Optimization Notice

Intel’s compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel.

Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

Overview

Intel® Media Software Development Kit – SDK, further referred to as the SDK, is a software development library that exposes the media acceleration capabilities of Intel platforms for decoding, encoding and video processing. The API library covers a wide range of Intel platforms.

This document describes the SDK API.

Document Conventions

The SDK API uses the Verdana typeface for normal prose. With the exception of section headings and the table of contents, all code-related items appear in the Courier New typeface (mfxStatus and MFXInit). All class-related items appear in all cap boldface, such as DECODE and ENCODE. Member functions appear in initial cap boldface, such as Init and Reset, and these refer to members of all three classes, DECODE, ENCODE and VPP. Hyperlinks appear in underlined boldface, such as mfxStatus.

## Architecture

SDK functions fall into the following categories:

<table>
<thead>
<tr>
<th>Architecture</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DECODE</strong></td>
</tr>
<tr>
<td><strong>ENCODE</strong></td>
</tr>
<tr>
<td><strong>VPP</strong></td>
</tr>
<tr>
<td><strong>CORE</strong></td>
</tr>
<tr>
<td><strong>Misc</strong></td>
</tr>
</tbody>
</table>

With the exception of the global auxiliary functions, SDK functions are named after their functioning domain and category, as illustrated in Figure 1. Here, SDK only exposes video domain functions.

### Figure 1: SDK Function Naming Convention

<table>
<thead>
<tr>
<th>MFXVideoDECODE_DecodeFrameAsync</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Prefix</strong></td>
</tr>
</tbody>
</table>

Applications use SDK functions by linking with the SDK dispatcher library, as illustrated in Figure 2. The dispatcher library identifies the hardware acceleration device on the running platform, determines the most suitable platform library, and then redirects function calls. If the dispatcher is unable to detect any suitable platform-specific hardware, the dispatcher redirects SDK function calls to the default software library.

### Figure 2: SDK Library Dispatching Mechanism

---

## Video Decoding

The **DECODE** class of functions takes a compressed bitstream as input and converts it to raw frames as output.

**DECODE** processes only pure or elementary video streams. The library cannot process bitstreams that reside in a container format, such as MP4 or MPEG. The application must first de-multiplex the bitstreams. De-multiplexing extracts pure video streams out of the container format. The application can provide the input bitstream as one complete frame of data, less than one frame (a partial frame), or multiple frames. If only a partial frame is provided, **DECODE** internally constructs one frame of data before decoding it.

The time stamp of a bitstream buffer must be accurate to the first byte of the frame data. That is, the first byte of a video coding layer NAL unit for H.264, or picture header for MPEG-2 and VC-1. **DECODE** passes the time stamp to the output surface for audio and video multiplexing or synchronization.

Decoding the first frame is a special case, since **DECODE** does not provide enough configuration parameters to correctly process the bitstream. **DECODE** searches for the sequence header (a sequence parameter set in H.264, or a sequence header in MPEG-2 and VC-1) that contains the video configuration parameters used to encode subsequent video frames. The decoder skips any bitstream prior to that sequence header. In the case of multiple sequence headers in the bitstream, **DECODE** adopts the new configuration parameters, ensuring proper decoding of subsequent frames.

**DECODE** supports repositioning of the bitstream at any time during decoding. Because there is no way to obtain the correct sequence header associated with the specified bitstream position after a position change, the application must supply **DECODE** with a sequence header before the decoder can process the next frame at the new position. If the sequence header required to correctly decode the bitstream at the new position is not provided by the application, **DECODE** treats the new location as a new “first frame” and follows the procedure for decoding.
first frames.

**Video Encoding**

The ENCODE class of functions takes raw frames as input and compresses them into a bitstream.

Input frames usually come encoded in a repeated pattern called the Group of Picture (GOP) sequence. For example, a GOP sequence can start from an I-frame, followed by a few B-frames, a P-frame, and so on. ENCODE uses an MPEG-2 style GOP sequence structure that can specify the length of the sequence and the distance between two key frames: I- or P-frames. A GOP sequence ensures that the segments of a bitstream do not completely depend upon each other. It also enables decoding applications to reposition the bitstream.

ENCODE processes input frames in two ways:

- **Display order**: ENCODE receives input frames in the display order. A few GOP structure parameters specify the GOP sequence during ENCODE initialization. Scene change results from the video processing stage of a pipeline can alter the GOP sequence.

- **Encoded order**: ENCODE receives input frames in their encoding order. The application must specify the exact input frame type for encoding. ENCODE references GOP parameters to determine when to insert information such as an end-of-sequence into the bitstream.

An ENCODE output consists of one frame of a bitstream with the time stamp passed from the input frame. The time stamp is used for multiplexing subsequent video with other associated data such as audio. The SDK library provides only pure video stream encoding. The application must provide its own multiplexing.

ENCODE supports the following bitrate control algorithms: constant bitrate, variable bitrate (VBR), and constant Quantization Parameter (QP). In the constant bitrate mode, ENCODE performs stuffing when the size of the least-compressed frame is smaller than what is required to meet the Hypothetical Reference Decoder (HRD) buffer (or VBR) requirements. (Stuffing is a process that appends zeros to the end of encoded frames.)

**Video Processing**

Video processing (VPP) takes raw frames as input and provides raw frames as output.

*Figure 3: Video Processing Operation Pipeline*

The actual conversion process is a chain operation with many single-function filters, as Figure 3 illustrates. The application specifies the input and output format, and the SDK configures the pipeline accordingly. The application can also attach one or more hint structures to configure individual filters or turn them on and off. Unless specifically instructed, the SDK builds the pipeline in a way that best utilizes hardware acceleration or generates the best video processing quality.

Table 1 shows the SDK video processing features. The application can configure supported video processing features through the video processing I/O parameters. The application can also configure optional features through hints. See "Video Processing procedure / Configuration" for more details on how to configure optional filters.

</table>

X indicates a supported function

*Conversions absent from this table are unsupported

The SDK video processing pipeline supports limited functionality for RGB4 input. Only filters that are required to convert input format to output one are included in pipeline. All optional filters are skipped. See description of MFX_WRN_FILTER_SKIPPED warning for more details on how to retrieve list of active filters.

</tbody>
</table>

X indicates a supported function.

This table describes pure deinterlacing algorithm. The application can combine it with frame rate conversion to achieve any desirable input/output frame rate ratio. Note, that in this table input rate is field rate, i.e. number of video fields in one second of video. The SDK uses frame rate in all configuration parameters, so this input field rate should be divided by two during the SDK configuration. For example, 60i to 60p conversion in this table is represented by right bottom cell. It should be described in mfxVideoParam as input frame rate equal to 30 and output 60.

SDK support two HW-accelerated deinterlacing algorithms: BOB DI (in Linux’s libVA terms VAProcDeinterlacingBob) and Advanced DI (VAProcDeinterlacingMotionAdaptive). Default is ADI (Advanced DI) which uses reference frames and has better quality. BOB DI is faster than ADI mode. So user can select as usual between speed and quality.

User can exactly configure DI modes via mfxExtVPPDeinterlacing.

There is one special mode of deinterlacing available in combination with frame rate conversion. If VPP input frame is interlaced (TFF or BFF) and output is progressive and ratio between source frame rate and destination frame rate is ½ (for example 30 to 60, 29.97 to 59.94, 25 to 50), special mode of VPP turned on: for 30 interlaced input frames application will get 60 different progressive output frames.

X indicates a supported function

The SDK video processing pipeline supports limited HW acceleration for P010 format - zeroed

mfxFrameInfo::Shift leads to partial acceleration.

The SDK video processing pipeline does not support HW acceleration for P210 format.

Programming Guide

This chapter describes the concepts used in programming the SDK.

The application must use the include file, mfxvideo.h (for C programming), or mfxvideo++.h (for C++ programming), and link the SDK static dispatcher library, libmfx.lib or libmfx.a. If the application is written in C then libstdc++.a library should also be linked.

Include these files:

```c
#include "mfxvideo.h"  /* The SDK include file */
#include "mfxvideo++.h" /* Optional for C++ development */
```

Link this library:

```c
libmfx.lib /* The SDK static dispatcher library */
```

or

```c
libmfx.a  /* The SDK static dispatcher library */
```

On Linux* there is slight difference between using dispatcher library from executable module or from shared object. To mitigate symbol conflict between itself and SDK shared object on Linux*, application should:

1. link against dispatch_shared.a instead of libmfx.a
2. define MFX_DISPATCHER_EXPOSED_PREFIX before any SDK includes

Status Codes

The SDK functions organize into classes for easy reference. The classes include ENCODE (encoding functions), DECODE (decoding functions), and VPP (video processing functions).

Init, Reset and Close are member functions within the ENCODE, DECODE and VPP classes that initialize, restart and de-initialize specific operations defined for the class. Call all other member functions within a given class (except Query and QueryIOSurf) within the Init … Reset (optional) … Close sequence.

The Init and Reset member functions both set up necessary internal structures for media processing. The difference between the two is that the Init functions allocate memory while the Reset functions only reuse allocated internal memory. Therefore, Reset can fail if the SDK needs to allocate additional memory. Reset functions can also fine-tune ENCODE and VPP parameters during those processes or reposition a bitstream during DECODE.

All SDK functions return status codes to indicate whether an operation succeeded or failed. See the mfxStatus enumerator for all defined status codes. The status code MFX_ERR_NONE indicates that the function successfully completed its operation. Status codes are less than MFX_ERR_NONE for all errors and greater than MFX_ERR_NONE for all warnings.

If an SDK function returns a warning, it has sufficiently completed its operation, although the output of the function might not be strictly reliable. The application must check the validity of the output generated by the function.

If an SDK function returns an error (except MFX_ERR_MORE_DATA or MFX_ERR_MORE_SURFACE or MFX_ERR_MORE_BITSTREAM), the function aborts the operation. The application must call either the Reset function to put the class back to a clean state, or the Close function to terminate the operation. The behavior is undefined if the application continues to call any class member functions without a Reset or Close. To avoid memory leaks, always call the Close function after Init.

SDK Session

Before calling any SDK functions, the application must initialize the SDK library and create an SDK session. An SDK session maintains context for the use of any of DECODE, ENCODE, or VPP functions.

The function MFXInit starts (initializes) an SDK session. MFXClose closes (de-initializes) the SDK session. To avoid memory leaks, always call MFXClose after MFXInit.

The application can initialize a session as a software-based session (MFX_IMPL_SOFTWARE) or a hardware-based session (MFX_IMPL_HARDWARE). In the former case, the SDK functions execute on a CPU, and in the latter case, the SDK functions use platform acceleration capabilities. For platforms that expose multiple graphic devices, the application can initialize the SDK session on any alternative graphic device (MFX_IMPL_HARDWARE1...MFX_IMPL_HARDWARE4).

The application can also initialize a session to be automatic (MFX_IMPL_AUTO or MFX_IMPL_AUTO_ANY), instructing the dispatcher library to detect the platform capabilities and choose the best SDK library available. After initialization, the SDK returns the actual implementation through the MFXQueryIMPL function.
Multiple Sessions
Each SDK session can run exactly one instance of **DECODE**, **ENCODE** and **VPP** functions. This is good for a simple transcoding operation. If the application needs more than one instance of **DECODE**, **ENCODE** and **VPP** in a complex transcoding setting, or needs more simultaneous transcoding operations to balance CPU/GPU workloads, the application can initialize multiple SDK sessions. Each SDK session can independently be a software-based session or hardware-based session.

The application can use multiple SDK sessions independently or run a “joined” session. Independently operated SDK sessions cannot share data unless the application explicitly synchronizes session operations (to ensure that data is valid and complete before passing from the source to the destination session.)

To join two sessions together, the application can use the function **MFXJoinSession**. Alternatively, the application can use the function **MFXCloneSession** to duplicate an existing session. Joined SDK sessions work together as a single session, sharing all session resources, threading control and prioritization operations (except hardware acceleration devices and external allocators). When joined, one of the sessions (the first join) serves as a parent session, scheduling execution resources, with all others child sessions relying on the parent session for resource management.

With joined sessions, the application can set the priority of session operations through the **MFXSetPriority** function. A lower priority session receives less CPU cycles. Session priority does not affect hardware accelerated processing.

After the completion of all session operations, the application can use the function **MFXDisjoinSession** to remove the joined state of a session. Do not close the parent session until all child sessions are disjoined or closed.

Frame and Fields
In SDK terminology, a frame (or frame surface, interchangeably) contains either a progressive frame or a complementary field pair. If the frame is a complementary field pair, the odd lines of the surface buffer store the top fields and the even lines of the surface buffer store the bottom fields.

