcnt_epi32(__mmask8 k, __m128i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm256_lzcnt_epi32

__m256i __mm256_lzcnt_epi32(__m256i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntd
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results.

__m256i __mm256_mask_lzcnt_epi32(__m256i src, __mmask8 k, __m256i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntd
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm256_maskz_lzcnt_epi32

__m256i __mm256_maskz_lzcnt_epi32(__mmask8 k, __m256i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntd
Counts the number of leading zero bits in each packed 32-bit integer in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm_lzcnt_epi64

__m128i __mm_lzcnt_epi64(__m128i a)
CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq
Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results.

\[ \_mm\_mask\_lzcnt\_epi64 \]
\[ \_m128i \_mm\_mask\_lzcnt\_epi64(\_m128i \ src, \_mmask8 \ k, \_m128i \ a) \]

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \_mm\_maskz\_lzcnt\_epi64 \]
\[ \_m128i \_mm\_maskz\_lzcnt\_epi64(\_mmask8 \ k, \_m128i \ a) \]

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[ \_mm256\_lzcnt\_epi64 \]
\[ \_m256i \_mm256\_lzcnt\_epi64(\_m256i \ a) \]

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results.

\[ \_mm256\_mask\_lzcnt\_epi64 \]
\[ \_m256i \_mm256\_mask\_lzcnt\_epi64(\_m256i \ src, \_mmask8 \ k, \_m256i \ a) \]

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \_mm256\_maskz\_lzcnt\_epi64 \]
\[ \_m256i \_mm256\_maskz\_lzcnt\_epi64(\_mmask8 \ k, \_m256i \ a) \]

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in \( a \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[ \_mm\_multishift\_epi64\_epi8 \]
\[ \_m128i \_mm\_multishift\_epi64\_epi8(\_m128i \ a, \_m128i \ b) \]

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb
For each 64-bit element in $b$, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of $a$, and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

\_\_mm\_mask\_multishift\_epi64\_epi8

\_\_m128i \_mm\_mask\_multishift\_epi64\_epi8(\_m128i src, \_mmask16 k, \_m128i a, \_m128i b)

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb

For each 64-bit element in $b$, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of $a$, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask $k$ (elements are copied from src when the corresponding mask bit is not set).

\_\_mm\_maskz\_multishift\_epi64\_epi8

\_\_m128i \_mm\_maskz\_multishift\_epi64\_epi8(\_mmask16 k, \_m128i a, \_m128i b)

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb

For each 64-bit element in $b$, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of $a$, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

\_\_mm256\_multishift\_epi64\_epi8

\_\_m256i \_mm256\_multishift\_epi64\_epi8(\_m256i a, \_m256i b)

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb

For each 64-bit element in $b$, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of $a$, and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

\_\_mm256\_mask\_multishift\_epi64\_epi8

\_\_m256i \_mm256\_mask\_multishift\_epi64\_epi8(\_m256i src, \_mmask32 k, \_m256i a, \_m256i b)

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb

For each 64-bit element in $b$, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of $a$, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask $k$ (elements are copied from src when the corresponding mask bit is not set).

\_\_mm256\_maskz\_multishift\_epi64\_epi8

\_\_m256i \_mm256\_maskz\_multishift\_epi64\_epi8(\_mmask32 k, \_m256i a, \_m256i b)

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpmultishiftqb
For each 64-bit element in \( b \), select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of \( a \), and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{__m512i \_mm512\_multishift\_epi64\_epi8(__m512i a, __m512i b)}
\]

CPUID Flags: AVX512VBMI
Instruction(s): vpmultishiftqb

For each 64-bit element in \( b \), select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of \( a \), and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

\[
\text{__m512i \_mm512\_mask\_multishift\_epi64\_epi8(__m512 src, __mmask64 k, __m512i a, __m512i b)}
\]

CPUID Flags: AVX512VBMI
Instruction(s): vpmultishiftqb

For each 64-bit element in \( b \), select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of \( a \), and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{__m512i \_mm512\_maskz\_multishift\_epi64\_epi8(__mmask64 k, __m512i a, __m512i b)}
\]

CPUID Flags: AVX512VBMI
Instruction(s): vpmultishiftqb

For each 64-bit element in \( b \), select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of \( a \), and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

**Intrinsics for Comparison Operations**

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>src</code></td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td><code>k</code></td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td><code>a</code></td>
<td>first source vector element</td>
</tr>
<tr>
<td><code>b</code></td>
<td>second source vector element</td>
</tr>
</tbody>
</table>
variable | definition
---|---
imm | comparison predicate, which can be any of the following values:
  • _MM_CMPINT_EQ - Equal
  • _MM_CMPINT_LT - Less than
  • _MM_CMPINT_LE - Less than or Equal
  • _MM_CMPINT_NE - Not Equal
  • _MM_CMPINT_NLT - Not Less than
  • _MM_CMPINT_GE - Greater than or Equal
  • _MM_CMPINT_NLE - Not Less than or Equal
  • _MM_CMPINT_GT - Greater than

_mm_conflict_epi32

```
__m128i _mm_conflict_epi32(__m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of a for equality with all other elements in a closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.

_mm_mask_conflict_epi32

```
__m128i _mm_mask_conflict_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of a for equality with all other elements in a closer to the least significant element using writemask k (elements are copied from src when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm_maskz_conflict_epi32

```
__m128i _mm_maskz_conflict_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of a for equality with all other elements in a closer to the least significant element using zeromask k (elements are zeroed out when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm256_conflict_epi32

```
__m256i _mm256_conflict_epi32(__m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of a for equality with all other elements in a closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.
__m256_mask_conflict_epi32

__m256i __m256_mask_conflict_epi32(__m256i src, __mmask8 k, __m256i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictd
Test each 32-bit element of a for equality with all other elements in a closer to the least significant element using writemask k (elements are copied from src when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

__m256_maskz_conflict_epi32

__m256i __m256_maskz_conflict_epi32(__mmask8 k, __m256i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictd
Test each 32-bit element of a for equality with all other elements in a closer to the least significant element using zeromask k (elements are zeroed out when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

__mm_conflict_epi64

__m128i __mm_conflict_epi64(__m128i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictq
Test each 64-bit element of a for equality with all other elements in a closer to the least significant element. Each element’s comparison forms a zero extended bit vector in the return value.

__mm_mask_conflict_epi64

__m128i __mm_mask_conflict_epi64(__m128i src, __mmask8 k, __m128i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictq
Test each 64-bit element of a for equality with all other elements in a closer to the least significant element using writemask k (elements are copied from src when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

__mm_maskz_conflict_epi64

__m128i __mm_maskz_conflict_epi64(__mmask8 k, __m128i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictq
Test each 64-bit element of a for equality with all other elements in a closer to the least significant element using zeromask k (elements are zeroed out when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

__m256_conflict_epi64

__m256i __m256_conflict_epi64(__m256i a)

CPUID Flags: AVX512CD, AVX512VL
Instruction(s): vpconflictq
Test each 64-bit element of \( a \) for equality with all other elements in \( a \) closer to the least significant element. Each element’s comparison forms a zero extended bit vector in the return value.

\[
\text{_mm256_mask_conflict_epi64}
\]
\[
\_m256i \_mm256\_mask\_conflict\_epi64(\_m256i \text{src}, \_mmask8 k, \_m256i a)
\]

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq
Test each 64-bit element of \( a \) for equality with all other elements in \( a \) closer to the least significant element using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

\[
\text{_mm256_maskz_conflict_epi64}
\]
\[
\_m256i \_mm256\_maskz\_conflict\_epi64(\_mmask8 k, \_m256i a)
\]

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq
Test each 64-bit element of \( a \) for equality with all other elements in \( a \) closer to the least significant element using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set). Each element’s comparison forms a zero extended bit vector in the return value.

\[
\text{_mm_cmp_pd_mask}
\]
\[
\_mmask8 \_mm\_cmp\_pd\_mask(\_m128d a, \_m128d b, \text{const int imm})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd
Compare packed double-precision (64-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( \text{imm} \), and and put each result in the corresponding bit of the returned mask value.

\[
\text{_mm_mask_cmp_pd_mask}
\]
\[
\_mmask8 \_mm\_mask\_cmp\_pd\_mask(\_mmask8 k1, \_m128d a, \_m128d b, \text{const int imm})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd
Compare packed double-precision (64-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( \text{imm} \), and and put each result in the corresponding bit of the returned mask value using zeromask \( k1 \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{_mm256_cmp_pd_mask}
\]
\[
\_mmask8 \_mm256\_cmp\_pd\_mask(\_m256d a, \_m256d b, \text{const int imm})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd
Compare packed double-precision (64-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( \text{imm} \), and and put each result in the corresponding bit of the returned mask value.
_mm256_mask_cmp_pd_mask

__mmask8 _mm256_mask_cmp_pd_mask(__mmask8 k1, __m256d a, __m256d b, const int imm)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd

Compare packed double-precision (64-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value using zeromask \( k1 \) (elements are zeroed out when the corresponding mask bit is not set).

__mm_cmp_ps_mask

__mmask8 __mm_cmp_ps_mask(__m128 a, __m128 b, const int imm)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value.

__mm_mask_cmp_ps_mask

__mmask8 __mm_mask_cmp_ps_mask(__mmask8 k1, __m128 a, __m128 b, const int imm)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value using zeromask \( k1 \) (elements are zeroed out when the corresponding mask bit is not set).

__mm256_cmp_ps_mask

__mmask8 __mm256_cmp_ps_mask(__m256 a, __m256 b, const int imm)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value.

__mm256_mask_cmp_ps_mask

__mmask8 __mm256_mask_cmp_ps_mask(__mmask8 k1, __m256 a, __m256 b, const int imm)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value using zeromask \( k1 \) (elements are zeroed out when the corresponding mask bit is not set).

__mm_cmp_epi8_mask

__mmask16 __mm_cmp_epi8_mask(__m128i a, __m128i b, const int imm)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb
Compare packed 8-bit integers in \( a \) and \( b \) based on the comparison operand specified by \( imm \), and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmpeq_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmpeq_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in \( a \) and \( b \) for equality, and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmpge_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmpge_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in \( a \) and \( b \) for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmpgt_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmpgt_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in \( a \) and \( b \) for greater-than, and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmple_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmple_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in \( a \) and \( b \) for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmplt_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmplt_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in \( a \) and \( b \) for less-than, and and put each result in the corresponding bit of the returned mask value.

\[
_{\text{mm_cmpneq_epi8_mask}}
\]

\[
_{\text{mmask16}} \text{ _mm_cmpneq_epi8_mask(}_\text{m128i} \ a, _\text{m128i} \ b)\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ for not-equal, and and put each result in the corresponding bit of the returned mask value.

\_\_mm\_mask\_cmp\_epi8\_mask

\_\_mm\_mask\_cmp\_epi8\_mask(__mmask16 k1, __m128i a, __m128i b, const int imm)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ based on the comparison operand specified by $imm$, and and put each result in the corresponding bit of the returned mask value using zeromask $k1$ (elements are zeroed out when the corresponding mask bit is not set).

\_\_mm\_mask\_cmpeq\_epi8\_mask

\_\_mm\_mask\_cmpeq\_epi8\_mask(__mmask16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ for equality, and and put each result in the corresponding bit of the returned mask value using zeromask $k1$ (elements are zeroed out when the corresponding mask bit is not set).

\_\_mm\_mask\_cmpge\_epi8\_mask

\_\_mm\_mask\_cmpge\_epi8\_mask(__mmask16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask $k1$ (elements are zeroed out when the corresponding mask bit is not set).

\_\_mm\_mask\_cmpgt\_epi8\_mask

\_\_mm\_mask\_cmpgt\_epi8\_mask(__mmask16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask $k1$ (elements are zeroed out when the corresponding mask bit is not set).

\_\_mm\_mask\_cmple\_epi8\_mask

\_\_mm\_mask\_cmple\_epi8\_mask(__mmask16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in $a$ and $b$ for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask $k1$ (elements are zeroed out when the corresponding mask bit is not set).
__mm_mask_cmplt_epi8_mask

__m16_mm_mask_cmplt_epi8_mask(__m16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).

__mm_mask_cmpneq_epi8_mask

__m16_mm_mask_cmpneq_epi8_mask(__m16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).

__mm256_cmp_epi8_mask

__m32_mm256_cmp_epi8_mask(__m256i a, __m256i b, const int imm)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b based on the comparison operand specified by imm, and and put each result in the corresponding bit of the returned mask value.

__mm256_cmpeq_epi8_mask

__m32_mm256_cmpeq_epi8_mask(__m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for equality, and and put each result in the corresponding bit of the returned mask value.

__mm256_cmpge_epi8_mask

__m32_mm256_cmpge_epi8_mask(__m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

__mm256_cmpgt_epi8_mask

__m32_mm256_cmpgt_epi8_mask(__m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpcmpb
Compare packed 8-bit integers in \(a\) and \(b\) for greater-than, and and put each result in the corresponding bit of the returned mask value.

\[\texttt{__mm256_cmple_epi8_mask} \]  
\[
\texttt{__mmask32 \_mm256_cmple_epi8_mask(__m256i a, __m256i b)}
\]

CPUID Flags: AVX512BW, AVX512VL  
Instruction(s): vpcmpb

Compare packed 8-bit integers in \(a\) and \(b\) for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

\[\texttt{__mm256_cmplt_epi8_mask} \]  
\[

```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb
Compare packed 8-bit integers in a and b for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm512_mask_cmpgt_epi8_mask
__mmask64 __mm512_mask_cmpgt_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb
Compare packed 8-bit integers in a and b for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm512_mask_cmple_epi8_mask
__mmask64 __mm512_mask_cmple_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb
Compare packed 8-bit integers in a and b for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).
**_mm512_mask_cmplt_epi8_mask_**

```c
__m512i _mm512_mask_cmplt_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).

**_mm512_mask_cmpneq_epi8_mask_**

```c
__m512i _mm512_mask_cmpneq_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in a and b for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k1 (elements are zeroed out when the corresponding mask bit is not set).

**_mm_cmp_epi32_mask_**

```c
__m128i _mm_cmp_epi32_mask(const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b based on the comparison operand specified by imm, and and put each result in the corresponding bit of the returned mask value.