Frame Surface Locking
During encoding, decoding or video processing, cases arise that require reserving input or output frames for future use. In the case of decoding, for example, a frame that is ready for output must remain as a reference frame until the current sequence pattern ends. The usual approach is to cache the frames internally. This method requires a copy operation, which can significantly reduce performance.

SDK functions define a frame-locking mechanism to avoid the need for copy operations. This mechanism is as follows:

- The application allocates a pool of frame surfaces large enough to include SDK function I/O frame surfaces and internal cache needs. Each frame surface maintains a `Locked` counter, part of the `mfxFrameData` structure. Initially, the `Locked` counter is set to zero.
- The application calls an SDK function with frame surfaces from the pool, whose `Locked` counter is zero. If the SDK function needs to reserve any frame surface, the SDK function increases the `Locked` counter of the frame surface. A non-zero `Locked` counter indicates that the calling application must treat the frame surface as "in use." That is, the application can read, but cannot alter, move, delete or free the frame surface.
- In subsequent SDK executions, if the frame surface is no longer in use, the SDK decreases the `Locked` counter. When the `Locked` counter reaches zero, the application is free to do as it wishes with the frame surface.

In general, the application must not increase or decrease the `Locked` counter, since the SDK manages this field. If, for some reason, the application needs to modify the `Locked` counter, the operation must be atomic to avoid race condition. **Modifying the Locked counter is not recommended.**

Decoding Procedures
Example 1 shows the pseudo code of the decoding procedure. The following describes a few key points:

- The application can use the **MFXVideoDECODE_DecodeHeader** function to retrieve decoding initialization parameters from the bitstream. This step is optional if such parameters are retrievable from other sources such as an audio/video splitter.
- The application uses the **MFXVideoDECODE_QueryIOSurf** function to obtain the number of working frame surfaces required to reorder output frames.
- The application calls the **MFXVideoDECODE_DecodeFrameAsync** function for a decoding operation, with the bitstream buffer (bits), and an unlocked working frame surface (work) as input parameters. If decoding output is not available, the function returns a status code requesting additional bitstream input or working frame surfaces as follows:

**MFX_ERR_MORE_DATA**: The function needs additional bitstream input. The existing buffer contains less than a frame worth of bitstream data.

**MFX_ERR_MORE_SURFACE**: The function needs one more frame surface to produce any output.

**MFX_ERR_REALLOC_SURFACE**: Dynamic resolution change case - the function needs bigger working frame surface
Upon successful decoding, the MFXVideoDECODE_DecodeFrameAsync function returns MFX_ERR_NONE. However, the decoded frame data (identified by the disp pointer) is not yet available because the MFXVideoDECODE_DecodeFrameAsync function is asynchronous. The application must use the MFXVideoCORE_SyncOperation function to synchronize the decoding operation before retrieving the decoded frame data.

At the end of the bitstream, the application continuously calls the MFXVideoDECODE_DecodeFrameAsync function with a NULL bitstream pointer to drain any remaining frames cached within the SDK decoder, until the function returns MFX_ERR_MORE_DATA.

**Bitstream Repositioning**

The application can use the following procedure for bitstream reposition during decoding:

- Use the MFXVideoDECODE_Reset function to reset the SDK decoder.
- Optionally, if the application maintains a sequence header that decodes correctly the bitstream at the new position, the application may insert the sequence header to the bitstream buffer.
- Append the bitstream from the new location to the bitstream buffer.
- Resume the decoding procedure. If the sequence header is not inserted in the above steps, the SDK decoder searches for a new sequence header before starting decoding.

**Example 1: Decoding Pseudo Code**

```cpp
MFXVideoDECODE_DecodeHeader(session, bitstream, &init_param);
MFXVideoDECODE_QueryIOSurf(session, &init_param, &request);
allocate_pool_of_frame_surfaces(request.NumFrameSuggested);
MFXVideoDECODE_Init(session, &init_param);
sts=MFX_ERR_MORE_DATA;
for (;;) {
    if (sts==MFX_ERR_MORE_DATA && !end_of_stream())
        append_more_bitstream(bitstream);
    find_unlocked_surface_from_the_pool(&work);
    bits=(end_of_stream())?NULL:bitstream;
    sts=MFXVideoDECODE_DecodeFrameAsync(session,bits,work,&disp,&syncp);
    if (sts==MFX_ERR_MORE_SURFACE)
        continue;
    if (end_of_bitstream() && sts==MFX_ERR_MORE_DATA)
        break;
    if (sts==MFX_ERR_REALLOC_SURFACE) {
        MFXVideoDECODE_GetVideoParam(session, &param);
        realloc_surface(work, param.mfx.FrameInfo);
        continue;
    }
    // other error handling
    if (sts==MFX_ERR_NONE) {
        MFXVideoCORE_SyncOperation(session, syncp, INFINITE);
        do_something_with_decoded_frame(disp);
    }
}
MFXVideoDECODE_Close();
free_pool_of_frame_surfaces();
```

**Multiple Sequence Headers**

The bitstream can contain multiple sequence headers. The SDK function returns a status code to indicate when a new sequence header is parsed.

The MFXVideoDECODE_DecodeFrameAsync function returns MFX_WRN_VIDEO_PARAM_CHANGED if the SDK decoder parsed a new sequence header in the bitstream and decoding can continue with existing frame buffers. The application can optionally retrieve new video parameters by calling MFXVideoDECODE_GetVideoParam.

The MFXVideoDECODE_DecodeFrameAsync function returns MFX_ERR_INCOMPATIBLE_VIDEO_PARAM if the decoder parsed a new sequence header in the bitstream and decoding cannot continue without reallocating frame buffers. The bitstream pointer moves to the first bit of the new sequence header. The application must do the following:

- Retrieve any remaining frames by calling MFXVideoDECODE_DecodeFrameAsync with a NULL input bitstream pointer until the function returns MFX_ERR_MORE_DATA. This step is not necessary if the application plans to discard any remaining frames.
- De-initialize the decoder by calling the MFXVideoDECODE_Close function, and restart the decoding procedure from the new bitstream position.

**Broken Streams Handling**

Robustness and capability to handle broken input stream is important part of the decoder.

First of all, start code prefix (ITU-T H.264 3.148 and ITU-T H.265 3.142) is used to separate NAL units. Then all
syntax elements in bitstream are parsed and verified. If any of elements violate the specification then input bitstream is considered as invalid and decoder tries to re-sync (find next start code). The further decoder's behavior is depend on which syntax element is broken:

- SPS header – return **MFX_ERR_INCOMPATIBLE_VIDEO_PARAM** (HEVC decoder only, AVC decoder uses last valid)
- PPS header – re-sync, use last valid PPS for decoding
- Slice header – skip this slice, re-sync
- Slice data - Corruption flags are set on output surface

**Note:**
Some requirements are relaxed because there are a lot of streams which violate the letter of standard but can be decoded without errors.

- Many streams have IDR frames with `frame_num != 0` while specification says that "If the current picture is an IDR picture, `frame_num` shall be equal to 0." (ITU-T H.265 7.4.3)
- VUI is also validated, but errors doesn't invalidate the whole SPS, decoder either doesn't use corrupted VUI (AVC) or resets incorrect values to default (HEVC).

The corruption at reference frame is spread over all inter-coded pictures which use this reference for prediction. To cope with this problem you either have to periodically insert I-frames (intra-coded) or use 'intra refresh' technique. The latter allows to recover corruptions within a pre-defined time interval. The main point of 'intra refresh' is to insert cyclic intra-coded pattern (usually row) of macroblocks into the inter-coded pictures, restricting motion vectors accordingly. Intra-refresh is often used in combination with Recovery point SEI, where `recovery_frame_cnt` is derived from intra-refresh interval.

Recovery point SEI message is well described at ITU-T H.264 D.2.7 and ITU-T H.265 D.2.8. This message can be used by the decoder to understand from which picture all subsequent (in display order) pictures contain no errors, if we start decoding from AU associated with this SEI message. In opposite to IDR, recovery point message doesn't mark reference pictures as "unused for reference".

Besides validation of syntax elements and theirs constrains, decoder also uses various hints to handle broken streams.

- If there are no valid slices for current frame – the whole frame is skipped.
- The slices which violate slice segment header semantics (ITU-T H.265 7.4.7.1) are skipped. Only `slice_temporal_mvp_enabled_flag` is checked for now.
- Since LTR (Long Term Reference) stays at DPB until it will be explicitly cleared by IDR or MMCO, the incorrect LTR could cause long standing visual artifacts. AVC decoder uses the following approaches to care about this:
  - When we have DPB overflow in case incorrect MMCO command which marks reference picture as LT, we rollback this operation
  - An IDR frame with `frame_num != 0` can't be LTR
- If decoder detects frame gapping, it inserts 'fake' (marked as non-existing) frames, updates FrameNumWrap (ITU-T H.264 8.2.4.1) for reference frames and applies Sliding Window (ITU-T H.264 8.2.5.3) marking process. 'Fake' frames are marked as reference, but since they are marked as non-existing they are not really used for inter-prediction.

**Encoding Procedures**

Example 2 shows the pseudo code of the encoding procedure. The following describes a few key points:

- The application uses the **MFXVideoENCODE_QueryIOSurf** function to obtain the number of working frame surfaces required for reordering input frames.
- The application calls the **MFXVideoENCODE_EncodeFrameAsync** function for the encoding operation. The input frame must be in an unlocked frame surface from the frame surface pool. If the encoding output is not available, the function returns the status code **MFX_ERR_MORE_DATA** to request additional input frames.
- Upon successful encoding, the **MFXVideoENCODE_EncodeFrameAsync** function returns **MFX_ERR_NONE**. However, the encoded bitstream is not yet available because the **MFXVideoENCODE_EncodeFrameAsync** function is asynchronous. The application must use the **MFXVideoCORE_SyncOperation** function to synchronize the encoding operation before retrieving the encoded bitstream.
- At the end of the stream, the application continuously calls the **MFXVideoENCODE_EncodeFrameAsync** function with NULL surface pointer to drain any remaining bitstreams cached within the SDK encoder, until the function returns **MFX_ERR_MORE_DATA**.

**Note:** It is the application's responsibility to fill pixels outside of crop window when it is smaller than frame to be encoded. Especially in cases when crops are not aligned to minimum coding block size (16 for AVC, 8 for HEVC and VP9).

**Configuration Change**

The application changes configuration during encoding by calling **MFXVideoENCODE_Reset** function. Depending on difference in configuration parameters before and after change, the SDK encoder either continues current
sequence or starts a new one. If the SDK encoder starts a new sequence it completely resets internal state and begins a new sequence with IDR frame.

The application controls encoder behavior during parameter change by attaching `mfxExtEncoderResetOption` to `mfxVideoParam` structure during reset. By using this structure, the application instructs encoder to start or not to start a new sequence after reset. In some cases request to continue current sequence cannot be satisfied and encoder fails during reset. To avoid such cases the application may query reset outcome before actual reset by calling `MFVideocodeCODE_Query` function with `mfxExtEncoderResetOption` attached to `mfxVideoParam` structure.

The application uses the following procedure to change encoding configurations:

- The application retrieves any cached frames in the SDK encoder by calling the `MFVideocodeCODE_EncodeFrameAsync` function with a NULL input frame pointer until the function returns `MFX_ERR_MORE_DATA`.

**Note:** The application must set the initial encoding configuration flag `EndOfStream` of the `mfxExtCodingOption` structure to OFF to avoid inserting an End of Stream (EOS) marker into the bitstream. An EOS marker causes the bitstream to terminate before encoding is complete.

- The application calls the `MFVideocodeCODE_Reset` function with the new configuration:
- If the function successfully set the configuration, the application can continue encoding as usual.
- If the new configuration requires a new memory allocation, the function returns `MFX_ERR_INCOMPATIBLE_VIDEO_PARAM`. The application must close the SDK encoder and reinitialize the encoding procedure with the new configuration.

**Example 2: Encoding Pseudo Code**

```c
MFVideocodeCODE_QueryIOSurf(session, &init_param, &request);
allocate_pool_of_frame_surfaces(request.NumFrameSuggested);
MFVideocodeCODE_Init(session, &init_param);
sts=MFX_ERR_MORE_DATA;
for (;;) {
    if (sts==MFX_ERR_MORE_DATA && !end_of_stream()) {
        find_unlocked_surface_from_the_pool(&surface);
        fill_content_for_encoding(surface);
    }
    surface2=end_of_stream()?NULL:surface;
    if (end_of_stream() && sts==MFX_ERR_MORE_DATA) break;
    // other error handling
    if (sts==MFX_ERR_NONE) {
        MFVideocodeCORE_SyncOperation(session, syncp, INFINITE);
        do_something_with_encoded_bits(bits);
    }
}MFXVideoENCODE_Close();
free_pool_of_frame_surfaces();
```

**External Bit Rate Control**

The application can make encoder use external BRC instead of native one. In order to do that it should attach to `mfxVideoParam` structure `mfxExtCodingOption2` with `ExtBRC = MFX_CODINGOPTION_ON` and callback structure `mfxExtBRC` during encoder initialization. Callbacks `Init`, `Reset` and `Close` will be invoked inside `MFVideocodeCODE_Init`, `MFVideocodeCODE_Reset` and `MFVideocodeCODE_Close` correspondingly. Figure 4 illustrates usage of `GetFrameCtrl` and `Update`.

**Figure 4: Asynchronous Encoding Flow With External BRC**
**mfxExtBRC**

- **GetFrameCtrl(X)**
  - X.NumRecode++
- **Submit Frame X Encoding S++;**
- **Update(X)**
  - X.NumRecode++
  - **Do Padding**
    - Yes
  - **Cancel Encoding For Frames > X;**
    - N=(X+1); S=0;
  - **Skip Frame X**
    - Yes

**SDK**

- **Get Surface for Frame N;**
  - X=N; N++; X.NumRecode=0;
  - **MFX_BRC_SMALL_FRAME**
  - **MFX_BRC_BIG_FRAME**
- **Wait for Frame X; S--;**
  - X = (N-S)
- **Cancel Encoding For Frames > X;**
  - N=(X+1); S=0;

**IntAsyncDepth** is the SDK max internal asynchronous encoding queue size; it is always less than or equal to *mfxVideoParam::AsyncDepth*.

**Example 3: External BRC Pseudo Code**

```c
#include "mfxvideo.h"
#include "mfxbrc.h"

typedef struct {
    mfxU32 EncodedOrder;
    mfxI32 QP;
    mfxU32 MaxSize;

...
The SDK configures the video processing pipeline operation based on the difference between the input and output formats, specified in the `mfxVideoParam` structure. A few examples follow:

- When the input color format is YUY2 and the output color format is NV12, the SDK enables color conversion from YUY2 to NV12.
- When the input is interlaced and the output is progressive, the SDK enables de-interlacing.
- When the input is single field and the output is interlaced or progressive, the SDK enables field weaving, optionally with deinterlacing.
- When the input is interlaced and the output is single field, the SDK enables field splitting.

In addition to specifying the input and output formats, the application can provide hints to fine-tune the video processing pipeline operation. The application can disable filters in pipeline by using `mfxExtVPPDoNotUse` structure; enable them by using `mfxExtVPPDoUse` structure and configure them by using dedicated configuration structures. See Table 4 for complete list of configurable video processing filters, their IDs and configuration structures. See the `ExtendedBufferID` enumerator for more details.

The SDK ensures that all filters necessary to convert input format to output one are included in pipeline. However, the SDK can skip some optional filters even if they are explicitly requested by the application, for example, due to limitation of underlying hardware. To notify application about this skip, the SDK returns warning `MFX_WRN_FILTER_SKIPPED`. The application can retrieve list of active filters by attaching `mfxExtVPPDoUse` structure to `mfxVideoParam` structure and calling `MFXVideoVPP_GetVideoParam` function. The application must allocate enough memory for filter list.

### Table 4 Configurable VPP filters

<table>
<thead>
<tr>
<th>Filter ID</th>

Example 5 shows how to configure the SDK video processing.

### Example 5: Configure Video Processing

```c
/* enable image stabilization filter with default settings */
mfxExtVPPDoUse du;
mfxU32 al=MFX_EXTBUFF_VPP_IMAGE_STABILIZATION;

du.Header.BufferId=MFX_EXTBUFF_VPP_DOUSE;
du.Header.BufferSz=sizeof(mfxExtVPPDoUse);
du.NumAlg=1;
du.AlgList=&al;

/* configure the mfxVideoParam structure */
mfxVideoParam conf;
mfxExtBuffer *eb=&du;
memset(&conf,0,sizeof(conf));
conf.IOPattern=MFX_IOPATTERN_IN_SYSTEM_MEMORY|
MFX_IOPATTERN_OUT_SYSTEM_MEMORY;
conf.NumExtParam=1;
conf.ExtParam=eb;

conf.vpp.In.FourCC=MFX_FOURCC_YV12;
conf.vpp.Out.FourCC=MFX_FOURCC_NV12;

/* video processing initialization */
MFXVideoVPP_Init(session, &conf);
```

### Region of Interest

During video processing operations, the application can specify a region of interest for each frame, as illustrated in Figure 5.

**Figure 5: VPP Region of Interest Operation**
Specifying a region of interest guides the resizing function to achieve special effects such as resizing from 16:9 to 4:3 while keeping the aspect ratio intact. Use the CropX, CropY, CropW and CropH parameters in the mfxVideoParam structure to specify a region of interest. Table 5 shows some examples.

**Table 5: Examples of VPP Operations on Region of Interest**

<table>
<thead>
<tr>
<th>Operation</th>
<th>VPP Input Width/Height</th>
<th>VPP Input CropX, CropY, CropW, CropH</th>

</tbody>
</table>

**Transcoding Procedures**

The application can use the SDK encoding, decoding and video processing functions together for transcoding operations. This section describes the key aspects of connecting two or more SDK functions together.

**Asynchronous Pipeline**

The application passes the output of an upstream SDK function to the input of the downstream SDK function to construct an asynchronous pipeline. Such pipeline construction is done at runtime and can be dynamically changed, as illustrated in Example 6.

**Example 6: Pseudo Code of Asynchronous Pipeline Construction**

```c
mfxSyncPoint sp_d, sp_e;
MFXVideoDECODE_DecodeFrameAsync(session, bs, work, &vin, &sp_d);
if (going_through_vpp) {
    MFXVideoVPP_RunFrameVPPAsync(session, vin, vout, &sp_d);
    MFXVideoENCODE_EncodeFrameAsync(session, NULL, vout, bits2, &sp_e);
} else {
    MFXVideoENCODE_EncodeFrameAsync(session, NULL, vin, bits2, &sp_e);
}
MFXVideoCORE_SyncOperation(session, sp_e, INFINITE);
```

The SDK simplifies the requirement for asynchronous pipeline synchronization. The application only needs to synchronize after the last SDK function. Explicit synchronization of intermediate results is not required and in fact can slow performance.

The SDK tracks the dynamic pipeline construction and verifies dependency on input and output parameters to ensure the execution order of the pipeline function. In Example 6, the SDK will ensure MFXVideoENCODE_EncodeFrameAsync does not begin its operation until MFXVideoDECODE_DecodeFrameAsync or MFXVideoVPP_RunFrameVPPAsync has finished.

During the execution of an asynchronous pipeline, the application must consider the input data in use and must not change it until the execution has completed. The application must also consider output data unavailable until the execution has finished. In addition, for encoders, the application must consider extended and payload buffers in use while the input surface is locked.
The SDK checks dependencies by comparing the input and output parameters of each SDK function in the pipeline. Do not modify the contents of input and output parameters before the previous asynchronous operation finishes. Doing so will break the dependency check and can result in undefined behavior. An exception occurs when the input and output parameters are structures, in which case overwriting fields in the structures is allowed. (Note that the dependency check works on the pointers to the structures only.)

There are two exceptions with respect to intermediate synchronization:

- The application must synchronize any input before calling the SDK function `MFXVideoDECODE_DecodeFrameAsync`, if the input is from any asynchronous operation.
- When the application calls an asynchronous function to generate an output surface in video memory and passes that surface to a non-SDK component, it must explicitly synchronize the operation before passing the surface to the non-SDK component.

**Example 7: Pseudo Code of Asynchronous ENC->ENCODE Pipeline Construction**

```c
mfxENCInput enc_in = ...;
mfxENCOutput enc_out = ...;
mfxSyncPoint sp_e, sp_n;
mfxFrameSurface1* surface = get_frame_to_encode();
mxExtBuffer dependency;
dependency.BufferId = MFX_EXTBUFF_TASK_DEPENDENCY;
dependency.BufferSz = sizeof(mfxExtBuffer);
enc_in.InSurface = surface;
enc_out.ExtParam[enc_out.NumExtParam++] = &dependency;
MFXVideoENC_ProcessFrameAsync(session, &enc_in, &enc_out, &sp_e);
MFXVideoENC_EncodeFrameAsync(session, NULL, surface, &bs, &sp_n);
MFXVideoCORE_SyncOperation(session, sp_n, INFINITE);
surface->Data.NumExtParam--;
```

**Surface Pool Allocation**

When connecting SDK function A to SDK function B, the application must take into account the needs of both functions to calculate the number of frame surfaces in the surface pool. Typically, the application can use the formula Na+Nb, where Na is the frame surface needs from SDK function A output, and Nb is the frame surface needs from SDK function B input.

For performance considerations, the application must submit multiple operations and delays synchronization as much as possible, which gives the SDK flexibility to organize internal pipelining. For example, the operation sequence, `ENCODE(f1)->ENCODE(f2)->SYNC(f1)->SYNC(f2)` is recommended, compared with `ENCODE(f1)->SYNC(f1)->ENCODE(f2)->SYNC(f2)`.

In this case, the surface pool needs additional surfaces to take into account multiple asynchronous operations before synchronization. The application can use the `AsyncDepth` parameter of the `mfxVideoParam` structure to inform an SDK function that how many asynchronous operations the application plans to perform before synchronization. The corresponding SDK `QueryIOSurf` function will reflect such consideration in the `NumFrameSuggested` value. Example 8 shows a way of calculating the surface needs based on `NumFrameSuggested` values.

**Example 8: Calculate Surface Pool Size**

```c
async_depth=4;
init_param_v.AsyncDepth=async_depth;
MFXVideoVPP_QueryIOSurf(session, &init_param_v, response_v);
init_param_e.AsyncDepth=async_depth;
MFXVideoENCODE_QueryIOSurf(session, &init_param_e, &response_e);
num_surfaces=   response_v[1].NumFrameSuggested
               +response.e.NumFrameSuggested
               -async_depth; /* double counted in ENCODE & VPP */
```

**Pipeline Error Reporting**

During asynchronous pipeline construction, each stage SDK function will return a synchronization point (sync point). These synchronization points are useful in tracking errors during the asynchronous pipeline operation. Assume the pipeline is A->B->C. The application synchronizes on sync point C. If the error occurs in SDK function C, then the synchronization returns the exact error code. If the error occurs before SDK function C, then the synchronization returns MFX_ERR_ABORTED. The application can then try to synchronize on sync point B. Similarly, if the error occurs in SDK function B, the synchronization returns the exact error code, or else MFX_ERR_ABORTED. Same logic applies if the error occurs in SDK function A.

**Working with hardware acceleration**
To fully utilize the SDK acceleration capability, the application should support OS specific infrastructures, Microsoft* DirectX* for Microsoft* Windows* and VA API for Linux*. The exception is transcoding scenario where opaque memory type may be used. See Surface Type Neutral Transcoding for more details.

The hardware acceleration support in application consists of video memory support and acceleration device support.

Depending on usage model, the application can use video memory on different stages of pipeline. Three major scenarios are illustrated on Figure 6.

**Figure 6 Usage of video memory for hardware acceleration**

The application must use the IOPattern field of the mfxVideoParam structure to indicate the I/O access pattern during initialization. Subsequent SDK function calls must follow this access pattern. For example, if an SDK function operates on video memory surfaces at both input and output, the application must specify the access pattern IOPattern at initialization in MFX_IOPATTERN_IN_VIDEO_MEMORY for input and MFX_IOPATTERN_OUT_VIDEO_MEMORY for output. This particular I/O access pattern must not change inside the Init ... Close sequence.

Initialization of any hardware accelerated SDK component requires the acceleration device handle. This handle is also used by SDK component to query HW capabilities. The application can share its device with the SDK by passing device handle through the MFXVideoCORE_SetHandle function. It is recommended to share the handle before any actual usage of the SDK.

**Working with Microsoft* DirectX* Applications**

The SDK supports two different infrastructures for hardware acceleration on Microsoft* Windows* OS, "Direct3D 9 DXVA2" and "Direct3D 11 Video API". In the first one the application should use the IDirect3DDeviceManager9 interface as the acceleration device handle, in the second one - ID3D11Device interface. The application should share one of these interfaces with the SDK through the MFXVideoCORE_SetHandle function. If the application does not provide it, then the SDK creates its own internal acceleration device. This internal device could not be accessed by the application and as a result, the SDK input and output will be limited to system memory only. That in turn will reduce SDK performance. If the SDK fails to create a valid acceleration device, then SDK cannot proceed with hardware acceleration and returns an error status to the application.

The application must create the Direct3D9* device with the flag D3DCREATE_MULTITHREADED. Additionally the flag D3DCREATE_FPU_PRESERVE is recommended. This influences floating-point calculations, including PTS values.

The application must also set multithreading mode for Direct3D11* device. Example 9 Setting multithreading mode illustrates how to do it.

**Example 9 Setting multithreading mode**