**_mm_cmpeq_epi32_mask_**

```c
__m128i _mm_cmpeq_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for equality, and and put each result in the corresponding bit of the returned mask value.

**_mm_cmpge_epi32_mask_**

```c
__m128i _mm_cmpge_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

**_mm_cmpgt_epi32_mask_**

```c
__m128i _mm_cmpgt_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for greater-than, and and put each result in the corresponding bit of the returned mask value.
Compare packed 32-bit integers in \( a \) and \( b \) for greater-than, and and put each result in the corresponding bit of the returned mask value.

\[

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epi32_mask

__mmask8 mm_mask_cmplt_epi32_mask(__mmask8 k1, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epi32_mask

__mmask8 mm_mask_cmpneq_epi32_mask(__mmask8 k1, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epi32_mask

__mmask8 mm256_cmp_epi32_mask(__m256i a, __m256i b, const _MM_CMPINT_ENUM imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd
Compare packed 32-bit integers in a and b based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epi32_mask

__mmask8 _mm256_cmpeq_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epi32_mask

__mmask8 _mm256_cmpge_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epi32_mask

__mmask8 _mm256_cmpgt_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epi32_mask

__mmask8 _mm256_cmple_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epi32_mask

__mmask8 _mm256_cmplt_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd

Compare packed 32-bit integers in a and b for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epi32_mask

__mmask8 _mm256_cmpneq_epi32_mask(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpd
Compare packed 32-bit integers in a and b for not-equal, and and put each result in the corresponding bit of the returned mask value.

`_mm256_mask_cmp_epi32_mask`

```c
__mmask8 _mm256_mask_cmp_epi32_mask(__mmask8 k1, __m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd
Compare packed 32-bit integers in a and b based on the comparison operand specified by imm, and and put each result in the corresponding bit of the returned mask value using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

`_mm256_mask_cmpeq_epi32_mask`

```c

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in $a$ and $b$ for not-equal, and and put each result in the corresponding bit of the returned mask value.

\[
\_\text{mm256\_mask\_cmp\_epu64\_mask}
\]

\[
\_\text{mmask8 \_mm256\_mask\_cmp\_epu64\_mask(\_mmask8 k1, \_m256i a, \_m256i b, const \_MM\_CMPINT\_ENUM imm)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in $a$ and $b$ based on the comparison operand specified by $imm$, and and put each result in the corresponding bit of the returned mask value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

\[
\_\text{mm256\_mask\_cmpeq\_epu64\_mask}
\]

\[
\_\text{mmask8 \_mm256\_mask\_cmpeq\_epu64\_mask(\_mmask8 k1, \_m256i a, \_m256i b)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in $a$ and $b$ for equality, and and put each result in the corresponding bit of the returned mask value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

\[
\_\text{mm256\_mask\_cmpge\_epu64\_mask}
\]

\[
\_\text{mmask8 \_mm256\_mask\_cmpge\_epu64\_mask(\_mmask8 k1, \_m256i a, \_m256i b)}
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\) for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_cmpgt_epu64_mask_**

\[
\text{__mmask8 _mm256_mask_cmpgt_epu64_mask(__mmask8 k1, __m256i a, __m256i b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in \(a\) and \(b\) for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_cmple_epu64_mask_**

\[

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm_mask_testn_epi8_mask

_mm_mask_testn_epi8_mask(__mmask16 k1, __m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in a and b, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask k) if the intermediate value is zero.

_mm_testn_epi8_mask

_mm_testn_epi8_mask(__m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in a and b, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi8_mask

_mm256_mask_testn_epi8_mask(__mmask32 k1, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vptestnmb
Compute the bitwise AND of packed 8-bit integers in \(a\) and \(b\), producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask \(k\)) if the intermediate value is zero.

\textbf{\_mm256\_testn\_epi8\_mask}

\[
\text{\_mmask32 } \text{\_mm256\_testn\_epi8\_mask}(\text{\_m256i } a, \text{\_m256i } b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpptestnmb

Compute the bitwise AND of packed 8-bit integers in \(a\) and \(b\), producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\textbf{\_mm512\_mask\_testn\_epi8\_mask}

\[
\text{\_mmask64 } \text{\_mm512\_mask\_testn\_epi8\_mask}(\text{\_mmask64 } k1, \text{\_m512i } a, \text{\_m512i } b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpptestnmb

Compute the bitwise AND of packed 8-bit integers in \(a\) and \(b\), producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\textbf{\_mm512\_testn\_epi8\_mask}

\[
\text{\_mmask64 } \text{\_mm512\_testn\_epi8\_mask}(\text{\_m512i } a, \text{\_m512i } b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpptestnmb

Compute the bitwise AND of packed 8-bit integers in \(a\) and \(b\), producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\textbf{\_mm\_mask\_testn\_epi32\_mask}

\[
\text{\_mmask8 } \text{\_mm\_mask\_testn\_epi32\_mask}(\text{\_mmask8 } k1, \text{\_m128i } a, \text{\_m128i } b)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpptestnmd

Compute the bitwise AND of packed 32-bit integers in \(a\) and \(b\), producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask \(k\)) if the intermediate value is zero.

\textbf{\_mm\_testn\_epi32\_mask}

\[
\text{\_mmask8 } \text{\_mm\_testn\_epi32\_mask}(\text{\_m128i } a, \text{\_m128i } b)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpptestnmd

Compute the bitwise AND of packed 32-bit integers in \(a\) and \(b\), producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\textbf{\_mm256\_mask\_testn\_epi32\_mask}

\[
\text{\_mmask8 } \text{\_mm256\_mask\_testn\_epi32\_mask}(\text{\_mmask8 } k1, \text{\_m256i } a, \text{\_m256i } b)
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vptestnmd
Compute the bitwise AND of packed 32-bit integers in \(a\) and \(b\), producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask \(k\)) if the intermediate value is zero.

\[ \text{_mm256_testn_epi32_mask} \]
\[ \text{__mmask8 } _\text{mm256_testn_epi32_mask} (__m256i \ a, __m256i \ b) \]
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmd
Compute the bitwise AND of packed 32-bit integers in \(a\) and \(b\), producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\[ \text{_mm_mask_testn_epi64_mask} \]
\[ \text{__mmask8 } _\text{mm_mask_testn_epi64_mask} (\text{__mmask8 } k1, __m128i \ a, __m128i \ b) \]
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq
Compute the bitwise AND of packed 64-bit integers in \(a\) and \(b\), producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask \(k\)) if the intermediate value is zero.

\[ \text{_mm_testn_epi64_mask} \]
\[ \text{__mmask8 } _\text{mm_testn_epi64_mask} (__m128i \ a, __m128i \ b) \]
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq
Compute the bitwise AND of packed 64-bit integers in \(a\) and \(b\), producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\[ \text{_mm256_mask_testn_epi64_mask} \]
\[ \text{__mmask8 } _\text{mm256_mask_testn_epi64_mask} (\text{__mmask8 } k1, __m256i \ a, __m256i \ b) \]
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq
Compute the bitwise AND of packed 64-bit integers in \(a\) and \(b\), producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask \(k\)) if the intermediate value is zero.

\[ \text{_mm256_testn_epi64_mask} \]
\[ \text{__mmask8 } _\text{mm256_testn_epi64_mask} (__m256i \ a, __m256i \ b) \]
CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq
Compute the bitwise AND of packed 64-bit integers in \(a\) and \(b\), producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

\[ \text{_mm_mask_testn_epi16_mask} \]
\[ \text{__mmask8 } _\text{mm_mask_testn_epi16_mask} (\text{__mmask8 } k1, __m128i \ a, __m128i \ b) \]
CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask k) if the intermediate value is zero.

_mm_testn_epi16_mask

__m128i_mm_testn_epi16_mask(__m128i a, __m128i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi16_mask

__mmask16_mm256_mask_testn_epi16_mask(__m256i k1, __m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_testn_epi16_mask

__m256i_mm256_testn_epi16_mask(__m256i a, __m256i b)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm512_mask_testn_epi16_mask

__mmask32_mm512_mask_testn_epi16_mask(__mmask32 k1, __m512i a, __m512i b)

CPUID Flags: AVX512BW

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask k) if the intermediate value is zero.

_mm512_testn_epi16_mask

__m512i_mm512_testn_epi16_mask(__m512i a, __m512i b)

CPUID Flags: AVX512BW

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in a and b, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.
Intrinsics for Conversion Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the immintrin.h header file.

To use these intrinsics, include the immintrin.h file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td>k</td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td>a</td>
<td>first source vector element</td>
</tr>
</tbody>
</table>

**rounding**

Rounding control values; these can be one of the following (along with the sae suppress all exceptions flag):

- `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even
- `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity
- `_MM_FROUND_TO_POS_INF` - rounds to positive infinity
- `_MM_FROUND_TO_ZERO` - rounds to zero
- `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register

### `_mm_mask_cvtpd_ps`

```c
__m128 _mm_mask_cvtpd_ps(__m128 src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

### `_mm_maskz_cvtpd_ps`

```c
__m128 _mm_maskz_cvtpd_ps(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

### `_mm256_mask_cvtpd_ps`

```c
__m128 _mm256_mask_cvtpd_ps(__m128 src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).
Convert packed double-precision (64-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_{\text{mm256}}\text{maskz_cvtpd_ps}
\]
\[
_{\text{m128}} \text{mm256_maskz_cvtpd_ps}(_{\text{mmask8}} k, _{\text{m256d}} a)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtstp2ps

Convert packed double-precision (64-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm_mask_cvtpd_ps}}
\]
\[
_{\text{m128}} \text{mm_mask_cvtpd_ps}(_{\text{m128}} src, _{\text{mmask8}} k, _{\text{ml28i}} a)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtstp2ps

Convert packed half-precision (16-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_{\text{mm_mask_cvtph_ps}}
\]
\[
_{\text{m128}} \text{mm_mask_cvtph_ps}(_{\text{mmask8}} k, _{\text{ml28i}} a)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256_mask_cvtph_ps}}
\]
\[
_{\text{m256}} \text{mm256_mask_cvtph_ps}(_{\text{m256}} src, _{\text{mmask8}} k, _{\text{ml28i}} a)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_{\text{mm256_maskz_cvtph_ps}}
\]
\[
_{\text{m256}} \text{mm256_maskz_cvtph_ps}(_{\text{mmask8}} k, _{\text{ml28i}} a)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in \( a \) to packed single-precision (32-bit) floating-point elements, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).
__mm_mask_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m128 a, int rounding)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm_mask_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m128 a, int rounding)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm_maskz_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m128 a, int rounding)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm_maskz_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m128 a, int rounding)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm256_mask_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m256 a, int rounding)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm256_mask_cvt_roundps_ph

__m128i __m128i __m128i __m128i src (__m128i src, __mmask8 k, __m256 a, int rounding)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_cvt_roundps_ph

_m128i _mm256_maskz_cvt_roundps_ph(__mmask8 k, __m256 a, int rounding)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_cvtps_ph

_m128i _mm256_maskz_cvtps_ph(__mmask8 k, __m256 a, int rounding)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtps2ph
Convert packed single-precision (32-bit) floating-point elements in a to packed half-precision (16-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi32_pd

_m128d _mm_mask_cvtepi32_pd(__m128d src, __mmask8 k, __m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtdq2pd
Convert packed 32-bit integers in a to packed double-precision (64-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_pd

_m128d _mm_maskz_cvtepi32_pd(__mmask8 k, __m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtdq2pd
Convert packed 32-bit integers in a to packed double-precision (64-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi32_pd

_m256d _mm256_mask_cvtepi32_pd(__m256d src, __mmask8 k, __m128i a)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcvtdq2pd
Convert packed 32-bit integers in a to packed double-precision (64-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).
**_mm256_maskz_cvtepi32_pd**

```
_m256d_mm256_maskz_cvtepi32_pd(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2pd

Convert packed 32-bit integers in `a` to packed double-precision (64-bit) floating-point elements, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm_mask_cvtepi32_ps**

```
_m128_mm_mask_cvtepi32_ps(__m128 src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in `a` to packed single-precision (32-bit) floating-point elements, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm_maskz_cvtepi32_ps**

```
_m128_mm_maskz_cvtepi32_ps(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in `a` to packed single-precision (32-bit) floating-point elements, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_cvtepi32_ps**

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtuqq2ps
Convert packed unsigned 64-bit integers in `a` to packed single-precision (32-bit) floating-point elements, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```cpp
__m128_mm256_maskz_cvtepu64_ps(__mmask8 k, __m256i a)
```
CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtuqq2ps
Convert packed unsigned 64-bit integers in `a` to packed single-precision (32-bit) floating-point elements, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```cpp
__m256_mm512_cvt_roundepu64_ps(__m512i a, int rounding)
```
CPUID Flags: AVX512DQ

Instruction(s): vcvtuqq2ps
Convert packed unsigned 64-bit integers in `a` to packed single-precision (32-bit) floating-point elements, and return the results.
_mm512_cvtepu64_ps

__m256 __m512_cvtepu64_ps(__m512i a)

CPUID Flags: AVX512DQ
Instruction(s): cvtuqq2ps
Convert packed unsigned 64-bit integers in a to packed single-precision (32-bit) floating-point elements, and return the results.

__m512_mask_cvt_roundepu64_ps

__m256 __m512_mask_cvt_roundepu64_ps(__m256 src, __mmask8 k, __m512i a, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): cvtuqq2ps
Convert packed unsigned 64-bit integers in a to packed single-precision (32-bit) floating-point elements, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__m512_maskz_cvtepu64_ps

__m256 __m512_maskz_cvtepu64_ps(__mmask8 k, __m512i a)

CPUID Flags: AVX512DQ
Instruction(s): cvtuqq2ps
Convert packed unsigned 64-bit integers in a to packed single-precision (32-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__m512_maskz_cvtepu64_ps

__m256 __m512_maskz_cvtepu64_ps(__mmask8 k, __m512i a)

CPUID Flags: AVX512DQ
Instruction(s): cvtuqq2ps
Convert packed unsigned 64-bit integers in a to packed single-precision (32-bit) floating-point elements, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from a and b to packed 8-bit integers using signed saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

**_mm_maskz_packs_epi16**

```cpp
__m128i __m_maskz_packs_epi16(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from a and b to packed 8-bit integers using signed saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_packs_epi16**

```cpp
__m256i __m256_mask_packs_epi16(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from a and b to packed 8-bit integers using signed saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

**_mm256_maskz_packs_epi16**

```cpp
__m256i __m256_maskz_packs_epi16(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from a and b to packed 8-bit integers using signed saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

**_mm512_mask_packs_epi16**

```cpp
__m512i __m512_mask_packs_epi16(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpacksswb
Convert packed 16-bit integers from \( a \) and \( b \) to packed 8-bit integers using signed saturation, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{\_mm512\_maskz\_packs\_epi16}
\]
\[
\text{\_m512i \_mm512\_maskz\_packs\_epi16(___mmask64 k, \_m512i a, \_m512i b)}
\]

CPUID Flags: AVX512BW
Instruction(s): vpacksswb

Convert packed 16-bit integers from \( a \) and \( b \) to packed 8-bit integers using signed saturation, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\_mm512\_packs\_epi16}
\]
\[
\text{\_m512i \_mm512\_packs\_epi16(___m512i a, ___m512i b)}
\]

CPUID Flags: AVX512BW
Instruction(s): vpacksswb

Convert packed 16-bit integers from \( a \) and \( b \) to packed 8-bit integers using signed saturation, and return the results.

\[
\text{\_mm\_mask\_packus\_epi32}
\]
\[
\text{\_m128i \_mm\_mask\_packus\_epi32(___m128i src, __mmask8 k, ___m128i a, ___m128i b)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpackusdw

Convert packed 32-bit integers from \( a \) and \( b \) to packed 16-bit integers using unsigned saturation, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{\_mm\_maskz\_packus\_epi32}
\]
\[
\text{\_m128i \_mm\_maskz\_packus\_epi32(__mmask8 k, ___m128i a, ___m128i b)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpackusdw

Convert packed 32-bit integers from \( a \) and \( b \) to packed 16-bit integers using unsigned saturation, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{\_mm256\_mask\_packus\_epi32}
\]
\[
\text{\_m256i \_mm256\_mask\_packus\_epi32(___m256i src, __mmask16 k, ___m256i a, ___m256i b)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpackusdw

Convert packed 32-bit integers from \( a \) and \( b \) to packed 16-bit integers using unsigned saturation, and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{\_mm256\_maskz\_packus\_epi32}
\]
\[
\text{\_m256i \_mm256\_maskz\_packus\_epi32(__mmask16 k, ___m256i a, ___m256i b)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpackusdw
Convert packed 32-bit integers from a and b to packed 16-bit integers using unsigned saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_packus_epi32
__m512i _mm512_mask_packus_epi32(__m512i src, __mmask32 k, __m512i a, __m512i b)
CPUID Flags: AVX512BW

Instruction(s): vpackusdw
Convert packed 32-bit integers from a and b to packed 16-bit integers using unsigned saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm512_maskz_packus_epi32
__m512i _mm512_maskz_packus_epi32(__mmask32 k, __m512i a, __m512i b)
CPUID Flags: AVX512BW

Instruction(s): vpackusdw
Convert packed 32-bit integers from a and b to packed 16-bit integers using unsigned saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512_packus_epi32
__m512i _mm512_packus_epi32(__m512i a, __m512i b)
CPUID Flags: AVX512BW

Instruction(s): vpackusdw
Convert packed 32-bit integers from a and b to packed 16-bit integers using unsigned saturation, and return the results.

_mm_mask_packus_epi16
__m128i _mm_mask_packus_epi16(__m128i src, __mmask16 k, __m128i a, __m128i b)
CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb
Convert packed 16-bit integers from a and b to packed 8-bit integers using unsigned saturation, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_packus_epi16
__m128i _mm_maskz_packus_epi16(__mmask16 k, __m128i a, __m128i b)
CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb
Convert packed 16-bit integers from a and b to packed 8-bit integers using unsigned saturation, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_packus_epi16

\[
_{\text{m}512i \_\text{mm512\_packus\_epi16}(\_\text{m}512i \ a, \ _\text{m}512i \ b)}
\]

CPUID Flags: AVX512BW
Instruction(s): vpackuswb

Convert packed 16-bit integers from \(a\) and \(b\) to packed 8-bit integers using unsigned saturation, and return the results.

\[
_{\text{mm\_mask\_cvtepi32\_storeu\_epi8}}
\]

\[
\text{void \_mm\_mask\_cvtepi32\_storeu\_epi8(\_mm\_mask\_8 k, \ _\text{m}128i \ a)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovdb

Convert packed 32-bit integers in \(a\) to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask \(k\)) to unaligned memory at \(base\_addr\).
_mm256_mask_cvtepi32_storeu_epi8

```c
void _mm256_mask_cvtepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovdb

Convert packed 32-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

__mm_mask_cvtepi32_storeu_epi16

```c
void __mm_mask_cvtepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovdw

Convert packed 32-bit integers in `a` to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

__mm256_mask_cvtepi32_storeu_epi16

```c
void __mm256_mask_cvtepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovdw

Convert packed 32-bit integers in `a` to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

__mm_mask_cvtepi64_storeu_epi8

```c
void __mm_mask_cvtepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovqb

Convert packed 64-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

__mm256_mask_cvtepi64_storeu_epi8

```c
void __mm256_mask_cvtepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovqb

Convert packed 64-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

__mm_mask_cvtepi64_storeu_epi32

```c
void __mm_mask_cvtepi64_storeu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovqd

Convert packed 64-bit integers in `a` to packed 32-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`. 
_mm256_mask_cvtepi64_storeu_epi32

```c
void _mm256_mask_cvtepi64_storeu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in `a` to packed 32-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm_mask_cvtepi64_storeu_epi16

```c
void _mm_mask_cvtepi64_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovq

Convert packed 64-bit integers in `a` to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm256_mask_cvtepi64_storeu_epi16

```c
void _mm256_mask_cvtepi64_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovq

Convert packed 64-bit integers in `a` to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_ mm_mask_cvtsepi32_storeu_epi8

```c
void _mm_mask_cvtsepi32_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_ mm256_mask_cvtsepi32_storeu_epi8

```c
void _mm256_mask_cvtsepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_ mm_mask_cvtsepi32_storeu_epi16

```c
void _mm_mask_cvtsepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsd

Convert packed 32-bit integers in `a` to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`. 
_mm256_mask_cvtsepi32_storeu_epi16

```c
void _mm256_mask_cvtsepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in `a` to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm_mask_cvtsepi64_storeu_epi8

```c
void _mm_mask_cvtsepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm256_mask_cvtsepi64_storeu_epi8

```c
void _mm256_mask_cvtsepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm_mask_cvtsepi64_storeu_epi32

```c
void _mm_mask_cvtsepi64_storeu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in `a` to packed 32-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm256_mask_cvtsepi64_storeu_epi32

```c
void _mm256_mask_cvtsepi64_storeu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in `a` to packed 32-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

_mm_mask_cvtsepi64_storeu_epi16

```c
void _mm_mask_cvtsepi64_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw
Convert packed 64-bit integers in `a` to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm256_mask_cvtsepi64_storeu_epi16
void _mm256_mask_cvtsepi64_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vpmovsqw`

Convert packed 64-bit integers in `a` to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm_mask_cvtsepi16_storeu_epi8
void _mm_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): `vpmovswb`

Convert packed 16-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm256_mask_cvtsepi16_storeu_epi8
void _mm256_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): `vpmovswb`

Convert packed 16-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm512_mask_cvtsepi16_storeu_epi8
void _mm512_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): `vpmovswb`

Convert packed 16-bit integers in `a` to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm_mask_cvtusepi32_storeu_epi8
void _mm_mask_cvtusepi32_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vpmovusdb`

Convert packed unsigned 32-bit integers in `a` to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

```c
_mm256_mask_cvtusepi32_storeu_epi8
void _mm256_mask_cvtusepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovusdb
Convert packed unsigned 32-bit integers in a to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask k) to unaligned memory at base_addr.

_mm_mask_cvtusepi32_storeu_epi16

```c
void _mm_mask_cvtusepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw
Convert packed unsigned 32-bit integers in a to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask k) to unaligned memory at base_addr.

_mm256_mask_cvtusepi32_storeu_epi16

```c
void _mm256_mask_cvtusepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb
Convert packed unsigned 64-bit integers in a to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask k) to unaligned memory at base_addr.

_mm_mask_cvtusepi64_storeu_epi8

```c
void _mm_mask_cvtusepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd
Convert packed unsigned 64-bit integers in a to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask k) to unaligned memory at base_addr.

_mm256_mask_cvtusepi64_storeu_epi8

```c
void _mm256_mask_cvtusepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd
Convert packed unsigned 64-bit integers in \( a \) to packed unsigned 32-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask \( k \)) to unaligned memory at \( base\_addr \).

\[
_mm256\_mask\_cvtusepi64\_storeu\_epi32
\]

\[
\text{void } \_\text{mm256\_mask\_cvtusepi64\_storeu\_epi32}(\text{void* } \text{base\_addr}, \_\text{mmask8 } k, \_\text{m256i } a)
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovusqd
Convert packed unsigned 64-bit integers in \( a \) to packed unsigned 32-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask \( k \)) to unaligned memory at \( base\_addr \).

\[
_mm\_mask\_cvtusepi64\_storeu\_epi16

\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpmovusqw
Convert packed unsigned 64-bit integers in \( a \) to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask \( k \)) to unaligned memory at \( base\_addr \).

\[
_mm\_mask\_cvtusepi16\_storeu\_epi8
\]

\[
\text{void } \_\text{mm\_mask\_cvtusepi16\_storeu\_epi8}(\text{void* } \text{base\_addr}, \_\text{mmask8 } k, \_\text{m128i } a)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovuswb
Convert packed unsigned 16-bit integers in \( a \) to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask \( k \)) to unaligned memory at \( base\_addr \).

\[
_mm256\_mask\_cvtusepi16\_storeu\_epi8
\]

\[
\text{void } \_\text{mm256\_mask\_cvtusepi16\_storeu\_epi8}(\text{void* } \text{base\_addr}, \_\text{mmask16 } k, \_\text{m256i } a)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovuswb
Convert packed unsigned 16-bit integers in \( a \) to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask \( k \)) to unaligned memory at \( base\_addr \).
**_mm512_mask_cvtusepi16_storeu_epi8_**

```c
void _mm512_mask_cvtusepi16_storeu_epi8(void* base_addr, __m512i a)
```

CPUID Flags: AVX512BW
Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in `a` to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

**_mm_mask_cvtepi16_storeu_epi8_**

```c
void _mm_mask_cvtepi16_storeu_epi8(void* base_addr, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovwb

Convert packed 16-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

**_mm256_mask_cvtepi16_storeu_epi8_**

```c
void _mm256_mask_cvtepi16_storeu_epi8(void* base_addr, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovwb

Convert packed 16-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

**_mm512_mask_cvtepi16_storeu_epi8_**

```c
void _mm512_mask_cvtepi16_storeu_epi8(void* base_addr, __m512i a)
```

CPUID Flags: AVX512BW
Instruction(s): vpmovwb

Convert packed 16-bit integers in `a` to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask `k`) to unaligned memory at `base_addr`.

**Intrinsics for Load Operations**

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td>k</td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td>mem_addr</td>
<td>pointer to base address in memory</td>
</tr>
<tr>
<td>variable</td>
<td>definition</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>base_addr</td>
<td>pointer to base address in memory to begin load or store operation</td>
</tr>
</tbody>
</table>

_mm_mask_expandloadu_pd

```c
__m256d __m_mask_expandloadu_pd(__m256d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at mem_addr as there are ones in the low 4 bits of mask k, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_expandloadu_pd

```c
__m256d __m_maskz_expandloadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at mem_addr as there are ones in the low 4 bits of mask k, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expandloadu_pd

```c
__m256d __m256_mask_expandloadu_pd(__m256d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at mem_addr as there are ones in the low 4 bits of mask k, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_expandloadu_pd

```c
__m256d __m256_maskz_expandloadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at mem_addr as there are ones in the low 4 bits of mask k, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_expandloadu_ps

```c
__m128 __m_mask_expandloadu_ps(__m128 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at
mem_addr as there are ones in the low 4 bits of mask k, and place them in the result element positions
(corresponding to the positions of the ones in the mask (elements are copied from src when the
resulting mask bit is not set).

__m128_mm_maskz_expandloadu_ps

__m128 _mm_maskz_expandloadu_ps(__mmask8 k, void const* mem_addr)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at
mem_addr as there are ones in the low 8 bits of mask k, and place them in the result element positions
(corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding
mask bit is not set).

__m256_mm_maskz_expandloadu_ps

__m256 _mm256_maskz_expandloadu_ps(__mmask8 k, void const* mem_addr)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at
mem_addr as there are ones in the low 8 bits of mask k, and place them in the result element positions
(corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding
mask bit is not set).

__m256_mm_maskz_expandloadu_ps

__m256 _mm256_maskz_expandloadu_ps(__mmask8 k, void const* mem_addr)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at
mem_addr as there are ones in the low 8 bits of mask k, and place them in the result element positions
(corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding
mask bit is not set).

__m128d_mm_maskz_i32gather_pd

__m128d _mm_maskz_i32gather_pd(__m128d src, __mmask8 k, __m128i vindex, void const* base_addr,
const int scale)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgatherdpd
Gather double-precision (64-bit) floating-point elements from memory using 32-bit indices. 64-bit elements
are loaded from addresses starting at base_addr and offset by each 32-bit element in vindex (each index is
scaled by the factor in scale). Gathered elements are merged into the return value using writemask k
(elements are copied from src when the corresponding mask bit is not set). scale should be 1, 2, 4 or 8.
__m256_mm5mask_i32gather_pd

__m256d_mm256_mm5mask_i32gather_pd(__m256d src, __mmask8 k, __m128i vindex, void const* base_addr, const int scale)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdpd

Gather double-precision (64-bit) floating-point elements from memory using 32-bit indices. 64-bit elements are loaded from addresses starting at base_addr and offset by each 32-bit element in vindex (each index is scaled by the factor in scale). Gathered elements are merged into the return value using writemask k (elements are copied from src when the corresponding mask bit is not set). scale should be 1, 2, 4 or 8.

__m5mask_i32gather_ps

__m128_mm5mask_i32gather_ps(__m128 src, __mmask8 k, __m128i vindex, void const* base_addr, const int scale)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdps

Gather single-precision (32-bit) floating-point elements from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at base_addr and offset by each 32-bit element in vindex (each index is scaled by the factor in scale). Gathered elements are merged into the return value using writemask k (elements are copied from src when the corresponding mask bit is not set). scale should be 1, 2, 4 or 8.

__m256_mm5mask_i32gather_ps

__m256d_mm256_mm5mask_i32gather_ps(__m256d src, __mmask8 k, __m256i vindex, void const* base_addr, const int scale)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdps

Gather single-precision (32-bit) floating-point elements from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at base_addr and offset by each 32-bit element in vindex (each index is scaled by the factor in scale). Gathered elements are merged into the return value using writemask k (elements are copied from src when the corresponding mask bit is not set). scale should be 1, 2, 4 or 8.

__mmask_i64gather_pd

__m128d_mm5mask_i64gather_pd(__m128d src, __mmask8 k, __m128i vindex, void const* base_addr, const int scale)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqd

Gather double-precision (64-bit) floating-point elements from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at base_addr and offset by each 64-bit element in vindex (each index is scaled by the factor in scale). Gathered elements are merged into the return value using writemask k (elements are copied from src when the corresponding mask bit is not set). scale should be 1, 2, 4 or 8.

__m256_mm5mask_i64gather_pd

__m256d_mm256_mm5mask_i64gather_pd(__m256d src, __mmask8 k, __m256i vindex, void const* base_addr, const int scale)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgatherqpd
Gather double-precision (64-bit) floating-point elements from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at `base_addr` and offset by each 64-bit element in `vindex` (each index is scaled by the factor in `scale`). Gathered elements are merged into the return value using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). `scale` should be 1, 2, 4 or 8.