```c
ID3D11Device *pD11Device;
ID3D11DeviceContext *pD11Context;
ID3D10Multithread *pD10Multithread;
pD11Device->GetImmediateContext(&pD11Context);
pD11Context->QueryInterface(IID_ID3D10Multithread, &pD10Multithread);
pD10Multithread->SetMultithreadProtected(true);
```

During hardware acceleration, if a Direct3D* "device lost" event occurs, the SDK operation terminates with the return status MFX_ERR_DEVICE_LOST. If the application provided the Direct3D* device handle, the application must reset the Direct3D* device.

When the SDK decoder creates auxiliary devices for hardware acceleration, it must allocate the list of Direct3D* surfaces for I/O access, also known as the surface chain, and pass the surface chain as part of the device creation command. In most cases, the surface chain is the frame surface pool mentioned in the Frame Surface Locking section.
The application passes the surface chain to the SDK component Init function through an SDK external allocator callback. See the Memory Allocation and External Allocators section for details.

Only decoder Init function requests external surface chain from the application and uses it for auxiliary device creation. Encoder and VPP Init functions may only request internal surfaces. See the ExtMemFrameType enumerator for more details about different memory types.

Depending on configuration parameters, SDK requires different surface types. It is strongly recommended to call one of the MFXVideoENCODE_QueryIOSurf, MFXVideoDECODE_QueryIOSurf or MFXVideoVPP_QueryIOSurf functions to determine the appropriate type.

Table 6: Supported SDK Surface Types and Color Formats for Direct3D9 shows supported Direct3D9 surface types and color formats. Table 7: Supported SDK Surface Types and Color Formats for Direct3D11 shows Direct3D11 types and formats. Note, that NV12 is the major encoding and decoding color format. Additionally, JPEG/MJPEG decoder supports RGB32 and YUY2 output, JPEG/MJPEG encoder supports RGB32 and YUY2 input for Direct3D9/Direct3D11 and YV12 input for Direct3D9 only, and VPP supports RGB32 output.

Table 7: Supported SDK Surface Types and Color Formats for Direct3D11

Note: "Decoder Render Target" corresponds to D3D11_BIND_DECODER flag, "Processor Render Target" to D3D11_BIND_RENDERER_TARGET.

Working with VA API Applications

The SDK supports single infrastructure for hardware acceleration on Linux* - "VA API". The application should use the VADisplay interface as the acceleration device handle for this infrastructure and share it with the SDK through the MFXVideoCORE_SetHandle function. Because the SDK does not create internal acceleration device on Linux, the application must always share it with the SDK. This sharing should be done before any actual usage of the SDK, including capability query and component initialization. If the application fails to share the device, the SDK operation will fail.

Example 10 Obtaining VA display from X Window System and Example 10 Obtaining VA display from Direct Rendering Manager show how to obtain and share VA display with the SDK.

Example 10 Obtaining VA display from X Window System
Display *x11_display;
VADisplay va_display;

x11_display = XOpenDisplay(current_display);
va_display = vaGetDisplay(x11_display);
MFXVideoCORE_SetHandle(session, MFX_HANDLE_VA_DISPLAY,
(mfxHDL) va_display);

Example 11 Obtaining VA display from Direct Rendering Manager

int card;
VADisplay va_display;
card = open("/dev/dri/card0", O_RDWR); /* primary card */
va_display = vaGetDisplayDRM(card);
vaInitialize(va_display, &major_version, &minor_version);
MFXVideoCORE_SetHandle(session, MFX_HANDLE_VA_DISPLAY,
(mfxHDL) va_display);

When the SDK decoder creates hardware acceleration device, it must allocate the list of video memory surfaces for
I/O access, also known as the surface chain, and pass the surface chain as part of the device creation command.
The application passes the surface chain to the SDK component Init function through an SDK external allocator
callback. See the Memory Allocation and External Allocators section for details.

Only decoder Init function requests external surface chain from the application and uses it for device creation.
Encoder and VPP Init functions may only request internal surfaces. See the ExtMemFrameType enumerator for
more details about different memory types.

The VA API does not define any surface types and the application can use either
MFX_MEMTYPE_VIDEO_MEMORY_DECODER_TARGET or
MFX_MEMTYPE_VIDEO_MEMORY_PROCESSOR_TARGET to indicate data in video memory.

Table 8: Supported SDK Surface Types and Color Formats for VA API shows supported by VA API color formats.

Memory Allocation and External Allocators

All SDK implementations delegate memory management to the application. The application must allocate sufficient
memory for input and output parameters and buffers, and de-allocate it when SDK functions complete their
operations. During execution, the SDK functions use callback functions to the application to manage memory for
video frames through external allocator interface mfxFrameAllocator.

mfxBufferAllocator interface is deprecated.

If an application needs to control the allocation of video frames, it can use callback functions through the
mfxFrameAllocator interface. If an application does not specify an allocator, an internal allocator is used. However,
if an application uses video memory surfaces for input and output, it must specify the hardware acceleration device
and an external frame allocator using mfxFrameAllocator.

The external frame allocator can allocate different frame types:

- in system memory and
- in video memory, as “decoder render targets” or “processor render targets.” See the section Working with
  hardware acceleration for additional details.

The external frame allocator responds only to frame allocation requests for the requested memory type and
returns MFX_ERR_UNSUPPORTED for all others. The allocation request uses flags, part of memory type field, to
indicate which SDK class initiates the request, so the external frame allocator can respond accordingly. Example 12
illustrates a simple external frame allocator.

Example 12: Example Frame Allocator
typedef struct {
    mfxU16 width, height;
    mfxU8 *base;
} mid_struct;

mfxStatus fa_alloc(mfxHDL pthis, mfxFrameAllocRequest *request, mfxFrameAllocResponse *response) {
    if (!(request->type&MFX_MEMTYPE_SYSTEM_MEMORY))
        return MFX_ERR_UNSUPPORTED;
    if (request->Info->FourCC!=MFX_FOURCC_NV12)
        return MFX_ERR_UNSUPPORTED;
    response->NumFrameActual=request->NumFrameMin;
    for (int i=0;i<request->NumFrameMin;i++) {
        mid_struct *mmid=(mid_struct *)malloc(sizeof(mid_struct));
        mmid->width=ALIGN32(request->Info->Width);
        mmid->height=ALIGN32(request->Info->Height);
        mmid->base=(mfxU8*)malloc(mmid->width*mmid->height*3/2);
        response->mids[i]=mmid;
    }
    return MFX_ERR_NONE;
}

mfxStatus fa_lock(mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr) {
    mid_struct *mmid=(mid_struct *)mid;
    ptr->pitch=mmid->width;
    ptr->Y=mmid->base;
    ptr->U=ptr->Y+mmid->width*mmid->height;
    ptr->V=ptr->U+1;
    return MFX_ERR_NONE;
}

mfxStatus fa_unlock(mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr) {
    if (ptr) ptr->Y=ptr->U=ptr->V=ptr->A=0;
    return MFX_ERR_NONE;
}

mfxStatus fa_gethdl(mfxHDL pthis, mfxMemId mid, mfxHDL *handle) {
    return MFX_ERR_UNSUPPORTED;
}

mfxStatus fa_free(mfxHDL pthis, mfxFrameAllocResponse *response) {
    for (int i=0;i<response->NumFrameActual;i++) {
        mid_struct *mmid=(mid_struct *)response->mids[i];
        free(mmid->base); free(mmid);
    }
    return MFX_ERR_NONE;
}

For system memory, it is highly recommended to allocate memory for all planes of the same frame as a single buffer (using one single malloc call).

**Surface Type Neutral Transcoding**

Performance wise, software SDK library (running CPU instructions) prefers system memory I/O, and SDK platform implementation (accelerated by platform graphic devices) prefers video memory surface I/O. The application needs to manage both surface types (thus two data paths in a transcoding AB) to achieve the best performance in both cases.

The SDK provides a third surface type: opaque surface. With opaque surface, the SDK will map the surface type to either system memory buffer or video memory surface at runtime. The application only needs to manage one surface type, or one transcoding data path.

It is recommended the application use opaque surfaces for any transcoding intermediate data. For example, the transcoding pipeline can be **DECODE** Opaque Surfaces **VPP** Opaque Surfaces **ENCODE**. It is possible to copy an opaque surface to a "real" surface through a **VPP** operation.

The application uses the following procedure to use opaque surface, assuming a transcoding pipeline **SDK A -> SDK B**:

- As described in section **Surface Pool Allocation**, the application queries SDK component A and B and calculates the surface pool size. The application needs to use **MFX_IOPATTERN_IN_OPAQUE_MEMORY** and/or **MFX_IOPATTERN_OUT_OPAQUE_MEMORY** while specifying the I/O pattern. It is possible that SDK component A returns a different memory type than SDK component B, as the **QueryIOSurf** function returns the native allocation type and size. In this case, the surface pool type and size should follow only one SDK component: either A or B.
- The application allocates the surface pool, which is an array of the **mfxFrameSurface1** structures. Within the structure, specify **Data.Y= Data.U= Data.V= Data.A= Data.MemId=0** for all array members.
During initialization, the application communicates the allocated surface pool to both SDK components by attaching the `mfxExtOpaqueSurfaceAlloc` structure as part of the initialization parameters. The application needs to use `MFX_IOPATTERN_IN_OPAQUE_MEMORY` and/or `MFX_IOPATTERN_OUT_OPAQUE_MEMORY` while specifying the I/O pattern.

During decoding, encoding, and video processing, the application manages the surface pool and passes individual frame surface to SDK component A and B as described in section Decoding Procedures, section Encoding Procedures, and section Video Processing Procedures, respectively.

Example 13 shows the opaque procedure sample code.

Since the SDK manages the association of opaque surface to “real” surface types internally, the application cannot read the content of opaque surfaces. Also the application does not get any opaque-type surface allocation requests if the application specifies an external frame allocator.

If the application shares opaque surfaces among different SDK sessions, the application must join the sessions before SDK component initialization and ensure that all joined sessions have the same hardware acceleration device handle. Setting device handle is optional only if all components in pipeline belong to the same session. The application should not disjoin the session which share opaque memory until the SDK components are not closed.

**Example 13: Pseudo-Code of Opaque Surface Procedure**

```c
mfxExtOpqueSurfaceAlloc osa, *posa=&osa;
memset(&osa, 0, sizeof(osa));
// query frame surface allocation needs
MFXVideoDECODE_QueryIOSurf(session, &decode_param, &request_decode);
MFXVideoENCODE_QueryIOSurf(session, &encode_param, &request_encode);

// calculate the surface pool surface type and numbers
if (MFX_MEMTYPE_BASE(request_decode.Type) ==
    MFX_MEMTYPE_BASE(request_encode.Type)) {
    request_encode.NumFrameSuggested - decode_param.AsyncDepth;
    osa.Out.Type = request_decode.Type;
} else {  // it is also ok to use decode's NumFrameSuggested and Type.
    osa.Out.Type = request_encode.Type;
}