```c
__m128 __mmask_i64gather_ps(__m128 src, __mmask8 k, __m128i vindex, void const* base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqps
Gather single-precision (32-bit) floating-point elements from memory using 64-bit indices. 32-bit elements are loaded from addresses starting at `base_addr` and offset by each 64-bit element in `vindex` (each index is scaled by the factor in `scale`). Gathered elements are merged into the return value using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). `scale` should be 1, 2, 4 or 8.

```c
__m128 __mm256_mmask_i64gather_ps(__m128 src, __mmask8 k, __m256i vindex, void const* base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd
Load packed double-precision (64-bit) floating-point elements from memory into the return value using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). `mem_addr` must be aligned on a 16-byte boundary or a general-protection exception may be generated.

```c
__m128d __mm_mask_load_pd(__m128d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd
Load packed double-precision (64-bit) floating-point elements from memory into the return value using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set). `mem_addr` must be aligned on a 16-byte boundary or a general-protection exception may be generated.

```c
__m256d __mm256_mask_load_pd(__m256d src, __mmask8 k, void const* mem_addr)
```
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovapd
Load packed double-precision (64-bit) floating-point elements from memory into the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). \( \text{mem}_\text{addr} \) must be aligned on a 32-byte boundary or a general-protection exception may be generated.

\[ \text{_mm256_maskz_load_pd} \]
\[ \_m256d \_mm256_maskz_load_pd(__mmask8 k, void const* \text{mem}_\text{addr}) \]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovapd
Load packed double-precision (64-bit) floating-point elements from memory into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set). \( \text{mem}_\text{addr} \) must be aligned on a 32-byte boundary or a general-protection exception may be generated.

\[ \text{_mm_mask_load_ps} \]
\[ \_m128 \_mm_mask_load_ps(_m128 \text{src}, __mmask8 k, void const* \text{mem}_\text{addr}) \]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps
Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). \( \text{mem}_\text{addr} \) must be aligned on a 16-byte boundary or a general-protection exception may be generated.

\[ \text{_mm_maskz_load_ps} \]
\[ \_m128 \_mm_maskz_load_ps(__mmask8 k, void const* \text{mem}_\text{addr}) \]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps
Load packed single-precision (32-bit) floating-point elements from memory into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set). \( \text{mem}_\text{addr} \) must be aligned on a 16-byte boundary or a general-protection exception may be generated.

\[ \text{_mm256_mask_load_ps} \]
\[ \_m256 \_mm256_mask_load_ps(_m256 \text{src}, __mmask8 k, void const* \text{mem}_\text{addr}) \]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps
Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set). \( \text{mem}_\text{addr} \) must be aligned on a 32-byte boundary or a general-protection exception may be generated.

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpgatherqq

Gather 64-bit integers from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at `base_addr` and offset by each 64-bit element in `vindex` (each index is scaled by the factor in `scale`). Gathered elements are merged into the return value using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). `scale` should be 1, 2, 4 or 8.

**Intrinsics for Logical Operations**

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file. To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>src</code></td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td><code>k</code></td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td><code>a</code></td>
<td>first source vector element</td>
</tr>
<tr>
<td><code>b</code></td>
<td>second source vector element</td>
</tr>
<tr>
<td><code>c</code></td>
<td>third source vector element</td>
</tr>
<tr>
<td><code>imm</code></td>
<td>comparison predicate, which can be any of the following values:</td>
</tr>
<tr>
<td></td>
<td>• <code>_MM_CMPINT_EQ</code> - Equal</td>
</tr>
<tr>
<td></td>
<td>• <code>_MM_CMPINT_LT</code> - Less than</td>
</tr>
<tr>
<td></td>
<td>• <code>_MM_CMPINT_LE</code> - Less than or Equal</td>
</tr>
<tr>
<td></td>
<td>• <code>_MM_CMPINT_NE</code> - Not Equal</td>
</tr>
<tr>
<td></td>
<td>• <code>_MM_CMPINT_NLT</code> - Not Less than</td>
</tr>
<tr>

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandnps
Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in \(a\) and \(b\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_mm512\_andnot\_ps
\]
\[
_m512\_mm512\_andnot\_ps(_m512\ a, _m512\ b)
\]
CPUID Flags: AVX512DQ
Instruction(s): vandnps
Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in \(a\) and \(b\), and return the results.

\[
_mm512\_mask\_andnot\_ps
\]
\[
_m512\_mm512\_mask\_andnot\_ps(_mmask16\ k, _m512\ a, _m512\ b)
\]
CPUID Flags: AVX512DQ
Instruction(s): vandnps
Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in \(a\) and \(b\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).
__mm512_maskz_andnot_ps

__m512 __mm512_maskz_andnot_ps(__mmask16 k, __m512 a, __m512 b)

CPUID Flags: AVX512DQ
Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

__mm_mask_and_pd

__m128d __mm_mask_and_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

__mm_maskz_and_pd

__m128d __mm_maskz_and_pd(__mmask8 k, __m128d a, __m128d b)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

__mm256_mask_and_pd

__m256d __mm256_mask_and_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

__mm256_maskz_and_pd

__m256d __mm256_maskz_and_pd(__mmask8 k, __m256d a, __m256d b)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

__mm512_and_pd

__m512d __mm512_and_pd(__m512d a, __m512d b)

CPUID Flags: AVX512DQ
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results.
**_mm512_mask_and_pd_**

```cpp
__m512d _mm512_mask_and_pd(__m512d src, __mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm512_maskz_and_pd_**

```cpp
__m512d _mm512_maskz_and_pd(__mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ
Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

**_mm_mask_and_ps_**

```cpp
__m128 _mm_mask_and_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm_maskz_and_ps_**

```cpp
__m128 _mm_maskz_and_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_and_ps_**

```cpp
__m256 _mm256_mask_and_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm256_maskz_and_ps_**

```cpp
__m256 _mm256_maskz_and_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vandps
Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in $a$ and $b$, and return the results using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

\texttt{__m512\_and\_ps}

\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpandnq
Compute the bitwise AND of packed 64-bit integers in \( a \) and \( b \), and return the results using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[
_{\text{mm256}}_{\text{maskz_and_epi64}}
\]
\[
_{\text{m256i}}_{\text{mm256_maskz_and_epi64}}(_{\text{mmask8}} k, _{\text{m256i}} a, _{\text{m256i}} b)
\]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpand
Compute the bitwise AND of packed 64-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_or_epi32

_m128i _mm_mask_or_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpord
Compute the bitwise OR of packed 32-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_or_epi32

_m128i _mm_maskz_or_epi32(__mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpord
Compute the bitwise OR of packed 32-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_epi32

_m256i _mm256_mask_or_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpord
Compute the bitwise OR of packed 32-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_or_epi32

_m256i _mm256_maskz_or_epi32(__mmask8 k, __m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpord
Compute the bitwise OR of packed 32-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_or_epi64

_m128i _mm_mask_or_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vporq
Compute the bitwise OR of packed 64-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).
_mm_maskz_or_epi64

_m128i _mm_maskz_or_epi64(__mmask8 k, _m128i a, _m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vporq
Compute the bitwise OR of packed 64-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_epi64

_m256i _mm256_mask_or_epi64(__m256i src, __mmask8 k, _m256i a, _m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vporq
Compute the bitwise OR of packed 64-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_or_epi64

_m256i _mm256_maskz_or_epi64(__mmask8 k, _m256i a, _m256i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vporq
Compute the bitwise OR of packed 64-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_ternarylogic_epi32

_m128i _mm_mask_ternarylogic_epi32(__m128i src, __mmask8 k, _m128i a, _m128i b, int imm8)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpternlogd
Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in imm8. For each bit in each packed 32-bit integer, the corresponding bit from src, a, and b are used to form a 3 bit index into imm8, and the value at that bit in imm8 is written to the corresponding bit in the return value using writemask k at 32-bit granularity (32-bit elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_ternarylogic_epi32

_m128i _mm_maskz_ternarylogic_epi32(__mmask8 k, _m128i a, _m128i b, _m128i c, int imm8)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpternlogd
Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in imm8. For each bit in each packed 32-bit integer, the corresponding bit from a, b, and c are used to form a 3 bit index into imm8, and the value at that bit in imm8 is written to the corresponding bit in the return value using zeromask k at 32-bit granularity (32-bit elements are zeroed out when the corresponding mask bit is not set).

\end{verbatim}
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpxorq
Compute the bitwise XOR of packed 64-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

```c
__m256i _mm256_mask_xor_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpxorq
Compute the bitwise XOR of packed 64-bit integers in a and b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

```c
__m256i _mm256_maskz_xor_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpxorq
Compute the bitwise XOR of packed 64-bit integers in a and b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

### Intrinsics for Miscellaneous Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td>k</td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td>a</td>
<td>first source vector element</td>
</tr>
<tr>
<td>b</td>
<td>second source vector element</td>
</tr>
<tr>
<td>c</td>
<td>third source vector element</td>
</tr>
</tbody>
</table>
| rounding | Rounding control values; these can be one of the following (along with the sae suppress all exceptions flag):
<p>|          | • _MM_FROUND_TO_NEAREST_INT - rounds to nearest even |
|          | • _MM_FROUND_TO_NEG_INF - rounds to negative infinity |
|          | • _MM_FROUND_TO_POS_INF - rounds to positive infinity |
|          | • _MM_FROUND_TO_ZERO - rounds to zero |
|          | • _MM_FROUND_CUR_DIRECTION - rounds using default from MXCSR register |
| interv   | Where _MM_MANTISSA_NORM_ENUM can be one of the following: |</p>
<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>• MM_MANT_NORM_1_2</td>
<td>interval ([1, 2))</td>
</tr>
<tr>
<td>• MM_MANT_NORM_p5_2</td>
<td>interval ([1.5, 2))</td>

<td>• MM_MANT_NORM_p75_1p5</td>
<td>interval ([0.75, 1.5))</td>
</tr>
</tbody>
</table>

Where **MM_MANTISSA_SIGN_ENUM can be one of the following:**

• MM_MANT_SIGN_src - sign = sign(SRC)
• MM_MANT_SIGN_zero - sign = 0
• MM_MANT_SIGN_nan - DEST = NaN if sign(SRC) = 1

### _mm_broadcast_i32x2

```c
__m128i _mm_broadcast_i32x2(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \(a\) to all elements of "dst."

### _mm_mask_broadcast_i32x2

```c
__m128i _mm_mask_broadcast_i32x2(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

### _mm_maskz_broadcast_i32x2

```c
__m128i _mm_maskz_broadcast_i32x2(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

### _mm256_broadcast_i32x2

```c
__m256i _mm256_broadcast_i32x2(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \(a\) to all elements of "dst."

### _mm256_mask_broadcast_i32x2

```c
__m256i _mm256_mask_broadcast_i32x2(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2
Broadcast the lower 2 packed 32-bit integers from \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_{\text{mm256\_maskz\_broadcast\_i32x2}}

\[
_{\text{m512i\_mm512\_broadcast\_i32x2}}(_{\text{m128i\ a}})
\]

CPUID Flags: AVX512DQ
Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \( a \) to all elements of "dst.

\[
_{\text{mm512\_mask\_broadcast\_i32x2}}
\]

\[
_{\text{m512i\_mm512\_mask\_broadcast\_i32x2}}(_{\text{m512i\ src}}, _{\text{mmask16\ k}}, _{\text{m128i\ a}})
\]

CPUID Flags: AVX512DQ
Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
_{\text{mm512\_maskz\_broadcast\_i32x2}}
\]

\[
_{\text{m512i\_mm512\_maskz\_broadcast\_i32x2}}(_{\text{mmask16\ k}}, _{\text{m128i\ a}})
\]

CPUID Flags: AVX512DQ
Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256\_broadcast\_i32x4}}
\]

\[
_{\text{m256i\_mm256\_broadcast\_i32x4}}(_{\text{m128i\ a}})
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vbroadcasti32x4

Broadcast the 4 packed 32-bit integers from \( a \) to all elements of the return value.

\[
_{\text{mm256\_mask\_broadcast\_i32x4}}
\]

\[
_{\text{m256i\_mm256\_mask\_broadcast\_i32x4}}(_{\text{m256i\ src}}, _{\text{mmask8\ k}}, _{\text{m128i\ a}})
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vbroadcasti32x4
Broadcast the 4 packed 32-bit integers from \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{__m256\_mask\_broadcast\_i32x4}
\]
\[
\_m256i\ _m256\_mask\_broadcast\_i32x4(\_mmask8\ k,\ _m128i\ a)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcasti32x4

Broadcast the 4 packed 32-bit integers from \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{__m512\_broadcast\_i32x8}
\]
\[
\_m512i\ _m512\_broadcast\_i32x8(\_m256i\ a)
\]

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x8

Broadcast the 8 packed 32-bit integers from \( a \) to all elements of the return value.

\[
\text{__m512\_mask\_broadcast\_i32x8}
\]
\[
\_m512i\ _m512\_mask\_broadcast\_i32x8(\_m512i\ src,\ _mmask16\ k,\ _m256i\ a)
\]

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x8

Broadcast the 8 packed 32-bit integers from \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\text{__m512\_maskz\_broadcast\_i32x8}
\]
\[
\_m512i\ _m512\_maskz\_broadcast\_i32x8(\_mmask16\ k,\ _m256i\ a)
\]

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x8

Broadcast the 8 packed 32-bit integers from \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{__m256\_broadcast\_i64x2}
\]
\[
\_m256i\ _m256\_broadcast\_i64x2(\_m128i\ a)
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti64x2

Broadcast the 2 packed 64-bit integers from \( a \) to all elements of the return value.

\[
\text{__m256\_mask\_broadcast\_i64x2}
\]
\[
\_m256i\ _m256\_mask\_broadcast\_i64x2(\_m256i\ src,\ _mmask8\ k,\ _m128i\ a)
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti64x2
Broadcast the 2 packed 64-bit integers from $a$ to all elements of the return value using writemask $k$ (elements are copied from $src$ when the corresponding mask bit is not set).

**_mm256_maskz_broadcast_i64x2**

```c
__m256i _mm256_maskz_broadcast_i64x2(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti64x2

Broadcast the 2 packed 64-bit integers from $a$ to all elements of the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

**_mm512_broadcast_i64x2**

```c
__m512i _mm512_broadcast_i64x2(__m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti64x2

Broadcast the 2 packed 64-bit integers from $a$ to all elements of the return value.

**_mm512_mask_broadcast_i64x2**

```c
__m512i _mm512_mask_broadcast_i64x2(__m512i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti64x2

Broadcast the 2 packed 64-bit integers from $a$ to all elements of the return value using writemask $k$ (elements are copied from $src$ when the corresponding mask bit is not set).