// allocate surface pool and zero MemId/Y/U/V/A pointers
osa.Out.Surfaces = allocmfxFrameSurface(osa.Out.NumSurface);
osa.Header.BufferId = MFX_EXTBUFF_OPAQUE_SURFACE_ALLOCATION;
osa.Header.BufferSz = sizeof(osa);
decode_param.NumExtParam = 1;
decode_param.ExtParam = &posa;
MFXVideoDECODE_Init(session, &decode_param);
memcpy(&osa.In, &osa.Out, sizeof(osa.Out));
encode_param.NumExtParam = 1;
encode_param.ExtParam = &posa;
MFXVideoENCODE_Init(session, &encode_param);
```

**Hardware Device Error Handling**

The SDK accelerates decoding, encoding and video processing through a hardware device. The SDK functions may return the following errors or warnings if the hardware device encounters errors:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_DEVICE_FAILED</td>
<td>Hardware device returned unexpected errors. SDK was unable to restore operation.</td>
</tr>
<tr>
<td>MFX_ERR_DEVICE_LOST</td>
<td>Hardware device was lost due to system lock or shutdown.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The hardware does not fully support the specified configuration. The encoding, decoding, or video processing operation may be partially accelerated.</td>
</tr>
<tr>
<td>MFX_WRN_DEVICE_BUSY</td>
<td>Hardware device is currently busy.</td>
</tr>
</tbody>
</table>

SDK functions `Query`, `QueryIOSurf`, and `Init` return `MFX_WRN_PARTIAL_ACCELERATION` to indicate that the encoding, decoding or video processing operation can be partially hardware accelerated or not hardware accelerated at all. The application can ignore this warning and proceed with the operation. (Note that SDK functions may return errors or other warnings overwriting `MFX_WRN_PARTIAL_ACCELERATION`, as it is a lower priority warning.)

SDK functions return `MFX_WRN_DEVICE_BUSY` to indicate that the hardware device is busy and unable to take commands at this time. Resume the operation by waiting for a few milliseconds and resubmitting the request. Example 14 shows the decoding pseudo-code. The same procedure applies to encoding and video processing.
SDK functions return `MFX_ERR_DEVICE_LOST` or `MFX_ERR_DEVICE_FAILED` to indicate that there is a complete failure in hardware acceleration. The application must close and reinitialize the SDK function class. If the application has provided a hardware acceleration device handle to the SDK, the application must reset the device.

**Example 14: Pseudo-Code to Handle MFX_ERR_DEVICE_BUSY**

```c
mfxStatus sts=MFX_ERR_NONE;
for (;;) {
  ... 
  sts=MFXVideoDECODE_DecodeFrameAsync(session, bitstream, surface_work, &surface_disp, &asyncp);
  if (sts == MFX_WRN_DEVICE_BUSY) Sleep(5);
}
```

**Function Reference**

This section describes SDK functions and their operations.

In each function description, only commonly used status codes are documented. The function may return additional status codes, such as `MFX_ERR_INVALID_HANDLE` or `MFX_ERR_NULL_PTR`, in certain case. See the `mfxStatus` enumerator for a list of all status codes.

**Global Functions**

Global functions initialize and de-initialize the SDK library and perform query functions on a global scale within an application.

<table>
<thead>

</tbody>
</table>

**MFXCloneSession**

**Syntax**

```c
mfxStatus MFXCloneSession(mfxSession session, mfxSession *clone);
```

**Parameters**

- `session`: SDK session handle
- `clone`: Pointer to the cloned session handle

**Description**

This function creates a clean copy of the current session. The cloned session is an independent session. It does not inherit any user-defined buffer, frame allocator, or device manager handles from the current session. This function is a light-weight equivalent of `MFXJoinSession` after `MFXInit`.

**Return Status**

- `MFX_ERR_NONE`: The function completed successfully.

**Change History**

This function is available since SDK API 1.1.

**MFXClose**

**Syntax**

```c
mfxStatus MFXClose(mfxSession session);
```

**Parameters**

- `session`: SDK session handle

**Description**

This function completes and de-initializes an SDK session. Any active tasks in execution or in queue are aborted. The application cannot call any SDK function after this function.

All child sessions must be disjoined before closing a parent session.
MFXDoWork

Syntax

```c
mfxStatus MFXDoWork(mfxSession session);
```

Parameters

- `session`: SDK session handle

Description

This function complements `MFXInitEx` with external threading mode on. Application expected to create no less than two work threads per session and pass them to SDK via this function. This function won't return control to application unless session is closed.

In case of joined sessions, application should call `MFXDoWork` only for parent session.

Return Status

- `MFX_ERR_NONE`: The function completed successfully.

Change History

This function is available since SDK API 1.0.

MFXDisjoinSession

Syntax

```c
mfxStatus MFXDisjoinSession(mfxSession session);
```

Parameters

- `session`: SDK session handle

Description

This function removes the joined state of the current session. After disjoining, the current session becomes independent. The application must ensure there is no active task running in the session before calling this function.

Return Status

- `MFX_ERR_NONE`: The function completed successfully.
- `MFX_WRN_IN_EXECUTION`: Active tasks are in execution or in queue. Wait for the completion of the tasks and then call this function again.
- `MFX_ERR_UNDEFINED_BEHAVIOR`: The session is independent, or this session is the parent of all joined sessions.

Change History

This function is available since SDK API 1.1.

MFXGetPriority

Syntax

```c
mfxStatus MFXGetPriority(mfxSession session, mfxPriority *priority);
```

Parameters

- `session`: SDK session handle
- `priority`: Pointer to the priority value

Description

This function returns the current session priority.

Return Status

- `MFX_ERR_NONE`: The function completed successfully.

Change History

This function is available since SDK API 1.1.
MFXInit
Syntax
mfxStatus MFXInit(mfxIMPL impl, mfxVersion *ver, mfxSession *session);

Parameters
| impl  | mfxIMPL enumerator that indicates the desired SDK implementation |
| ver   | Pointer to the minimum library version or zero, if not specified |
| session | Pointer to the SDK session handle |

Description
This function creates and initializes an SDK session. Call this function before calling any other SDK functions. If the desired implementation specified by impl is MFX_IMPL_AUTO, the function will search for the platform-specific SDK implementation. If the function cannot find it, it will use the software implementation.

The argument ver indicates the desired version of the library implementation. The loaded SDK will have an API version compatible to the specified version (equal in the major version number, and no less in the minor version number.) If the desired version is not specified, the default is to use the API version from the SDK release, with which an application is built.

We recommend that production applications always specify the minimum API version that meets their functional requirements. For example, if an application uses only H.264 decoding as described in API v1.0, have the application initialize the library with API v1.0. This ensures backward compatibility.

Return Status
| MFX_ERR_NONE | The function completed successfully. The output parameter contains the handle of the session. |
| MFX_ERR_UNSUPPORTED | The function cannot find the desired SDK implementation or version. |

Change History
This function is available since SDK API 1.0.

MFXInitEx
Syntax
mfxStatus MFXInitEx(mfxInitParam par, mfxSession *session);

Parameters
| par  | mfxInitParam structure that indicates the desired SDK implementation, minimum library version and desired threading mode |
| session | Pointer to the SDK session handle |

Description
This function creates and initializes an SDK session. Call this function before calling any other SDK functions. If the desired implementation specified by par. Implementation is MFX_IMPL_AUTO, the function will search for the platform-specific SDK implementation. If the function cannot find it, it will use the software implementation.

The argument par.Version indicates the desired version of the library implementation. The loaded SDK will have an API version compatible to the specified version (equal in the major version number, and no less in the minor version number.) If the desired version is not specified, the default is to use the API version from the SDK release, with which an application is built.

We recommend that production applications always specify the minimum API version that meets their functional requirements. For example, if an application uses only H.264 decoding as described in API v1.0, have the application initialize the library with API v1.0. This ensures backward compatibility.

The argument par.ExternalThreads specifies threading mode. Value 0 means that SDK should internally create and handle work threads (this essentially equivalent of regular MFXInit). If this parameter set to 1 then SDK will expect that application should create work threads and pass them to SDK via single-entry function MFXDoWork. Setting par.ExternalThreads to 1 requires setting minimum API version to 1.14, as previous versions of SDK didn’t have such functionality.

Return Status
| MFX_ERR_NONE | The function completed successfully. The output parameter contains the handle of the session. |
| MFX_ERR_UNSUPPORTED | The function cannot find the desired SDK implementation or version. |

Change History
This function is available since SDK API 1.14.

MFXJoinSession
Syntax
```
mfxStatus MFXJoinSession(mfxSession session, mfxSession child);
```

**Parameters**
- `session` The current session handle
- `child` The child session handle to be joined

**Description**
This function joins the child session to the current session. After joining, the two sessions share thread and resource scheduling for asynchronous operations. However, each session still maintains its own device manager and buffer/frame allocator. Therefore, the application must use a compatible device manager and buffer/frame allocator to share data between two joined sessions.

The application can join multiple sessions by calling this function multiple times. When joining the first two sessions, the current session becomes the parent responsible for thread and resource scheduling of any later joined sessions.

Joining of two parent sessions is not supported.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.
- **MFX_WRN_IN_EXECUTION** Active tasks are executing or in queue in one of the sessions. Call this function again after all tasks are completed.
- **MFX_ERR_UNSUPPORTED** The child session cannot be joined with the current session.

**Change History**
This function is available since SDK API 1.1.

---

**MFXQueryIMPL**

**Syntax**
```
mfxStatus MFXQueryIMPL(mfxSession session, mfxIMPL *impl);
```

**Parameters**
- `session` SDK session handle
- `impl` Pointer to the implementation type

**Description**
This function returns the implementation type of a given session.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.

**Change History**
This function is available since SDK API 1.0.

---

**MFXQueryVersion**

**Syntax**
```
mfxStatus MFXQueryVersion(mfxSession session, mfxVersion *version);
```

**Parameters**
- `session` SDK session handle
- `version` Pointer to the returned implementation version

**Description**
This function returns the SDK implementation version.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.

**Change History**
This function is available since SDK API 1.0.

---

**MFXSetPriority**

**Syntax**
```
mfxStatus MFXSetPriority(mfxSession session, mfxPriority priority);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>priority</td>
<td>Priority value</td>
</tr>
</tbody>
</table>

Description
This function sets the current session priority.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.1.

**MFXVideoCORE**

This class of functions consists of auxiliary functions that all functions of the SDK implementation can call.

Member Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFXVideoCORE_SetHandle</td>
<td>Sets system handles that the SDK implementation might need</td>
</tr>
<tr>
<td>MFXVideoCORE_GetHandle</td>
<td>Obtains system handles previously set</td>
</tr>
<tr>
<td>MFXVideoCORE_SetBufferAllocator</td>
<td>Sets the external system buffer allocator</td>
</tr>
<tr>
<td>MFXVideoCORE_SetFrameAllocator</td>
<td>Sets the external frame allocator</td>
</tr>
<tr>
<td>MFXVideoCORE_SyncOperation</td>
<td>Initializes execution of the specified sync point and returns a status code</td>
</tr>
</tbody>
</table>

**MFXVideoCORE_SetHandle**

Syntax

```c
mfxStatus MFXVideoCORE_SetHandle(mfxSession session, mfxHandleType type, mfxHDL hdl);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>type</td>
<td>Handle type</td>
</tr>
<tr>
<td>hdl</td>
<td>Handle to be set</td>
</tr>
</tbody>
</table>

Description
This function sets any essential system handle that SDK might use. If the specified system handle is a COM interface, the reference counter of the COM interface will increase. The counter will decrease when the SDK session closes.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_UNDEFINED_BEHAVIOR</td>
<td>The same handle is redefined. For example, the function has been called twice with the same handle type or internal handle has been created by the SDK before this function call.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

**MFXVideoCORE_GetHandle**

Syntax

```c
mfxStatus MFXVideoCORE_GetHandle(mfxSession session, mfxHandleType type, mfxHDL *hdl);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>type</td>
<td>Handle type</td>
</tr>
<tr>
<td>hdl</td>
<td>Pointer to the handle to be set</td>
</tr>
</tbody>
</table>

Description
This function obtains system handles previously set by the MFXVideoCORE_SetHandle function. If the handler is a COM interface, the reference counter of the interface increases. The calling application must release the COM interface.

Return Status
**MFX_ERR_NONE** The function completed successfully.

**MFX_ERR_NOT_FOUND** Specified handle type not found.

**Change History**
This function is available since SDK API 1.0.

**MFXVideoCORE_SetBufferAllocator**

**Syntax**
mfxStatus MFXVideoCORE_SetBufferAllocator(mfxSession session, mfxBufferAllocator *allocator);

**Parameters**
- **session** SDK session handle
- **allocator** Pointer to the mfxBufferAllocator structure

**Description**
This function is deprecated.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.

**Change History**
This function is available since SDK API 1.0.

Deprecated since SDK API 1.17.

**MFXVideoCORE_SetFrameAllocator**

**Syntax**
mfxStatus MFXVideoCORE_SetFrameAllocator(mfxSession session, mfxFrameAllocator *allocator);

**Parameters**
- **session** SDK session handle
- **allocator** Pointer to the mfxFrameAllocator structure

**Description**
This function sets the external allocator callback structure for frame allocation. If the allocator argument is NULL, the SDK uses the default allocator, which allocates frames from system memory or hardware devices.

The behavior of the SDK is undefined if it uses this function while the previous allocator is in use. A general guideline is to set the allocator immediately after initializing the session.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.