**_mm512_maskz_broadcast_i64x2**

```c
__m512i _mm512_maskz_broadcast_i64x2(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti64x2

Broadcast the 2 packed 64-bit integers from $a$ to all elements of the return value using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_inserti32x4**

```c

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

**_mm_maskz_broadcastss_ps_**

\[
\text{\_m128 \_mm_maskz_broadcastss_ps(\_mmask8 k, \_m128 a)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_broadcastss_ps_**

\[
\text{\_m256 \_mm256_mask_broadcastss_ps(\_m256 src, \_mmask8 k, \_m128 a)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

**_mm256_maskz_broadcastss_ps_**

\[
\text{\_m256 \_mm256_maskz_broadcastss_ps(\_mmask8 k, \_m128 a)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm_mask_compress_pd_**

\[
\text{\_m128d \_mm_mask_compress_pd(\_m128d src, \_mmask8 k, \_m128d a)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in \(a\) (those with their respective bit set in writemask \(k\)) to the return value, and pass through the remaining elements from \(src\).

**_mm_maskz_compress_pd_**

\[
\text{\_m128d \_mm_maskz_compress_pd(\_mmask8 k, \_m128d a)}
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in \(a\) (those with their respective bit set in zeromask \(k\)) to the return value, and set the remaining elements to zero.
_mm256_mask_compress_pd

```c
__m256d _mm256_mask_compress_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in `a` (those with their respective bit set in writemask `k`) to the return value, and pass through the remaining elements from `src`.

__mm256_maskz_compress_pd

```c
__m256d _mm256_maskz_compress_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in `a` (those with their respective bit set in zeromask `k`) to the return value, and set the remaining elements to zero.

__mm_mask_compress_ps

```c
__m128 _mm_mask_compress_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in `a` (those with their respective bit set in writemask `k`) to the return value, and pass through the remaining elements from `src`.

__mm_maskz_compress_ps

```c
__m128 _mm_maskz_compress_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in `a` (those with their respective bit set in zeromask `k`) to the return value, and set the remaining elements to zero.

__mm256_mask_compress_ps

```c
__m256 _mm256_mask_compress_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in `a` (those with their respective bit set in writemask `k`) to the return value, and pass through the remaining elements from `src`.

__mm256_maskz_compress_ps

```c
__m256 _mm256_maskz_compress_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in `a` (those with their respective bit set in zeromask `k`) to the return value, and set the remaining elements to zero.
Contiguously store the active single-precision (32-bit) floating-point elements in a (those with their respective bit set in zeromask k) to the return value, and set the remaining elements to zero.

_\texttt{mm\_mask\_expand\_pd}

\[
\_m128d\ \text{mm\_mask\_expand\_pd}(\_m128d\ \text{src},\ \_mmask8\ \text{k},\ \_m128d\ \text{a})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load contiguous active double-precision (64-bit) floating-point elements from a (those with their respective bit set in mask k), and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_\texttt{mm\_maskz\_expand\_pd}

\[

\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load contiguous active single-precision (32-bit) floating-point elements from a (those with their respective bit set in mask k), and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).
_mm_maskz_expand_ps

__m128 _mm_maskz_expand_ps(__mmask8 k, __m128 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load contiguous active single-precision (32-bit) floating-point elements from a (those with their respective bit set in mask k), and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expand_ps

__m256 _mm256_mask_expand_ps(__m256 src, __mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load contiguous active single-precision (32-bit) floating-point elements from a (those with their respective bit set in mask k), and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_expand_ps

__m256 _mm256_maskz_expand_ps(__mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vexpandps
Load contiguous active single-precision (32-bit) floating-point elements from a (those with their respective bit set in mask k), and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_extractf32x4_ps

__m128 _mm256_extractf32x4_ps(__m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vextractf32x4
Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from a, selected with imm, and store the result in the return value.

_mm256_mask_extractf32x4_ps

__m128 _mm256_mask_extractf32x4_ps(__m256 src, __mmask8 k, __m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vextractf32x4
Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from a, selected with imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_extractf32x4_ps

__m128 _mm256_maskz_extractf32x4_ps(__mmask8 k, __m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): `vextractf32x4`

Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from `a`, selected with `imm`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

<code>_mm512_extractf32x8_ps</code>

<code>_m256 _mm512_extractf32x8_ps(__m512 a, int imm)</code>

CPUID Flags: AVX512DQ

Instruction(s): `vextractf32x8`

Extract 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from `a`, selected with `imm`, and store the result in the return value.

<code>_mm512_mask_extractf32x8_ps</code>

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vfixupimmps
Fix up packed single-precision (32-bit) floating-point elements in a and b using packed 32-bit integers in c, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). imm is used to set the required flags reporting.

_mm_getexp_pd

__m128d _mm_getexp_pd(__m128d a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in `a` to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates `floor(log_2(x))` for each element.

```cpp
__m128d _mm_mask_getexp_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in `a` to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). This intrinsic essentially calculates `floor(log_2(x))` for each element.

```cpp
__m128d _mm_maskz_getexp_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in `a` to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates `floor(log_2(x))` for each element.

```cpp
__m256d _mm256_getexp_pd(__m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in `a` to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates `floor(log_2(x))` for each element.

```cpp
__m256d _mm256_mask_getexp_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in `a` to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set). This intrinsic essentially calculates `floor(log_2(x))` for each element.

```cpp
__m256d _mm256_maskz_getexp_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in a to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates \( \text{floor}(\log_2(x)) \) for each element.

__mm_getexp_ps

__m128 __m_getexp_ps(__m128 a)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates \( \text{floor}(\log_2(x)) \) for each element.

__mm_mask_getexp_ps

__m128 __m_mask_getexp_ps(__m128 src, __mmask8 k, __m128 a)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set). This intrinsic essentially calculates \( \text{floor}(\log_2(x)) \) for each element.

__mm_maskz_getexp_ps

__m128 __m_maskz_getexp_ps(__mmask8 k, __m128 a)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates \( \text{floor}(\log_2(x)) \) for each element.

__mm256_getexp_ps

__m256 __m256_getexp_ps(__m256 a)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates \( \text{floor}(\log_2(x)) \) for each element.

__mm256_mask_getexp_ps

__m256 __m256_mask_getexp_ps(__m256 src, __mmask8 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetexpps
Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set). This intrinsic essentially calculates floor(log2(x)) for each element.

_mm256_maskz_getexp_ps

__m256_mm256_maskz_getexp_ps(__m256 k, __m256 a)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps
Convert the exponent of each packed single-precision (32-bit) floating-point element in a to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates floor(log2(x)) for each element.

_mm_getmant_pd

__m128d_mm_getmant_pd(__m128d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantpd
Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results. This intrinsic essentially calculates ±(2^k)*|x.significand|, where k depends on the interval range defined by interv and the sign depends on sc and the source sign.

_mm_mask_getmant_pd

__m128d_mm_mask_getmant_pd(__m256 src, __m256 k, __m256 a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantpd
Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set). This intrinsic essentially calculates ±(2^k)*|x.significand|, where k depends on the interval range defined by interv and the sign depends on sc and the source sign.

_mm_maskz_getmant_pd

__m128d_mm_maskz_getmant_pd(__m256 k, __m128d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantpd
Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates ±(2^k)*|x.significand|, where k depends on the interval range defined by interv and the sign depends on sc and the source sign.
_mm256_getmant_pd

__m256d _mm256_getmant_pd(__m256d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantpd

Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results. This intrinsic essentially calculates $\pm(2^k)|x.significand|$, where $k$ depends on the interval range defined by interv and the sign depends on sc and the source sign.

__m256d _mm256_mask_getmant_pd(__m256d src, __mmask8 k, __m256d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantpd

Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results using writemask $k$ (elements are copied from src when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)|x.significand|$, where $k$ depends on the interval range defined by interv and the sign depends on sc and the source sign.

__m256d _mm256_maskz_getmant_pd(__mmask8 k, __m256d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantpd

Normalize the mantissas of packed double-precision (64-bit) floating-point elements in a, and return the results using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)|x.significand|$, where $k$ depends on the interval range defined by interv and the sign depends on sc and the source sign.

_mm_getmant_ps

__m128 _mm_getmant_ps(__m128 a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in a, and return the results. This intrinsic essentially calculates $\pm(2^k)|x.significand|$, where $k$ depends on the interval range defined by interv and the sign depends on sc and the source sign.

__m128 _mm_mask_getmant_ps(__m128 src, __mmask8 k, __m128 a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in a, and return the results using writemask $k$ (elements are copied from src when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)|x.significand|$, where $k$ depends on the interval range defined by interv and the sign depends on sc and the source sign.
Normalize the mantissas of packed single-precision (32-bit) floating-point elements in \texttt{a}, and return the results using writemask \texttt{k} (elements are copied from \texttt{src} when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)\times|x.|$, where \texttt{k} depends on the interval range defined by \texttt{interv} and the sign depends on \texttt{sc} and the source sign.

\begin{verbatim}
__m128 _mm_maskz_getmant_ps(__mmask8 k, __m128 a, _MM_MANTISSA_NORM_ENUM interv,
                                       _MM_MANTISSA_SIGN_ENUM sc)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps
\end{verbatim}

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in \texttt{a}, and return the results using zeromask \texttt{k} (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)\times|x.|$, where \texttt{k} depends on the interval range defined by \texttt{interv} and the sign depends on \texttt{sc} and the source sign.

\begin{verbatim}
__m256 _mm256_getmant_ps(__m256 a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps
\end{verbatim}

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in \texttt{a}, and return the results. This intrinsic essentially calculates $\pm(2^k)\times|x.|$, where \texttt{k} depends on the interval range defined by \texttt{interv} and the sign depends on \texttt{sc} and the source sign.

\begin{verbatim}
__m256 _mm256_mask_getmant_ps(__m256 src, __mmask8 k, __m256 a, _MM_MANTISSA_NORM_ENUM interv,
                                         _MM_MANTISSA_SIGN_ENUM sc)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps
\end{verbatim}

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in \texttt{a}, and return the results using writemask \texttt{k} (elements are copied from \texttt{src} when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)\times|x.|$, where \texttt{k} depends on the interval range defined by \texttt{interv} and the sign depends on \texttt{sc} and the source sign.

\begin{verbatim}
__m256 _mm256_maskz_getmant_ps(__mmask8 k, __m256 a, _MM_MANTISSA_NORM_ENUM interv,
                                       _MM_MANTISSA_SIGN_ENUM sc)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vgetmantps
\end{verbatim}

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in \texttt{a}, and return the results using zeromask \texttt{k} (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates $\pm(2^k)\times|x.|$, where \texttt{k} depends on the interval range defined by \texttt{interv} and the sign depends on \texttt{sc} and the source sign.

\begin{verbatim}
__m256 _mm256_insertf32x4(__m256 a, __m128 b, int imm)
\end{verbatim}
CPUID Flags: AVX512F, AVX512VL  
Instruction(s): vinsertf32x4

Copy a to the return value, then insert 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from b into dst at the location specified by imm.

**_mm256_mask_insertf32x4**

```
m256 _mm256_mask_insertf32x4(__m256 src, __mmask8 k, __m256 a, __m128 b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in \(a\) using the control in \(imm\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm_maskz_permutevar_ps_**

```c
__m128 _mm_maskz_permutevar_ps(__mmask8 k, __m128 a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in \(a\) using the control in \(b\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_permute_ps_**

```c
__m256 _mm256_mask_permute_ps(__m256 src, __mmask8 k, __m256 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in \(a\) within 128-bit lanes using the control in \(imm\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

**_mm256_mask_permutevar_ps_**

```c
__m256 _mm256_mask_permutevar_ps(__m256 src, __mmask8 k, __m256 a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in \(a\) within 128-bit lanes using the control in \(b\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

**_mm256_maskz_permute_ps_**

```c
__m256 _mm256_maskz_permute_ps(__mmask8 k, __m256 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps
Shuffle single-precision (32-bit) floating-point elements in a within 128-bit lanes using the control in \(imm\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256}} \_\text{maskz_permutevar\_ps}
\]
\[
_{\text{m256}} \_\text{mm256\_maskz\_permutevar\_ps}(\text{__mmask8} \ k, \_{\text{m256}} a, \_{\text{m256i}} b)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in a within 128-bit lanes using the control in \(b\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256}} \_\text{mask\_permutex\_pd}
\]
\[
_{\text{m256d}} \_\text{mm256\_mask\_permutex\_pd}(_{\text{m256d}} \text{src}, \text{__mmask8} k, \_{\text{m256d}} a, \text{int} \text{imm})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in a across lanes using the control in \(imm\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm256}} \_\text{mask\_permutexvar\_pd}
\]
\[
_{\text{m256d}} \_\text{mm256\_mask\_permutexvar\_pd}(_{\text{m256d}} \text{src}, \text{__mmask8} k, \_{\text{m256i}} \text{idx}, \_{\text{m256d}} a)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in a across lanes using the corresponding index in \(idx\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
_{\text{mm256}} \_\text{maskz\_permutex\_pd}

\[
_{\text{m256d}} \_\text{mm256\_maskz\_permutex\_pd}(\text{__mmask8} k, \_{\text{m256d}} a, \text{int} \text{imm})
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in a across lanes using the control in \(imm\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm256}} \_\text{maskz\_permutexvar\_pd}
\]
\[
_{\text{m256d}} \_\text{mm256\_maskz\_permutexvar\_pd}(\text{__mmask8} k, \_{\text{m256i}} \text{idx}, \_{\text{m256d}} a)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in a across lanes using the corresponding index in \(idx\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).
**_mm256_permutex_pd_**

\[ \text{__m256d } \text{_mm256_permutex_pd(__m256d a, int imm)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in \( a \) across lanes using the control in \( imm \), and return the results.

**_mm256_permutexvar_pd_**

\[ \text{__m256d } \text{_mm256_permutexvar_pd(__m256i idx, __m256d a)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in \( a \) across lanes using the corresponding index in \( idx \), and return the results.