**Change History**
This function is available since SDK API 1.0.

**MFXVideoCORE_QueryPlatform**

**Syntax**
mfxStatus MFXVideoCORE_QueryPlatform(mfxSession session, mfxPlatform *platform);

**Parameters**
- **session** SDK session handle
- **platform** Pointer to the mfxPlatform structure

**Description**
This function returns information about current hardware platform.

**Return Status**
- **MFX_ERR_NONE** The function completed successfully.

**Change History**
This function is available since SDK API 1.19.
Syntax
mfxStatus MFXVideoCORE_SyncOperation(mfxSession session, mfxSyncPoint syncp, mfxU32 wait);

Parameters
<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>syncp</td>
<td>Sync point</td>
</tr>
<tr>
<td>wait</td>
<td>Wait time in milliseconds</td>
</tr>
</tbody>
</table>

Description
This function initiates execution of an asynchronous function not already started and returns the status code after the specified asynchronous operation completes. If wait is zero, the function returns immediately.

Return Status
<table>
<thead>
<tr>
<th>status code</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_WRN_IN_EXECUTION</td>
<td>The specified asynchronous function is in execution.</td>
</tr>
<tr>
<td>MFX_ERR_ABORTED</td>
<td>The specified asynchronous function aborted due to data dependency on a previous asynchronous function that did not complete.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

Remarks
See status codes for specific asynchronous functions.

MFXVideoENCODE
This class of functions performs the entire encoding pipeline from the input video frames to the output bitstream.

Member Functions
- MFXVideoENCODE_Query: Queries the feature capability
- MFXVideoENCODE_QueryIOSurf: Queries the number of input surface frames required for encoding
- MFXVideoENCODE_Init: Initializes the encoding operation
- MFXVideoENCODE_Reset: Resets the current encoding operation and prepares for the next encoding operation
- MFXVideoENCODE_Close: Terminates the encoding operation and de-allocates any internal memory
- MFXVideoENCODE_GetVideoParam: Obtains the current working parameter set
- MFXVideoENCODE_GetEncodeStat: Obtains the statistics collected during encoding
- MFXVideoENCODE_EncodeFrameAsync: Performs the encoding and returns the compressed bitstream

MFXVideoENCODE_Query
Syntax
mfxStatus MFXVideoENCODE_Query(mfxSession session, mfxVideoParam *in, mfxVideoParam *out);

Parameters
<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>in</td>
<td>Pointer to the mfxVideoParam structure as input</td>
</tr>
<tr>
<td>out</td>
<td>Pointer to the mfxVideoParam structure as output</td>
</tr>
</tbody>
</table>

Description
This function works in either of four modes:
If the in pointer is zero, the function returns the class configurability in the output structure. A non-zero value in each field of the output structure indicates that the SDK implementation can configure the field with Init.
If the in parameter is non-zero, the function checks the validity of the fields in the input structure. Then the function returns the corrected values in the output structure. If there is insufficient information to determine the validity or correction is impossible, the function zeroes the fields. This feature can verify whether the SDK implementation supports certain profiles, levels or bitrates.
If the in parameter is non-zero and mfxExtEncoderResetOption structure is attached to it, then the function queries for the outcome of the MFXVideoENCODE_Reset function and returns it in the mfxExtEncoderResetOption structure attached to out. The query function succeeds if such reset is possible and returns error otherwise. Unlike other modes that are independent of the SDK encoder state, this one checks if reset is possible in the present SDK encoder state. This mode also requires completely defined mfxVideoParam structure, unlike other modes that support partially defined configurations. See mfxExtEncoderResetOption description for more details.
If the in parameter is non-zero and mfxExtEncoderCapability structure is attached to it, then the function returns encoder capability in mfxExtEncoderCapability structure attached to out. It is recommended to fill in mfxVideoParam structure and set hardware acceleration device handle before calling the function in this mode.
The application can call this function before or after it initializes the encoder. The CodecId field of the output structure is a mandated field (to be filled by the application) to identify the coding standard.

**Return Status**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_UNSUPPORTED</td>
<td>The function failed to identify a specific implementation for the required features.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The underlying hardware does not fully support the specified video parameters; The encoding may be partially accelerated. Only SDK HW implementations may return this status code.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

**Change History**

This function is available since SDK API 1.0.

**MFXVideoENCODE_QueryIOSurf**

**Syntax**

```c
mfxStatus MFXVideoENCODE_QueryIOSurf(mfxSession session, mfxVideoParam *par, mfxFrameAllocRequest *request);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure as input</td>
</tr>
<tr>
<td>request</td>
<td>Pointer to the mfxFrameAllocRequest structure as output</td>
</tr>
</tbody>
</table>

**Description**

This function returns minimum and suggested numbers of the input frame surfaces required for encoding initialization and their type. Init will call the external allocator for the required frames with the same set of numbers.

The use of this function is recommended. For more information, see the section Working with hardware acceleration.

This function does not validate I/O parameters except those used in calculating the number of input surfaces.

**Return Status**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The underlying hardware does not fully support the specified video parameters. The encoding may be partially accelerated. Only SDK HW implementations may return this status code.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

**Change History**

This function is available since SDK API 1.0.

**MFXVideoENCODE_Init**

**Syntax**

```c
mfxStatus MFXVideoENCODE_Init(mfxSession session, mfxVideoParam *par);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure</td>
</tr>
</tbody>
</table>

**Description**

This function allocates memory and prepares tables and necessary structures for encoding. This function also does extensive validation to ensure if the configuration, as specified in the input parameters, is supported.

**Return Status**

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>
The underlying hardware does not fully support the specified video parameters. The encoding may be partially accelerated. Only SDK HW implementations may return this status code.

The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.

The function detected some video parameters were incompatible with others; incompatibility resolved.

The function is called twice without a close;

Change History
This function is available since SDK API 1.0.

**MFXVideoENCODE_Reset**

Syntax

```c
mfxStatus MFXVideoENCODE_Reset(mfxSession session, mfxVideoParam *par);
```

Parameters

- `session`: SDK session handle
- `par`: Pointer to the `mfxVideoParam` structure

Description

This function stops the current encoding operation and restores internal structures or parameters for a new encoding operation, possibly with new parameters.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected that video parameters are wrong or they conflict with initialization parameters. Reset is impossible.</td>
</tr>
<tr>
<td>MFX_ERR_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected that provided by the application video parameters are incompatible with initialization parameters. Reset requires additional memory allocation and cannot be executed. The application should close the SDK component and then reinitialize it.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

**MFXVideoENCODE_Close**

Syntax

```c
mfxStatus MFXVideoENCODE_Close(mfxSession session);
```

Parameters

- `session`: SDK session handle

Description

This function terminates the current encoding operation and de-allocates any internal tables or structures.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

**MFXVideoENCODE_GetVideoParam**

Syntax

```c
mfxStatus MFXVideoENCODE_GetVideoParam(mfxSession session, mfxVideoParam *par);
```

Parameters

- `session`: SDK session handle
- `par`: Pointer to the corresponding parameter structure

Description

This function retrieves current working parameters to the specified output structure. If extended buffers are to be...
returned, the application must allocate those extended buffers and attach them as part of the output structure. The application can retrieve a copy of the bitstream header, by attaching the `mfxExtCodingOptionSPSPPS` structure to the `mfxVideoParam` structure.

**Returned information**

MFX_ERR_NONE The function completed successfully.

**Change History**

This function is available since SDK API 1.0.

### MFXVideoENCODE_GetEncodeStat

**Syntax**

```c
mfxStatus MFXVideoENCODE_GetEncodeStat(mfxSession session, mfxEncodeStat *stat);
```

**Parameters**

- `session`: SDK session handle
- `stat`: Pointer to the `mfxEncodeStat` structure

**Description**

This function obtains statistics collected during encoding.

**Return Status**

MFX_ERR_NONE The function completed successfully.

**Change History**

This function is available since SDK API 1.0.

### MFXVideoENCODE_EncodeFrameAsync

**Syntax**

```c
mfxStatus MFXVideoENCODE_EncodeFrameAsync(mfxSession session, mfxEncodeCtrl *ctrl, mfxFrameSurface1 *surface, mfxBitstream *bs, mfxSyncPoint *syncp);
```

**Parameters**

- `Session`: SDK session handle
- `ctrl`: Pointer to the `mfxEncodeCtrl` structure for per-frame encoding control; this parameter is optional (it can be `NULL`) if the encoder works in the display order mode.
- `surface`: Pointer to the frame surface structure
- `bs`: Pointer to the output bitstream
- `syncp`: Pointer to the returned sync point associated with this operation

**Description**

This function takes a single input frame in either encoded or display order and generates its output bitstream. In the case of encoded ordering the `mfxEncodeCtrl` structure must specify the explicit frame type. In the case of display ordering, this function handles frame order shuffling according to the GOP structure parameters specified during initialization.

Since encoding may process frames differently from the input order, not every call of the function generates output and the function returns MFX_ERR_MORE_DATA. If the encoder needs to cache the frame, the function locks the frame. The application should not alter the frame until the encoder unlocks the frame. If there is output (with return status MFX_ERR_NONE), the return is a frame worth of bitstream.

It is the calling application's responsibility to ensure that there is sufficient space in the output buffer. The value `BufferSizeInKB` in the `mfxVideoParam` structure at encoding initialization specifies the maximum possible size for any compressed frames. This value can also be obtained from `MFXVideoENCODE_GetVideoParam` after encoding initialization.

To mark the end of the encoding sequence, call this function with a `NULL` surface pointer. Repeat the call to drain any remaining internally cached bitstreams (one frame at a time) until MFX_ERR_MORE_DATA is returned.

This function is asynchronous.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_NOT_ENOUGH_BUFFER</td>
<td>The bitstream buffer size is insufficient.</td>
</tr>
<tr>
<td>MFX_ERR_MORE_DATA</td>
<td>The function requires more data to generate any output.</td>
</tr>
<tr>
<td>MFX_ERR_DEVICE_LOST</td>
<td>Hardware device was lost; See <em>Working with Microsoft</em> DirectX* Applications* section for further information.</td>
</tr>
</tbody>
</table>
Change History
This function is available since SDK API 1.0.

Remarks
If the EncodedOrder field in the mfxInfoMFX structure is true, input frames enter the encoder in the order of their encoding. However, the FrameOrder field in the mfxFrameData structure of each frame must be set to the display order. If EncodedOrder is false, the function ignores the FrameOrder field.

MFXVideoENC
This class of functions performs the first step of encoding process – motion estimation, intra prediction and mode decision. These functions are declared in mfxenc.h file.

Member Functions
- MFXVideoENC_Query: Queries the feature capability
- MFXVideoENC_QueryIOSurf: Queries the number of input surface frames required for encoding
- MFXVideoENC_Init: Initializes the encoding operation
- MFXVideoENC_Reset: Resets the current encoding operation and prepares for the next encoding operation
- MFXVideoENC_Close: Terminates the encoding operation and de-allocates any internal memory
- MFXVideoENC_ProcessFrameAsync: Performs the first step of encoding process and returns intermediate data.

MFXVideoENC_Query
Syntax
mfxStatus MFXVideoENC_Query(mfxSession session, mfxVideoParam *in, mfxVideoParam *out);

Parameters
- session: SDK session handle
- in: Pointer to the mfxVideoParam structure as input
- out: Pointer to the mfxVideoParam structure as output

Description
This function works in either of two modes:
If the in pointer is zero, the function returns the class configurability in the output structure. A non-zero value in each field of the output structure indicates that the SDK implementation can configure the field with Init.

If the in parameter is non-zero, the function checks the validity of the fields in the input structure. Then the function returns the corrected values in the output structure. If there is insufficient information to determine the validity or correction is impossible, the function zeroes the fields. This feature can verify whether the SDK implementation supports certain profiles, levels or bitrates.

The application can call this function before or after it initializes the ENC.

Return Status
- MFX_ERR_NONE: The function completed successfully.
- MFX_ERR_UNSUPPORTED: The function failed to identify a specific implementation for the required features.
- MFX_WRN_INCOMPATIBLE_VIDEO_PARAM: The function detected some video parameters were incompatible with others; incompatibility resolved.

Change History
This function is available since SDK API 1.10.

MFXVideoENC_QueryIOSurf
Syntax
mfxStatus MFXVideoENC_QueryIOSurf(mfxSession session, mfxVideoParam *par, mfxFrameAllocRequest *request);

Parameters
- session: SDK session handle
- par: Pointer to the mfxVideoParam structure as input
- request: Pointer to the mfxFrameAllocRequest structure as output
Description
This function returns minimum and suggested numbers of the input frame surfaces required for ENC initialization and their type.