**_mm256_mask_permutexvar_ps_**

\[ \text{__m256 } \text{_mm256_mask_permutexvar_ps(__m256 src, __mmask8 k, __m256i idx, __m256 a)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpps

Shuffle single-precision (32-bit) floating-point elements in \( a \) across lanes using the corresponding index in \( idx \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm256_maskz_permutexvar_ps_**

\[ \text{__m256 } \text{_mm256_maskz_permutexvar_ps(__mmask8 k, __m256i idx, __m256 a)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpps

Shuffle single-precision (32-bit) floating-point elements in \( a \) across lanes using the corresponding index in \( idx \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_permutexvar_ps_**

\[ \text{__m256 } \text{_mm256_permutexvar_ps(__m256i idx, __m256 a)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpps

Shuffle single-precision (32-bit) floating-point elements in \( a \) across lanes using the corresponding index in \( idx \).

**_mm_mask_permutex2var_pd_**

\[ \text{__m128d } \text{_mm_mask_permutex2var_pd(__m128d a, __mmask8 k, __m128i idx, __m128d b)} \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2pd
Shuffle double-precision (64-bit) floating-point elements in $a$ and $b$ across lanes using the corresponding selector and index in $idx$, and return the results using writemask $k$ (elements are copied from $a$ when the corresponding mask bit is not set).

$_{\text{mm256}_\text{mask_permutex2varpd}}$

\[
\text{mm256_mask_permutex2var_pd}(\text{m256d } a, \text{mmask8 } k, \text{m256i } idx, \text{m256d } b)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vperm2pd

Shuffle double-precision (64-bit) floating-point elements in $a$ and $b$ across lanes using the corresponding selector and index in $idx$, and return the results using writemask $k$ (elements are copied from $a$ when the corresponding mask bit is not set).

_mm_maskz_range_ss

_m128 _mm_maskz_range_ss(__mmask8 k, __m128 a, __m128 b, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in imm) for the lower single-precision (32-bit) floating-point element in a and b, store the result in the lower element of the return value using zeromask k (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from a to the upper elements of dst.

_mm_range_round_ss

_m128 _mm_range_round_ss(__m128 a, __m128 b, int imm, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in imm) for the lower single-precision (32-bit) floating-point element in a and b, store the result in the lower element of the return value, and copy the upper 3 packed elements from a to the upper elements of dst.
_mm_mask_reduce_pd

_mm_mask_reduce_pd(_m128d src, __mmask8 k, _m128d a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_reduce_pd

_mm_maskz_reduce_pd(__mmask8 k, _m128d a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_reduce_pd

_mm_reduce_pd(_m128d a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by imm, and return the results.

_mm256_mask_reduce_pd

_mm256_mask_reduce_pd(_m256d src, __mmask8 k, _m256d a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_reduce_pd

_mm256_maskz_reduce_pd(__mmask8 k, _m256d a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_reduce_pd

_mm256_reduce_pd(_m256d a, int imm)
CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by \(imm\), and return the results.

__mm512_mask_reduce_pd

\[
\_mm512\_mask\_reduce\_pd(_m512d\ src,\ _mmask8\ k,\ _m512d\ a,\ int\ imm)
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by \(imm\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

__mm512_mask_reduce_round_pd

\[
\_mm512\_mask\_reduce\_round\_pd(_m512d\ src,\ _mmask8\ k,\ _m512d\ a,\ int\ imm,\ int\ rounding)
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by \(imm\), and return the results using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

__mm512_maskz_reduce_pd

\[
\_mm512\_maskz\_reduce\_pd(_mmask8\ k,\ _m512d\ a,\ int\ imm)
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by \(imm\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

__mm512_maskz_reduce_round_pd

\[
\_mm512\_maskz\_reduce\_round\_pd(_mmask8\ k,\ _m512d\ a,\ int\ imm,\ int\ rounding)
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in a by the number of bits specified by \(imm\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

__mm512_reduce_pd

\[
\_mm512\_reduce\_pd(_m512d\ a,\ int\ imm)
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd
Extract the reduced argument of packed double-precision (64-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results.

\_mm512\_reduce\_round\_pd

\[
\texttt{\_m512d \_mm512\_reduce\_round\_pd(\_m512d a, int imm, int rounding)}
\]

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results.

\_mm\_mask\_reduce\_ps

\[
\texttt{\_m128 \_mm\_mask\_reduce\_ps(\_m128 src, __mmask8 k, __m128 a, int imm)}
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\_mm\_maskz\_reduce\_ps

\[
\texttt{\_m128 \_mm\_maskz\_reduce\_ps(__mmask8 k, __m128 a, int imm)}
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\_mm\_reduce\_ps

\[
\texttt{\_m128 \_mm\_reduce\_ps(__m128 a, int imm)}
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results.

\_mm256\_mask\_reduce\_ps

\[
\texttt{\_m256 \_mm256\_mask\_reduce\_ps(\_m256 src, __mmask8 k, _m256 a, int imm)}
\]

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).
_mm256_maskz_reduce_ps

__m256 __m256_maskz_reduce_ps(__mmask8 k, __m256 a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

__m256_reduce_ps

__m256 __m256_reduce_ps(__m256 a, int imm)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results.

__m512_mask_reduce_ps

__m512 __m512_mask_reduce_ps(__m512 src, __mmask16 k, __m512 a, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

__m512_mask_reduce_round_ps

__m512 __m512_mask_reduce_round_ps(__m512 src, __mmask16 k, __m512 a, int imm, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

__m512_maskz_reduce_ps

__m512 __m512_maskz_reduce_ps(__mmask16 k, __m512 a, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in \( a \) by the number of bits specified by \( imm \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

__m512_maskz_reduce_round_ps

__m512 __m512_maskz_reduce_round_ps(__mmask16 k, __m512 a, int imm, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): vreduceps
Extract the reduced argument of packed single-precision (32-bit) floating-point elements in a by the number of bits specified by imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512_reduce_ps

__m512 __m512_reduce_ps(__m512 a, int imm)

CPUID Flags: AVX512DQ

Instruction(s): vreduceps
Extract the reduced argument of packed single-precision (32-bit) floating-point elements in a by the number of bits specified by imm, and return the results.

_mm512_reduce_round_ps

__m512 __m512_reduce_round_ps(__m512 a, int imm, int rounding)

CPUID Flags: AVX512DQ

Instruction(s): vreduceps
Extract the reduced argument of packed single-precision (32-bit) floating-point elements in a by the number of bits specified by imm, and return the results.

_mm_mask_reduce_round_sd

__m128d __m128d_reduce_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm, int rounding)

CPUID Flags: AVX512DQ

Instruction(s): vreducesd
Extract the reduced argument of the lower double-precision (64-bit) floating-point element in a by the number of bits specified by imm, store the result in the lower element of the return value using writemask k (the element is copied from src when mask bit 0 is not set), and copy the upper element from b to the upper element of dst.

_mm_mask_redcse_sd

__m128d __m128d_reduce_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm)

CPUID Flags: AVX512DQ

Instruction(s): vreducesd
Extract the reduced argument of the lower double-precision (64-bit) floating-point element in a by the number of bits specified by imm, store the result in the lower element of the return value using writemask k (the element is copied from src when mask bit 0 is not set), and copy the upper element from b to the upper element of dst.

_mm_maskz_reduce_round_sd

__m128d __m128d_reduce_round_sd(__mmask8 k, __m128d a, __m128d b, int imm, int rounding)

CPUID Flags: AVX512DQ

Instruction(s): vreducesd
Extract the reduced argument of the lower double-precision (64-bit) floating-point element in \(a\) by the number of bits specified by \(imm\), store the result in the lower element of the return value using zeromask \(k\) (the element is zeroed out when mask bit 0 is not set), and copy the upper element from \(b\) to the upper element of \(dst\).

\_mm\_maskz\_reduce\_sd

\_m128d \_mm\_maskz\_reduce\_sd(\_mmask8 k, \_m128d a, \_m128d b, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in \(a\) by the number of bits specified by \(imm\), store the result in the lower element of the return value using zeromask \(k\) (the element is zeroed out when mask bit 0 is not set), and copy the upper element from \(b\) to the upper element of \(dst\).

\_mm\_reduce\_round\_sd

\_m128d \_mm\_reduce\_round\_sd(\_m128d a, \_m128d b, int imm, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in \(a\) by the number of bits specified by \(imm\), store the result in the lower element of the return value, and copy the upper element from \(b\) to the upper element of \(dst\).

\_mm\_reduce\_sd

\_m128d \_mm\_reduce\_sd(\_m128d a, \_m128d b, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in \(a\) by the number of bits specified by \(imm\), store the result in the lower element of the return value, and copy the upper element from \(b\) to the upper element of \(dst\).

\_mm\_mask\_reduce\_round\_ss

\_m128 \_mm\_mask\_reduce\_round\_ss(\_m128 src, \_mmask8 k, \_m128 a, \_m128 b, int imm, int rounding)

CPUID Flags: AVX512DQ
Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \(a\) by the number of bits specified by \(imm\), store the result in the lower element of the return value using writemask \(k\) (the element is copied from \(src\) when mask bit 0 is not set), and copy the upper 3 packed elements from \(b\) to the upper elements of \(dst\).

\_mm\_mask\_reduce\_ss

\_m128 \_mm\_mask\_reduce\_ss(\_m128 src, \_mmask8 k, \_m128 a, \_m128 b, int imm)

CPUID Flags: AVX512DQ
Instruction(s): vreducess
Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \( a \) by the number of bits specified by \( \text{imm} \), store the result in the lower element of the return value using writemask \( k \) (the element is copied from \( \text{src} \) when mask bit 0 is not set), and copy the upper 3 packed elements from \( b \) to the upper elements of \( \text{dst} \).

\[ \_\text{mm\_maskz\_reduce\_round\_ss} \]
\[ \_\text{mm\_maskz\_reduce\_ss}(\_\text{mm\_mask} k, \_\text{m128} a, \_\text{m128} b, \text{int imm}, \text{int rounding}) \]

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \( a \) by the number of bits specified by \( \text{imm} \), store the result in the lower element of the return value using zeromask \( k \) (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from \( b \) to the upper elements of \( \text{dst} \).

\[ \_\text{mm\_maskz\_reduce\_ss} \]
\[ \_\text{mm\_maskz\_reduce\_ss}(\_\text{mm\_mask} k, \_\text{m128} a, \_\text{m128} b, \text{int imm}) \]

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \( a \) by the number of bits specified by \( \text{imm} \), store the result in the lower element of the return value, and copy the upper 3 packed elements from \( b \) to the upper elements of \( \text{dst} \).

\[ \_\text{mm\_reduce\_round\_ss} \]
\[ \_\text{mm\_reduce\_round\_ss}(\_\text{m128} a, \_\text{m128} b, \text{int imm}, \text{int rounding}) \]

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \( a \) by the number of bits specified by \( \text{imm} \), store the result in the lower element of the return value, and copy the upper 3 packed elements from \( b \) to the upper elements of \( \text{dst} \).

\[ \_\text{mm\_reduce\_ss} \]
\[ \_\text{mm\_reduce\_ss}(\_\text{m128} a, \_\text{m128} b, \text{int imm}) \]

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in \( a \) by the number of bits specified by \( \text{imm} \), store the result in the lower element of the return value, and copy the upper 3 packed elements from \( b \) to the upper elements of \( \text{dst} \).

\[ \_\text{mm\_mask\_roundscale\_pd} \]
\[ \_\text{mm\_mask\_roundscale\_pd}(\_\text{m128d src}, \_\text{mm\_mask} k, \_\text{m128d} a, \text{int imm}) \]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd
Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```
_mm_maskz_roundscale_pd

__m128d _mm_maskz_roundscale_pd(__mmask8 k, __m128d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```
_mm_roundscale_pd

__m128d _mm_roundscale_pd(__m128d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results.

```
_mm256_mask_roundscale_pd

__m256d _mm256_mask_roundscale_pd(__m256d src, __mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```
_mm256_maskz_roundscale_pd

__m256d _mm256_maskz_roundscale_pd(__mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```
_mm256_roundscale_pd

__m256d _mm256_roundscale_pd(__m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in `a` to the number of fraction bits specified by `imm`, and return the results.
__mm_mask_roundscale_ps

__m128 __mm_mask_roundscale_ps(__m128 src, __mmask8 k, __m128 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in a to the number of fraction bits specified by imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm_maskz_roundscale_ps

__m128 __mm_maskz_roundscale_ps(__mmask8 k, __m128 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in a to the number of fraction bits specified by imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm_roundscale_ps

__m128 __mm_roundscale_ps(__m128 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in a to the number of fraction bits specified by imm, and return the results.

__mm256_mask_roundscale_ps

__m256 __mm256_mask_roundscale_ps(__m256 src, __mmask8 k, __m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in a to the number of fraction bits specified by imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

__mm256_maskz_roundscale_ps

__m256 __mm256_maskz_roundscale_ps(__mmask8 k, __m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in a to the number of fraction bits specified by imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

__mm256_roundscale_ps

__m256 __mm256_roundscale_ps(__m256 a, int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vrndscaleps
Round packed single-precision (32-bit) floating-point elements in \( a \) to the number of fraction bits specified by \( \text{imm} \), and return the results.

\[
\_\text{mm\_mask\_scalef\_pd}
\]

\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vscalefps
Scale the packed single-precision (32-bit) floating-point elements in \( a \) using values from \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\_mm256\_maskz\_scalef\_ps
\]

\[
\text{\_m256 } \_mm256\_maskz\_scalef\_ps(\text{\_mmask8 k, \_m256 a, \_m256 b})
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vscalefps
Scale the packed single-precision (32-bit) floating-point elements in \( a \) using values from \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).
**_mm256_scalef_ps**

```c
__m256 _mm256_scalef_ps(__m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in `a` using values from `b`, and return the results.

**_mm256_mask_shuffle_f32x4**

```c
__m256 _mm256_mask_shuffle_f32x4(__m256 src, __mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by `imm` from `a` and `b`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm256_maskz_shuffle_f32x4**

```c
__m256 _mm256_maskz_shuffle_f32x4(__mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by `imm` from `a` and `b`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_shuffle_f32x4**

```c
__m256 _mm256_shuffle_f32x4(__m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by `imm` from `a` and `b`, and return the results.

**_mm256_mask_shuffle_f64x2**

```c

\]

CPUID Flags: AVX512BW

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in \( a \) compared to those in \( b \), and store the 16-bit results in the return value.
Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in \textit{a} compared to those in \textit{b}, and store the 16-bit results in the return value using writemask \textit{k} (elements are copied from \textit{src} when the corresponding mask bit is not set).

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in \textit{a} compared to those in \textit{b}, and store the 16-bit results in the return value using zeromask \textit{k} (elements are zeroed out when the corresponding mask bit is not set).

Extract 128 bits (composed of 4 packed 32-bit integers) from \textit{a}, selected with \textit{imm}, and store the result in the return value.

Extract 128 bits (composed of 4 packed 32-bit integers) from \textit{a}, selected with \textit{imm}, and return the results using writemask \textit{k} (elements are copied from \textit{src} when the corresponding mask bit is not set).