This function does not validate I/O parameters except those used in calculating the number of input surfaces.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.10.

MFXVideoENC_Init

Syntax

```c
mfxStatus MFXVideoENC_Init(mfxSession session, mfxVideoParam *par);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure</td>
</tr>
</tbody>
</table>

Description
This function performs ENC initialization.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.10.

MFXVideoENC_Reset

Syntax

```c
mfxStatus MFXVideoENC_Reset(mfxSession session, mfxVideoParam *par);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure</td>
</tr>
</tbody>
</table>

Description
This function stops the current encoding operation and restores internal structures or parameters for a new encoding operation, possibly with new parameters.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected that video parameters are wrong or they conflict with initialization parameters. Reset is impossible.</td>
</tr>
<tr>
<td>MFX_ERR_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected that provided by the application video parameters are incompatible with initialization parameters. Reset requires additional memory allocation and cannot be executed. The application should close the SDK component and then reinitialize it.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.10.
MFXVideoENC_Close

**Syntax**

```c
mfxStatus MFXVideoENC_Close(mfxSession session);
```

**Parameters**

- **session** SDK session handle

**Description**

This function terminates the current encoding operation and de-allocates any internal tables or structures.

**Return Status**

- **MFX_ERR_NONE** The function completed successfully.

**Change History**

This function is available since SDK API 1.10.

MFXVideoENC_GetVideoParam

**Syntax**

```c
mfxStatus MFXVideoENC_GetVideoParam(mfxSession session, *par);
```

**Parameters**

- **session** SDK session handle
- **par** Pointer to the corresponding parameter structure

**Description**

This function retrieves current working parameters to the specified output structure. If extended buffers are to be returned, the application must allocate those extended buffers and attach them as part of the output structure.

**Returned information**

- **MFX_ERR_NONE** The function completed successfully.

**Change History**

This function is available since SDK API 1.19.

MFXVideoENC_ProcessFrameAsync

**Syntax**

```c
mfxStatus MFXVideoENC_ProcessFrameAsync(mfxSession session, mfxENCInput *in,
                                         mfxENCOutput *out, mfxSyncPoint *syncp);
```

**Parameters**

- **session** SDK session handle
- **in** Input parameters for ENC operation.
- **out** Output parameters of encoding operation.
- **syncp** Pointer to the returned sync point associated with this operation

**Description**

This function performs the first step of encoding process – motion estimation, intra prediction and mode decision. Its exact operation, input and output parameters depend on usage model.

This function is stateless, i.e. each function call is independent from other calls.

This function is asynchronous.

**Return Status**

- **MFX_ERR_NONE** The function completed successfully.

**Change History**

This function is available since SDK API 1.10.

MFXVideoDECODE

This class of functions implements a complete decoder that decompresses input bitstreams directly to output frame surfaces.
### Member Functions

#### MFXVideoDECODE_DecodeHeader

**Syntax**

```c
mfxStatus MFXVideoDECODE_DecodeHeader(mfxSession session, mfxBitstream *bs, mfxVideoParam *par);
```

**Parameters**

- **session**: SDK session handle
- **bs**: Pointer to the bitstream
- **par**: Pointer to the `mfxVideoParam` structure

**Description**

This function parses the input bitstream and fills the `mfxVideoParam` structure with appropriate values, such as resolution and frame rate, for the `Init` function. The application can then pass the resulting structure to the `MFXVideoDECODE_Init` function for decoder initialization.

An application can call this function at any time before or after decoder initialization. If the SDK finds a sequence header in the bitstream, the function moves the bitstream pointer to the first bit of the sequence header. Otherwise, the function moves the bitstream pointer close to the end of the bitstream buffer but leaves enough data in the buffer to avoid possible loss of start code.

The `CodecId` field of the `mfxVideoParam` structure is a mandated field (to be filled by the application) to identify the coding standard.

The application can retrieve a copy of the bitstream header, by attaching the `mfxExtCodingOptionSPSPPS` structure to the `mfxVideoParam` structure.

**Return Status**

- **MFX_ERR_NONE**: The function successfully filled structure. It does not mean that the stream can be decoded by SDK. The application should call `MFXVideoDECODE_Query` function to check if decoding of the stream is supported.
- **MFX_ERR_MORE_DATA**: The function requires more bitstream data.

#### Change History

This function is available since SDK API 1.0.

#### MFXVideoDECODE_Query

**Syntax**

```c
mfxStatus MFXVideoDECODE_Query(mfxSession session, mfxVideoParam *in, mfxVideoParam *out);
```

**Parameters**

- **session**: SDK session handle
- **in**: Pointer to the `mfxVideoParam` structure as input
- **out**: Pointer to the `mfxVideoParam` structure as output

**Description**

This function works in one of two modes:

1. If the `in` pointer is zero, the function returns the class configurability in the output structure. A non-zero value in each field of the output structure indicates that the field is configurable by the SDK implementation with the `MFXVideoDECODE_Init` function).
2. If the `in` parameter is non-zero, the function checks the validity of the fields in the input structure. Then the function returns the corrected values to the output structure. If there is insufficient information to determine the validity or correction is impossible, the function zeros the fields. This feature can verify whether the SDK implementation supports certain profiles, levels or bitrates.
The application can call this function before or after it initializes the decoder. The CodecId field of the output structure is a mandated field (to be filled by the application) to identify the coding standard.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_UNSUPPORTED</td>
<td>The function failed to identify a specific implementation.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The underlying hardware does not fully support the specified video parameters; The decoding may be partially accelerated. Only SDK HW implementations may return this status code.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

**Change History**

This function is available since SDK API 1.0.

**MFXVideoDECODE_QueryIOSurf**

**Syntax**

```c
mfxStatus MFXVideoDECODE_QueryIOSurf(mfxSession session, mfxVideoParam *par, mfxFrameAllocRequest *request);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure as input</td>
</tr>
<tr>
<td>request</td>
<td>Pointer to the mfxFrameAllocRequest structure as output</td>
</tr>
</tbody>
</table>

**Description**

The function returns minimum and suggested numbers of the output frame surfaces required for decoding initialization and their type. **Init** will call the external allocator for the required frames with the same set of numbers.

The use of this function is recommended. For more information, see the section Working with hardware acceleration.

The CodecId field of the mfxVideoParam structure is a mandated field (to be filled by the application) to identify the coding standard.

This function does not validate I/O parameters except those used in calculating the number of output surfaces.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The underlying hardware does not fully support the specified video parameters; The decoding may be partially accelerated. Only SDK HW implementations may return this status code.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

**Change History**

This function is available since SDK API 1.0.

**MFXVideoDECODE_Init**

**Syntax**

```c
mfxStatus MFXVideoDECODE_Init(mfxSession session, mfxVideoParam *par);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the mfxVideoParam structure</td>
</tr>
</tbody>
</table>

**Description**

This function allocates memory and prepares tables and necessary structures for decoding. This function also does extensive validation to determine whether the configuration is supported as specified in the input parameters.

**Return Status**

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>
MFX_WRN_PARTIAL_ACCELERATION
The underlying hardware does not fully support the specified video parameters; The decoding may be partially accelerated. Only SDK hardware implementations return this status code.

MFX_ERR_INVALID_VIDEO_PARAM
The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of parameters resulted in an incompatibility error. Incompatibility was not resolved.

MFX_WRN_INCOMPATIBLE_VIDEO_PARAM
The function detected some video parameters were incompatible; Incompatibility resolved.

MFX_ERR_UNDEFINED_BEHAVIOR
The function is called twice without a close.

Change History
This function is available since SDK API 1.0.

MFXVideoDECODE_Reset
Syntax
mfxStatus MFXVideoDECODE_Reset(mfxSession session, mfxVideoParam *par);

Parameters
- **session**: SDK session handle
- **par**: Pointer to the mfxVideoParam structure

Description
This function stops the current decoding operation and restores internal structures or parameters for a new decoding operation. **Reset** serves two purposes:

- It recovers the decoder from errors.
- It restarts decoding from a new position.

The function resets the old sequence header (sequence parameter set in H.264, or sequence header in MPEG-2 and VC-1). The decoder will expect a new sequence header before it decodes the next frame and will skip any bitstream before encountering the new sequence header.

Return Status
- **MFX_ERR_NONE**: The function completed successfully.
- **MFX_ERR_INVALID_VIDEO_PARAM**: The function detected that video parameters are wrong or they conflict with initialization parameters. Reset is impossible.
- **MFX_ERR_INCOMPATIBLE_VIDEO_PARAM**: The function detected that provided by the application video parameters are incompatible with initialization parameters. Reset requires additional memory allocation and cannot be executed. The application should close the SDK component and then reinitialize it.
- **MFX_WRN_INCOMPATIBLE_VIDEO_PARAM**: The function detected some video parameters were incompatible; Incompatibility resolved.

Change History
This function is available since SDK API 1.0.

MFXVideoDECODE_Close
Syntax
mfxStatus MFXVideoDECODE_Close(mfxSession session);

Parameters
- **session**: SDK session handle

Description
This function terminates the current decoding operation and de-allocates any internal tables or structures.

Return Status
- **MFX_ERR_NONE**: The function completed successfully.

Change History
This function is available since SDK API 1.0.

MFXVideoDECODE_GetVideoParam
Syntax
mfxStatus MFXVideoDECODE_GetVideoParam(mfxSession session, mfxVideoParam *par);
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the corresponding parameter structure</td>
</tr>
</tbody>
</table>

Description

This function retrieves current working parameters to the specified output structure. If extended buffers are to be returned, the application must allocate those extended buffers and attach them as part of the output structure.

The application can retrieve a copy of the bitstream header, by attaching the `mfxExtCodingOptionSPSPPS` structure to the `mfxVideoParam` structure.

Return Status

- `MFX_ERR_NONE`: The function completed successfully.

Change History

This function is available since SDK API 1.0.

MFXVideoDECODE_GetDecodeStat

Syntax

```c
mfxStatus MFXVideoDECODE_GetDecodeStat(mfxSession session, mfxDecodeStat *stat);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>stat</td>
<td>Pointer to the <code>mfxDecodeStat</code> structure</td>
</tr>
</tbody>
</table>

Description

This function obtains statistics collected during decoding.

Return Status

- `MFX_ERR_NONE`: The function completed successfully.

Change History

This function is available since SDK API 1.0.

MFXVideoDECODE_GetPayload

Syntax

```c
mfxStatus MFXVideoDECODE_GetPayload(mfxSession session, mfxU64 *ts, mfxPayload *payload);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>ts</td>
<td>Pointer to the user data time stamp in units of 90 KHz; divide ts by 90,000 (90 KHz) to obtain the time in seconds; the time stamp matches the payload with a specific decoded frame.</td>
</tr>
<tr>
<td>payload</td>
<td>Pointer to the <code>mfxPayload</code> structure; the payload contains user data in MPEG-2 or SEI messages in H.264.</td>
</tr>
</tbody>
</table>

Description

This function extracts user data (MPEG-2) or SEI (H.264) messages from the bitstream. Internally, the decoder implementation stores encountered user data or SEI messages. The application may call this function multiple times to retrieve the user data or SEI messages, one at a time.

If there is no payload available, the function returns with `payload->NumBit=0`.

Return Status

- `MFX_ERR_NONE`: The function completed successfully and the output buffer is ready for decoding.
- `MFX_ERR_NOT_ENOUGH_BUFFER`: The payload buffer size is insufficient.

Change History

This function is available since SDK API 1.0.