Extract 128 bits (composed of 4 packed 32-bit integers) from \textit{a}, selected with \textit{imm}, and return the results using zeromask \textit{k} (elements are zeroed out when the corresponding mask bit is not set).

Extract 128 bits (composed of 4 packed 32-bit integers) from \textit{a}, selected with \textit{imm}, and store the result in the return value.
Extract 256 bits (composed of 8 packed 32-bit integers) from a, selected with imm, and store the result in the return value.

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovm2b
Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm256_movm_epi8

__m256i _mm256_movm_epi8(__mmask32 k)

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpmovm2b
Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm512_movm_epi8

__m512i _mm512_movm_epi8(__mmask64 k)

CPUID Flags: AVX512BW
Instruction(s): vpmovm2b
Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm_movm_epi32

__m128i _mm_movm_epi32(__mmask8 k)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vpmovm2d
Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm256_movm_epi32

__m256i _mm256_movm_epi32(__mmask8 k)

CPUID Flags: AVX512DQ, AVX512VL
Instruction(s): vpmovm2d
Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm512_movm_epi32

__m512i _mm512_movm_epi32(__mmask16 k)

CPUID Flags: AVX512DQ
Instruction(s): vpmovm2d
Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.
_mm_movm_epi64

__m128i _mm_movm_epi64(__mmask8 k)

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm256_movm_epi64

__m256i _mm256_movm_epi64(__mmask8 k)

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm512_movm_epi64

__m512i _mm512_movm_epi64(__mmask8 k)

CPUID Flags: AVX512DQ

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm_movm_epi16

__m128i _mm_movm_epi16(__mmask8 k)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2w

Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm256_movm_epi16

__m256i _mm256_movm_epi16(__mmask16 k)

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2w

Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in k.

_mm512_movm_epi16

__m512i _mm512_movm_epi16(__mmask32 k)

CPUID Flags: AVX512BW

Instruction(s): vpmovm2w
Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in \( k \).

\[ \text{_mm512_sad_epu8} \]

\[
\_m512i \_mm512_{\text{sad epu8}}(\_m512i \, a, \_m512i \, b)
\]

CPUID Flags: AVX512BW

Instruction(s): vpsadbw

Compute the absolute differences of packed unsigned 8-bit integers in \( a \) and \( b \), then horizontally sum each consecutive 8 differences to produce four unsigned 16-bit integers, and pack these unsigned 16-bit integers in the low 16 bits of 64-bit elements in the return value.

\[ \text{_mm_mask_shuffle_epi8} \]

\[
\_m128i \_mm_{\text{mask shuffle epi8}}(\_m128i \, \text{src}, \_\text{mmask16} \, k, \_m128i \, a, \_m128i \, b)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufb

Shuffle packed 8-bit integers in \( a \) according to shuffle control mask in the corresponding 8-bit element of \( b \), and return the results using writemask \( k \) (elements are copied from \( \text{src} \) when the corresponding mask bit is not set).

\[ \text{_mm_maskz_shuffle_epi8} \]

Instruction(s): vpermb
Shuffle 8-bit integers in \( a \) across lanes using the corresponding index in \( idx \), and return the result using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \_mm256\_maskz\_permutexvar\_epi8 \]
\[ \_m256i \_mm256\_maskz\_permutexvar\_epi8(\_mmask32 \ k, \_m256i \ idx, \_m256i \ a) \]

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb
Shuffle 8-bit integers in \( a \) and \( b \) across lanes using the corresponding selector and index in \( idx \), and return the result.

\[ \_mm512\_permutexvar\_epi8 \]
\[ \_m512i \_mm512\_permutexvar\_epi8(\_m512i \ idx, \_m512i \ a) \]

CPUID Flags: AVX512VBMI

Instruction(s): vpermb
Shuffle 8-bit integers in \( a \) and \( b \) across lanes using the corresponding selector and index in \( idx \), and return the result using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \_mm512\_mask\_permutexvar\_epi8 \]
\[ \_m512i \_mm512\_mask\_permutexvar\_epi8(\_m512i \ src, \_mmask64 \ k, \_m512i \ idx, \_m512i \ a) \]

CPUID Flags: AVX512VBMI

Instruction(s): vpermb
Shuffle 8-bit integers in \( a \) across lanes using the corresponding index in \( idx \), and return the result using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[ \_mm512\_maskz\_permutexvar\_epi8 \]
\[ \_m512i \_mm512\_maskz\_permutexvar\_epi8(\_mmask64 \ k, \_m512i \ idx, \_m512i \ a) \]

CPUID Flags: AVX512VBMI
Instruction(s): vpermb
Shuffle 8-bit integers in a across lanes using the corresponding index in idx, and return the result using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_epi8

_m128i _mm_permutex2var_epi8(_m128i a, _m128i idx, _m128i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b
Shuffle 8-bit integers in a and b across lanes using the corresponding index in idx, and return the result.

_mm_mask_permutex2var_epi8

_m128i _mm_mask_permutex2var_epi8(_m128i a, __mmask16 k, _m128i idx, _m128i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b
Shuffle 8-bit integers in a and b using the corresponding index in idx, and return the result using writemask k (elements are copied from a when the corresponding mask bit is not set).

_mm_mask2_permutex2var_epi8

_m128i _mm_mask2_permutex2var_epi8(_m128i a, _m128i idx, __mmask16 k, _m128i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b
Shuffle 8-bit integers in a and b using the corresponding index in idx, and return the result using writemask k (elements are copied from idx when the corresponding mask bit is not set).

_mm_maskz_permutex2var_epi8

_m128i _mm_maskz_permutex2var_epi8(__mmask16 k, _m128i a, _m128i idx, _m128i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b, vpermt2b
Shuffle 8-bit integers in a and b using the corresponding index in idx, and return the result using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_epi8

_m256i _mm256_permutex2var_epi8(_m256i a, _m256i idx, _m256i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b
Shuffle 8-bit integers in a and b across lanes using the corresponding index in idx, and return the result.

_mm256_mask_permutex2var_epi8

_m256i _mm256_mask_permutex2var_epi8(_m256i a, __mmask32 k, _m256i idx, _m256i b)

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermt2b
Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result using writemask \(k\) (elements are copied from \(a\) when the corresponding mask bit is not set).

```c
__mm256_mask2_permutex2var_epi8

__m256i_mm256_mask2_permutex2var_epi8(__m256i a, __m256i idx, __mmask32 k, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpermi2b

Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result using writemask \(k\) (elements are copied from \(idx\) when the corresponding mask bit is not set).

```c
__mm256_maskz_permutex2var_epi8

__m256i_mm256_maskz_permutex2var_epi8(__mmask32 k, __m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL
Instruction(s): vpermi2b, vpermt2b

Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm512_permutex2var_epi8

__m512i_mm512_permutex2var_epi8(__m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI
Instruction(s): vpermi2b

Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result.

```c
__mm512_mask_permutex2var_epi8

__m512i_mm512_mask_permutex2var_epi8(__m512i a, __mmask64 k, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI
Instruction(s): vpermt2b

Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result using writemask \(k\) (elements are copied from \(a\) when the corresponding mask bit is not set).

```c
__mm512_mask2_permutex2var_epi8

__m512i_mm512_mask2_permutex2var_epi8(__m512i a, __m512i idx, __mmask64 k, __m512i b)
```

CPUID Flags: AVX512VBMI
Instruction(s): vpermi2b

Shuffle 8-bit integers in \(a\) and \(b\) across lanes using the corresponding index in \(idx\), and return the result using writemask \(k\) (elements are copied from \(idx\) when the corresponding mask bit is not set).

```c
__mm512_maskz_permutex2var_epi8

__m512i_mm512_maskz_permutex2var_epi8(__mmask64 k, __m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI
Instruction(s): vpermi2b, vpermt2b
Shuffle 8-bit integers in \( a \) and \( b \) across lanes using the corresponding index in \( idx \), and return the result using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

### Intrinsics for Move Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>src</code></td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td><code>k</code></td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td><code>a</code></td>
<td>first source vector element</td>
</tr>
</tbody>
</table>

**_mm_mask_mov_pd***

```c
__m128d _mm_mask_mov_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovapd`

Move packed double-precision (64-bit) floating-point elements from \( a \) to the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm_maskz_mov_pd***

```c
__m128d _mm_maskz_mov_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovapd`

Move packed double-precision (64-bit) floating-point elements from \( a \) into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_mov_pd***

```c
__m256d _mm256_mask_mov_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovapd`

Move packed double-precision (64-bit) floating-point elements from \( a \) to the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

**_mm256_maskz_mov_pd***

```c
__m256d _mm256_maskz_mov_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovapd`

Move packed double-precision (64-bit) floating-point elements from \( a \) into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).
Move packed double-precision (64-bit) floating-point elements from \( a \) into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
 \texttt{\_mm\_mask\_mov\_ps}
\]

\[
 \texttt{\_m128 \_mm\_mask\_mov\_ps(\_m128 \texttt{src}, \_mm\_mask8 \texttt{k}, \_m128 \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from \( a \) to the return value using writemask \( k \) (elements are copied from \( \texttt{src} \) when the corresponding mask bit is not set).

\[
 \texttt{\_mm\_maskz\_mov\_ps}
\]

\[
 \texttt{\_m128 \_mm\_maskz\_mov\_ps(\_mm\_mask8 \texttt{k}, \_m128 \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from \( a \) into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
 \texttt{\_mm256\_mask\_mov\_ps}
\]

\[
 \texttt{\_m256 \_mm256\_mask\_mov\_ps(\_m256 \texttt{src}, \_mm\_mask8 \texttt{k}, \_m256 \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from \( a \) to the return value using writemask \( k \) (elements are copied from \( \texttt{src} \) when the corresponding mask bit is not set).

\[
 \texttt{\_mm256\_maskz\_mov\_ps}
\]

\[
 \texttt{\_m256 \_mm256\_maskz\_mov\_ps(\_mm\_mask8 \texttt{k}, \_m256 \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from \( a \) into the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
 \texttt{\_mm\_mask\_movedup\_pd}
\]

\[
 \texttt{\_m128d \_mm\_mask\_movedup\_pd(\_m128d \texttt{src}, \_mm\_mask8 \texttt{k}, \_m128d \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vmov/ddup

Duplicate even-indexed double-precision (64-bit) floating-point elements from \( a \), and return the results using writemask \( k \) (elements are copied from \( \texttt{src} \) when the corresponding mask bit is not set).

\[
 \texttt{\_mm\_maskz\_movedup\_pd}
\]

\[
 \texttt{\_m128d \_mm\_maskz\_movedup\_pd(\_mm\_mask8 \texttt{k}, \_m128d \texttt{a})}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): `vmovddup`
Duplicate even-indexed double-precision (64-bit) floating-point elements from `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```
_mm256_mask_movedup_pd
__m256d _mm256_mask_movedup_pd(__m256d src, __mmask8 k, __m256d a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovddup`
Duplicate even-indexed double-precision (64-bit) floating-point elements from `a`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```
_mm256_maskz_movedup_pd
__m256d _mm256_maskz_movedup_pd(__mmask8 k, __m256d a)
```
CPUID Flags: AVX512F, AVX512VL

Instruction(s): `vmovddup`
Duplicate even-indexed double-precision (64-bit) floating-point elements from `a`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```
_mm_mask_movehdup_ps

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastb

Broadcast 8-bit integer \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\text{_mm_maskz_set1_epi8} \\
\text{__m128i _mm_maskz_set1_epi8(__mmask16 k, char a)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastb

Broadcast 8-bit integer \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
\text{_mm256_mask_set1_epi8} \\
\text{__m256i _mm256_mask_set1_epi8(__m256i src, __mmask32 k, char a)}
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastb
Broadcast 8-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\_\text{mm256\_mask\_set1\_epi8}
\]

\[
\text{\_m256i} \: \_\text{mm256\_mask\_set1\_epi8}(\_\text{mmask32} \: k, \text{char} \: a)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast 8-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\_\text{mm512\_mask\_set1\_epi8}
\]

\[
\text{\_m512i} \: \_\text{mm512\_mask\_set1\_epi8}(\_\text{mmask64} \: k, \text{char} \: a)
\]

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast 8-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\_\text{mm512\_maskz\_set1\_epi8}
\]

\[
\text{\_m512i} \: \_\text{mm512\_maskz\_set1\_epi8}(\_\text{mmask64} \: k, \text{char} \: a)
\]

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast 8-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\_\text{mm\_mask\_set1\_epi32}
\]

\[
\text{\_m128i} \: \_\text{mm\_mask\_set1\_epi32}(\_\text{m128i} \: \text{src}, \_\text{mmask8} \: k, \text{int} \: a)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\_\text{mm\_maskz\_set1\_epi32}
\]

\[
\text{\_m128i} \: \_\text{mm\_maskz\_set1\_epi32}(\_\text{mmask8} \: k, \text{int} \: a)
\]

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\_\text{mm256\_mask\_set1\_epi32}
\]

\[
\text{\_m256i} \: \_\text{mm256\_mask\_set1\_epi32}(\_\text{m256i} \: \text{src}, \_\text{mmask8} \: k, \text{int} \: a)
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpbroadcastd
Broadcast 32-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from src when the corresponding mask bit is not set).

```c
__mm256_maskz_set1_epi32
_m256i __mm256_maskz_set1_epi32(__mmask8 k, int a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd
Broadcast 32-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm_mask_set1_epi64
_m128i __mm_mask_set1_epi64(__m128i src, __mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq
Broadcast 64-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from src when the corresponding mask bit is not set).

```c
__mm_maskz_set1_epi64
_m128i __mm_maskz_set1_epi64(__mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq
Broadcast 64-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm256_mask_set1_epi64
_m256i __mm256_mask_set1_epi64(__m256i src, __mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq
Broadcast 64-bit integer \( a \) to all elements of the return value using writemask \( k \) (elements are copied from src when the corresponding mask bit is not set).

```c
__mm256_maskz_set1_epi64
_m256i __mm256_maskz_set1_epi64(__mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq
Broadcast 64-bit integer \( a \) to all elements of the return value using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

```c
__mm_mask_set1_epi16
_m128i __mm_mask_set1_epi16(__m128i src, __mmask8 k, short a)
```
CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\_
m\_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16
\]
\[
\_m128i \_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16(\_m\_m\_a\_s\_k\_8 \_k, \_s\_h\_r\_o\_a\_r\_t\_ \_a)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
\_
m\_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16
\]
\[
\_m256i \_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16(\_m256i \_s\_r\_c\_r, \_m\_m\_a\_s\_k\_16 \_k, \_s\_h\_r\_o\_a\_r\_t\_ \_a)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\_
m\_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16
\]
\[
\_m256i \_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16(\_m\_m\_a\_s\_k\_16 \_k, \_s\_h\_r\_o\_a\_r\_t\_ \_a)
\]

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[
\_
m\_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16
\]
\[
\_m512i \_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16(\_m512i \_s\_r\_c\_r, \_m\_m\_a\_s\_k\_32 \_k, \_s\_h\_r\_o\_a\_r\_t\_ \_a)
\]

CPUID Flags: AVX512BW
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using writemask \(k\) (elements are copied from \(src\) when the corresponding mask bit is not set).

\[
\_
m\_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16
\]
\[
\_m512i \_m\_m\_a\_s\_k\_z\_s\_e\_t\_1\_e\_p\_i\_16(\_m\_m\_a\_s\_k\_32 \_k, \_s\_h\_r\_o\_a\_r\_t\_ \_a)
\]

CPUID Flags: AVX512BW
Instruction(s): vpbroadcastw
Broadcast the low packed 16-bit integer from \(a\) to all elements of the return value using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).
**Intrinsics for Shift Operations**

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `immintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```c
#include <immintrin.h>
```

<table>
<thead>
<tr>
<th>variable</th>
<th>definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>source element to use based on writemask result</td>
</tr>
<tr>
<td>k</td>
<td>writemask used as a selector</td>
</tr>
<tr>
<td>a</td>
<td>first source vector element</td>
</tr>
<tr>
<td>b</td>
<td>second source vector element</td>
</tr>
</tbody>
</table>

**_mm_mask_rol_epi32**

```c
__m128i _mm_mask_rol_epi32(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in `a` to the left by the number of bits specified in `imm`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm_maskz_rol_epi32**

```c
__m128i _mm_maskz_rol_epi32(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in `a` to the left by the number of bits specified in `imm`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm_rol_epi32**

```c
__m128i _mm_rol_epi32(__m128i a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in `a` to the left by the number of bits specified in `imm`, and return the results.

**_mm256_mask_rol_epi32**

```c
__m256i _mm256_mask_rol_epi32(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold
Rotate the bits in each packed 32-bit integer in $a$ to the left by the number of bits specified in $imm$, and return the results using writemask $k$ (elements are copied from $src$ when the corresponding mask bit is not set).

```cpp
_mm256_maskz_rol_epi32
__m256i _mm256_maskz_rol_epi32(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in $a$ to the left by the number of bits specified in $imm$, and return the results using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

```cpp
_mm256_rol_epi32
__m256i _mm256_rol_epi32(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprold

Rotate the bits in each packed 64-bit integer in $a$ to the left by the number of bits specified in $imm$, and return the results using writemask $k$ (elements are copied from $src$ when the corresponding mask bit is not set).

```cpp
_mm_mask_rol_epi64
__m128i _mm_mask_rol_epi64(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in $a$ to the left by the number of bits specified in $imm$, and return the results using zeromask $k$ (elements are zeroed out when the corresponding mask bit is not set).

```cpp
_mm_maskz_rol_epi64
__m128i _mm_maskz_rol_epi64(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in $a$ to the left by the number of bits specified in $imm$, and return the results.

```cpp
_mm256_mask_rol_epi64
__m256i _mm256_mask_rol_epi64(__m256i src, __mmask8 k, __m256i a, const int imm)
```
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolq
Rotate the bits in each packed 64-bit integer in a to the left by the number of bits specified in imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_rol_epi64

_mm256_maskz_rol_epi64(__m256i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolq
Rotate the bits in each packed 64-bit integer in a to the left by the number of bits specified in imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rol_epi64

_mm256_rol_epi64(__m256i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolq
Rotate the bits in each packed 64-bit integer in a to the left by the number of bits specified in imm, and return the results.

_mm_mask_rolv_epi32

_mm_mask_rolv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolvd
Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_rolv_epi32

_mm_maskz_rolv_epi32(__mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolvd
Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_rolv_epi32

_mm_rolv_epi32(__m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolvd
Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results.
_mm256_mask_rolv_epi32

__m256i _mm256_mask_rolv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_rolv_epi32

__m256i _mm256_maskz_rolv_epi32(__mmask8 k, __m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rolv_epi32

__m256i _mm256_rolv_epi32(__m256i a, __m256i b)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results.

_mm_mask_rolv_epi64

__m128i _mm_mask_rolv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_rolv_epi64

__m128i _mm_maskz_rolv_epi64(__mmask8 k, __m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in a to the left by the number of bits specified in the corresponding element of b, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_rolv_epi64

__m128i _mm_rolv_epi64(__m128i a, __m128i b)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in `a` to the left by the number of bits specified in the corresponding element of `b`, and return the results.

```c
__m256i __m256_mask_rolv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in `a` to the left by the number of bits specified in the corresponding element of `b`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
__m256i __m256_maskz_rolv_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in `a` to the left by the number of bits specified in the corresponding element of `b`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
__m256i __m256_rolv_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in `a` to the right by the number of bits specified in `imm`, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
__m128i __m_mask_ror_epi32(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in `a` to the right by the number of bits specified in `imm`, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
__m128i __m_maskz_ror_epi32(__mmask8 k, __m128i a, const int imm)
```
_mm_ror_epi32

__m128i _mm_ror_epi32(__m128i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in a to the right by the number of bits specified in imm, and return the results.

_mm256_mask_ror_epi32

__m256i _mm256_mask_ror_epi32(__m256i src, __mmask8 k, __m256i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in a to the right by the number of bits specified in imm, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_maskz_ror_epi32

__m256i _mm256_maskz_ror_epi32(__mmask8 k, __m256i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in a to the right by the number of bits specified in imm, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_ror_epi32

__m256i _mm256_ror_epi32(__m256i a, const int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in a to the right by the number of bits specified in imm, and return the results.

\[ \_m128\_mm\_256\_maskz\_rorv\_epi32(\_mmask8 k, \_m128 a, \_m128 b) \]
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvd
Rotate the bits in each packed 32-bit integer in \(a\) to the right by the number of bits specified in the corresponding element of \(b\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[\_\text{mm\_rorv\_epi32}\]
\[\_\text{m128i } \_\text{mm\_rorv\_epi32}(\_\text{m128i } a, \_\text{m128i } b)\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvd
Rotate the bits in each packed 32-bit integer in \(a\) to the right by the number of bits specified in the corresponding element of \(b\), and return the results.

\[\_\text{mm256\_mask\_rorv\_epi32}\]
\[\_\text{m256i } \_\text{mm256\_mask\_rorv\_epi32}(\_\text{m256i } \text{src}, \_\text{mmask8 } k, \_\text{m256i } a, \_\text{m256i } b)\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvd
Rotate the bits in each packed 32-bit integer in \(a\) to the right by the number of bits specified in the corresponding element of \(b\), and return the results using writemask \(k\) (elements are copied from \(\text{src}\) when the corresponding mask bit is not set).

\[\_\text{mm256\_maskz\_rorv\_epi32}\]
\[\_\text{m256i } \_\text{mm256\_maskz\_rorv\_epi32}(\_\text{mmask8 } k, \_\text{m256i } a, \_\text{m256i } b)\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvd
Rotate the bits in each packed 32-bit integer in \(a\) to the right by the number of bits specified in the corresponding element of \(b\), and return the results using zeromask \(k\) (elements are zeroed out when the corresponding mask bit is not set).

\[\_\text{mm256\_rorv\_epi32}\]
\[\_\text{m256i } \_\text{mm256\_rorv\_epi32}(\_\text{m256i } a, \_\text{m256i } b)\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvd
Rotate the bits in each packed 32-bit integer in \(a\) to the right by the number of bits specified in the corresponding element of \(b\), and return the results.

\[\_\text{mm\_mask\_rorv\_epi64}\]
\[\_\text{mm128i } \_\text{mm\_mask\_rorv\_epi64}(\_\text{mm128i } \text{src}, \_\text{mmask8 } k, \_\text{mm128i } a, \_\text{mm128i } b)\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvq
Rotate the bits in each packed 64-bit integer in \( a \) to the right by the number of bits specified in the corresponding element of \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[
\texttt{\_mm\_maskz\_rorv\_epi64}
\]

\[
\texttt{\_m128i \_mm\_maskz\_rorv\_epi64(__m8\ k, \_m128i \ a, \_m128i \ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in \( a \) to the right by the number of bits specified in the corresponding element of \( b \), and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
\texttt{\_mm\_rorv\_epi64}
\]

\[
\texttt{\_m128i \_mm\_rorv\_epi64(_m128i \ a, \_m128i \ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in \( a \) to the right by the number of bits specified in the corresponding element of \( b \), and return the results.

\[
\texttt{\_mm256\_mask\_rorv\_epi64}
\]

\[
\texttt{\_m256i \_mm256\_mask\_rorv\_epi64(_m256i \ src, \_m128i \ k, \_m256i \ a, \_m256i \ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in \( a \) to the right by the number of bits specified in the corresponding element of \( b \), and return the results using writemask \( k \) (elements are copied from \( src \) when the corresponding mask bit is not set).

\[

\[
\texttt{\_m256i \_mm256\_rorv\_epi64(_m256i \ a, \_m256i \ b)}
\]

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in \( a \) to the right by the number of bits specified in the corresponding element of \( b \), and return the results.
_mm_mask_sll_epi32
    __m128i _mm_mask_sll_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by count while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_mask_slli_epi32
    __m128i _mm_mask_slli_epi32(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by imm while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_sll_epi32
    __m128i _mm_maskz_sll_epi32(__mmask8 k, __m128i a, __m128i count)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by count while shifting in zeros, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_slli_epi32
    __m128i _mm_maskz_slli_epi32(__mmask8 k, __m128i a, unsigned int imm)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by imm while shifting in zeros, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sll_epi32
    __m256i _mm256_mask_sll_epi32(__m256i src, __mmask8 k, __m256i a, __m128i count)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by count while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm256_mask_slli_epi32
    __m256i _mm256_mask_slli_epi32(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by imm while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).
_mm256_maskz_sll_epi32

__m256i _mm256_maskz_sll_epi32(__mmask8 k, __m256i a, __m128i count)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by count while shifting in zeros, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_slli_epi32

__m256i _mm256_maskz_slli_epi32(__mmask8 k, __m256i a, unsigned int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpslld
Shift packed 32-bit integers in a left by imm while shifting in zeros, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).

_mm512 bslli_epi128

__m512i _mm512 bslli_epi128(__m512i a, int imm)

CPUID Flags: AVX512BW
Instruction(s): vpslldq
Shift 128-bit lanes in a left by imm bytes while shifting in zeros, and return the results.

_mm_mask_sll_epi64

__m128i _mm_mask_sll_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllq
Shift packed 64-bit integers in a left by count while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_mask_slli_epi64

__m128i _mm_mask_slli_epi64(__m128i src, __mmask8 k, __m128i a, unsigned int imm)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllq
Shift packed 64-bit integers in a left by imm while shifting in zeros, and return the results using writemask k (elements are copied from src when the corresponding mask bit is not set).

_mm_maskz_sll_epi64

__m128i _mm_maskz_sll_epi64(__mmask8 k, __m128i a, __m128i count)

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllq
Shift packed 64-bit integers in a left by count while shifting in zeros, and return the results using zeromask k (elements are zeroed out when the corresponding mask bit is not set).
**_mm_maskz_slli_epi64_**

```c
__m128i _mm_maskz_slli_epi64(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in `a` left by `imm` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_mask_sll_epi64_**

```c
__m256i _mm256_mask_sll_epi64(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in `a` left by `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm256_mask_slli_epi64_**

```c
__m256i _mm256_mask_slli_epi64(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in `a` left by `imm` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm256_maskz_sll_epi64_**

```c
__m256i _mm256_maskz_sll_epi64(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in `a` left by `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm256_maskz_slli_epi64_**

```c
__m256i _mm256_maskz_slli_epi64(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in `a` left by `imm` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm_mask_sllv_epi32_**

```c
__m128i _mm_mask_sllv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvd

...
Shift packed 32-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
__m128i __m_maskz_sllv_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllvd

Shift packed 32-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
__m256i __m256_mask_sllv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllvd

Shift packed 32-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
__m128i __m_maskz_sllv_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllvd

Shift packed 32-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

```c
__m128i __m_mask_sllv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllvq

Shift packed 64-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

```c
__m128i __m_maskz_sllv_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL
Instruction(s): vpsllvq

Shift packed 64-bit integers in a left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).
**_mm256_mask_sllv_epi64_**

```c
__m256i _mm256_mask_sllv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in `a` left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm256_maskz_sllv_epi64_**

```c
__m256i _mm256_maskz_sllv_epi64(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in `a` left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm_mask_sllv_epi16_**

```c
__m128i _mm_mask_sllv_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in `a` left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using writemask `k` (elements are copied from `src` when the corresponding mask bit is not set).

**_mm_maskz_sllv_epi16_**

```c
__m128i _mm_maskz_sllv_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in `a` left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results using zeromask `k` (elements are zeroed out when the corresponding mask bit is not set).

**_mm_sllv_epi16_**

```c
__m128i _mm_sllv_epi16(__m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in `a` left by the amount specified by the corresponding element in `count` while shifting in zeros, and return the results.

**_mm256_mask_sllv_epi16_**

```c
__m256i _mm256_mask_sllv_epi16(__m256i src, __mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL
Instruction(s): vpsllvw
Shift packed 16-bit integers in a left by the amount specified by the corresponding element in count while shifting in zeros, and return the results using writemask \( k \) (elements are copied from src when the corresponding mask bit is not set).

\[
_{\text{mm}256}\_\text{maskz\_sllv\_epi16}
\]

\[
_{\text{mm}256}\_\text{maskz\_sllv\_epi16}(\_\text{mmask16} \ k, \_\text{m256i} \ a, \_\text{m256i} \ count)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw
Shift packed 16-bit integers in a left by the amount specified by the corresponding element in count while shifting in zeros, and return the results using zeromask \( k \) (elements are zeroed out when the corresponding mask bit is not set).

\[
_{\text{mm}256}\_\text{sllv\_epi16}
\]

\[
_{\text{mm}256}\_\text{sllv\_epi16}(\_\text{m256i} \ a, \_\text{m256i} \ count)
\]

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw
Shift packed 16-bit integers in a left by the amount specified by the corresponding element in count while shifting in zeros, and return the results.

\[
_{\text{mm}512}\_\text{mask\_sllv\_epi16}
\]

\[
_{\text{mm}512}\_\text{mask\_sllv\_epi16}(\_\text{mmask32} \ k, \_\text{m512i} \ src, \_\text{mmask32} \ k, \_\text{m512i} \ a, \_\text{m512i} \ count)
\]

CPUID Flags: AVX512BW

Instruction(s): vpsllvw