MFXVideoDECODE_SetSkipMode

Syntax

```c
mfxStatus MFXVideoDECODE_SetSkipMode(mfxSession session, mfxSkipMode mode);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
</tbody>
</table>

Overview of the document:

This document provides details on various functions related to video decoding in the context of SDK API. It includes information on parameters, descriptions, return statuses, and change history for functions such as `MFXVideoDECODE_GetDecodeStat`, `MFXVideoDECODE_GetPayload`, and `MFXVideoDECODE_SetSkipMode`. Each function is described with its purpose, parameters, and return status, along with notes on availability and implementation details.
Decoder skip mode. See the \textit{mfxSkipMode} enumerator for details.

\textbf{Description}
This function sets the decoder skip mode. The application may use it to increase decoding performance by sacrificing output quality. The rising of skip level firstly results in skipping of some decoding operations like deblocking and then leads to frame skipping; firstly, B then P. Particular details are platform dependent.

\textbf{Return Status}
\begin{itemize}
\item \textbf{MFX_ERR_NONE} \hspace{1cm} The function completed successfully and the output surface is ready for decoding.
\item \textbf{MFX_WRN_VALUE_NOT_CHANGED} \hspace{1cm} The skip mode is not affected as the maximum or minimum skip range is reached.
\end{itemize}

\textbf{Change History}
This function is available since SDK API 1.0.

\textbf{MFXVideoDECODE_DecodeFrameAsync}

\textbf{Syntax}
\begin{verbatim}
mfxStatus MFXVideoDECODE_DecodeFrameAsync(mfxSession session, mfxBitstream *bs, mfxFrameSurface1 *surface_work, mfxFrameSurface1 **surface_out, mfxSyncPoint *syncp);
\end{verbatim}

\textbf{Parameters}
\begin{itemize}
\item \textbf{Session} \hspace{1cm} SDK session handle
\item \textbf{Bs} \hspace{1cm} Pointer to the input bitstream
\item \textbf{surface_work} \hspace{1cm} Pointer to the working frame buffer for the decoder
\item \textbf{surface_out} \hspace{1cm} Pointer to the output frame in the display order
\item \textbf{Syncp} \hspace{1cm} Pointer to the sync point associated with this operation
\end{itemize}

\textbf{Description}
This function decodes the input bitstream to a single output frame.

The \textit{surface_work} parameter provides a working frame buffer for the decoder. The application should allocate the working frame buffer, which stores decoded frames. If the function requires caching frames after decoding, the function locks the frames and the application must provide a new frame buffer in the next call.

If, and only if, the function returns \textbf{MFX_ERR_NONE}, the pointer \textit{surface_out} points to the output frame in the display order. If there are no further frames, the function will reset the pointer to zero and return the appropriate status code.

Before decoding the first frame, a sequence header (sequence parameter set in H.264 or sequence header in MPEG-2 and VC-1) must be present. The function skips any bitstreams before it encounters the new sequence header.

The input bitstream \textit{bs} can be of any size. If there are not enough bits to decode a frame, the function returns \textbf{MFX_ERR_MORE_DATA}, and consumes all input bits except if a partial start code or sequence header is at the end of the buffer. In this case, the function leaves the last few bytes in the bitstream buffer. If there is more incoming bitstream, the application should append the incoming bitstream to the bitstream buffer. Otherwise, the application should ignore the remaining bytes in the bitstream buffer and apply the end of stream procedure described below.

The application must set \textit{bs} to \texttt{NULL} to signal end of stream. The application may need to call this function several times to drain any internally cached frames until the function returns \textbf{MFX_ERR_MORE_DATA}.

If more than one frame is in the bitstream buffer, the function decodes until the buffer is consumed. The decoding process can be interrupted for events such as if the decoder needs additional working buffers, is readying a frame for retrieval, or encountering a new header. In these cases, the function returns appropriate status code and moves the bitstream pointer to the remaining data.

The decoder may return \textbf{MFX_ERR_NONE} without taking any data from the input bitstream buffer. If the application appends additional data to the bitstream buffer, it is possible that the bitstream buffer may contain more than 1 frame. It is recommended that the application invoke the function repeatedly until the function returns \textbf{MFX_ERR_MORE_DATA}, before appending any more data to the bitstream buffer.

This function is asynchronous.

\textbf{Return Status}
\begin{itemize}
\item \textbf{MFX_ERR_NONE} \hspace{1cm} The function completed successfully and the output surface is ready for decoding.
\item \textbf{MFX_ERR_MORE_DATA} \hspace{1cm} The function requires more bitstream at input before decoding can proceed.
\item \textbf{MFX_ERR_MORE_SURFACE} \hspace{1cm} The function requires more frame surface at output before decoding can proceed.
\item \textbf{MFX_ERR_DEVICE_LOST} \hspace{1cm} Hardware device was lost; See the \textit{Working with Microsoft* DirectX* Applications} section for further information.
\end{itemize}
MFX_WRN_DEVICE_BUSY
Hardware device is currently busy. Call this function again in a few milliseconds.

MFX_WRN_VIDEO_PARAM_CHANGED
The decoder detected a new sequence header in the bitstream. Video parameters may have changed.

MFX_ERR_INCOMPATIBLE_VIDEO_PARAM
The decoder detected incompatible video parameters in the bitstream and failed to follow them.

MFX_ERR_REALLOC_SURFACE
Bigger surface work required. May be returned only if mfxInfoMFX::EnableReallocRequest was set to ON during initialization.

Change History
This function is available since SDK API 1.0.

MFXVideoVPP
This class of functions performs video processing before encoding.

Member Functions
<table>
<thead>
<tr>
<th>MFXVideoVPP_Query</th>
<th>Queries the feature capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFXVideoVPP_QueryIOSurf</td>
<td>Queries the number of input and output surface frames required for video processing</td>
</tr>
<tr>
<td>MFXVideoVPP_Init</td>
<td>Initializes the VPP operation</td>
</tr>
<tr>
<td>MFXVideoVPP_Reset</td>
<td>Resets the current video processing operation and prepares for the next operation</td>

MFXVideoVPP_Query
Syntax
mfxStatus MFXVideoVPP_Query(mfxSession session, mfxVideoParam *in, mfxVideoParam *out);

Parameters
<table>
<thead>
<tr>
<th>parameter</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>in</td>
<td>Pointer to the mfxVideoParam structure as input</td>
</tr>
<tr>
<td>out</td>
<td>Pointer to the mfxVideoParam structure as output</td>
</tr>
</tbody>
</table>

Description
This function works in either of two modes:

If in is zero, the function returns the class configurability in the output structure. A non-zero value in a field indicates that the SDK implementation can configure it with Init.

If in is non-zero, the function checks the validity of the fields in the input structure. Then the function returns the corrected values in the output structure. If there is insufficient information to determine the validity or correction is impossible, the function zeroes the fields.

The application can call this function before or after it initializes the preprocessor.

Return Status
<table>
<thead>
<tr>
<th>status code</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_UNSUPPORTED</td>
<td>The SDK implementation does not support the specified configuration.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The underlying hardware does not fully support the specified video parameters; The video processing may be partially accelerated. Only SDK HW implementations may return this status code.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

MFXVideoVPP_QueryIOSurf
Syntax
mfxStatus MFXVideoVPP_QueryIOSurf(mfxSession session, mfxVideoParam *par, mfxFrameAllocRequest request[2]);

Parameters
**MFXVideoVPP_Init**

**Syntax**

```c
mfxStatus MFXVideoVPP_Init(mfxSession session, mfxVideoParam *par);
```

**Parameters**

- **session**: SDK session handle
- **par**: Pointer to the `mfxVideoParam` structure

**Description**

This function allocates memory and prepares tables and necessary structures for video processing. This function also does extensive validation to ensure the configuration, as specified in the input parameters, is supported.

**Return Status**

- **MFX_ERR_NONE**: The function completed successfully.
- **MFX_ERR_INVALID_VIDEO_PARAM**: The function detected invalid video parameters. These parameters may be out of the valid range, or the combination of them resulted in incompatibility. Incompatibility not resolved.
- **MFX_WRN_INCOMPATIBLE_VIDEO_PARAM**: The function detected some video parameters were incompatible with others; incompatibility resolved.
- **MFX_ERR_UNDEFINED_BEHAVIOR**: The function was called twice without a close.
- **MFX_WRN_FILTER_SKIPPED**: The VPP skipped one or more filters requested by the application.

**Change History**

This function is available since SDK API 1.0. SDK API 1.6 added new return status, **MFX_WRN_FILTER_SKIPPED**.

**MFXVideoVPP_Reset**

**Syntax**

```c
mfxStatus MFXVideoVPP_Reset(mfxSession session, mfxVideoParam *par);
```

**Parameters**

- **session**: SDK session handle
- **par**: Pointer to the `mfxVideoParam` structure

**Description**

This function is available since SDK API 1.0. SDK API 1.6 added new return status, **MFX_WRN_FILTER_SKIPPED**.
Description
This function stops the current video processing operation and restores internal structures or parameters for a new operation.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>The function detected that video parameters are wrong or they conflict with initialization parameters. Reset is impossible.</td>
</tr>
<tr>
<td>MFX_ERR_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected that provided by the application video parameters are incompatible with initialization parameters. Reset requires additional memory allocation and cannot be executed. The application should close the SDK component and then reinitialize it.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>The function detected some video parameters were incompatible with others; incompatibility resolved.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

MFXVideoVPP_Close
Syntax

```c
mfxStatus MFXVideoVPP_Close(mfxSession session);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
</tbody>
</table>

Description
This function terminates the current video processing operation and de-allocates internal tables and structures.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

MFXVideoVPP_GetVideoParam
Syntax

```c
mfxStatus MFXVideoVPP_GetVideoParam(mfxSession session, mfxVideoParam *par);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the corresponding parameter structure</td>
</tr>
</tbody>
</table>

Description
This function obtains current working parameters to the specified output structure. To return extended buffers, the application must allocate those extended buffers and attach them as part of the output structure.

Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The function completed successfully.</td>
</tr>
</tbody>
</table>

Change History
This function is available since SDK API 1.0.

MFXVideoVPP_GetVPPStat
Syntax

```c
mfxStatus MFXVideoVPP_GetVPPStat(mfxSession session, mfxVPPStat *stat);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>stat</td>
<td>Pointer to the mfxVPPStat structure</td>
</tr>
</tbody>
</table>

Description
This function obtains statistics collected during video processing.

Return Status
The function completed successfully.

**Change History**

This function is available since SDK API 1.0.

### MFXVideoVPP_RunFrameVPPAsync

#### Syntax

```c
mfxStatus MFXVideoVPP_RunFrameVPPAsync(mfxSession session, mfxFrameSurface1 *in, mfxFrameSurface1 *out, mfxExtVppAuxData *aux, mfxSyncPoint *syncp);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>SDK session handle</td>
</tr>
<tr>
<td>in</td>
<td>Pointer to the input video surface structure</td>
</tr>
<tr>
<td>out</td>
<td>Pointer to the output video surface structure</td>
</tr>
<tr>
<td>aux</td>
<td>Optional pointer to the auxiliary data structure</td>
</tr>
<tr>
<td>syncp</td>
<td>Pointer to the output sync point</td>
</tr>
</tbody>
</table>

#### Description

This function processes a single input frame to a single output frame. Retrieval of the auxiliary data is optional; the encoding process may use it.

The video processing process may not generate an instant output given an input. See section Video Processing Procedures for details on how to correctly send input and retrieve output.

At the end of the stream, call this function with the input argument `in=NULL` to retrieve any remaining frames, until the function returns **MFX_ERR_MORE_DATA**.

This function is asynchronous.

#### Return Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>The output frame is ready after synchronization.</td>
</tr>
<tr>
<td>MFX_ERR_MORE_DATA</td>
<td>Need more input frames before VPP can produce an output</td>
</tr>
<tr>
<td>MFX_ERR_MORE_SURFACE</td>
<td>The output frame is ready after synchronization. Need more surfaces at output for additional output frames available.</td>
</tr>
<tr>
<td>MFX_ERR_DEVICE_LOST</td>
<td>Hardware device was lost; See the Working with Microsoft® DirectX® Applications section for further information.</td>
</tr>
<tr>
<td>MFX_WRN_DEVICE_BUSY</td>
<td>Hardware device is currently busy. Call this function again in a few milliseconds.</td>
</tr>
</tbody>
</table>

**Change History**

This function is available since SDK API 1.0.

### Structure Reference

In the following structure references, all reserved fields must be zero.

#### mfxBitstream

**Definition**

```c
typedef struct mfxBitstream {
    union {
        struct {
            mfxEncryptedData* EncryptedData;
            mfxExtBuffer **ExtParam;
            mfxU16 NumExtParam;
        };
        mfxU32 reserved[6];
    };
    mfxI64 DecodeTimeStamp;
    mfxU64 TimeStamp;
    mfxU8* Data;
    mfxU32 DataOffset;
    mfxU32 DataLength;
    mfxU32 MaxLength;
    mfxU16 PicStruct;
    mfxU16 FrameType;
    mfxU16 DataFlag;
    mfxU16 reserved2;
} mfxBitstream;
```

**Description**

SDK Developer Reference  
API Version 1.27
The **mfxBitstream** structure defines the buffer that holds compressed video data.

### Members

<table>
<thead>

<tr>
<td>DataFlag</td>
<td>Indicates additional bitstream properties; see the <a href="#">BitstreamDataFlag enumerator</a> for details.</td>
</tr>
</tbody>
</table>

### Change History

This structure is available since SDK API 1.0.

SDK API 1.1 extended the **DataFlag** field definition.

SDK API 1.6 adds **DecodeTimeStamp** field.

SDK API 1.7 adds **ExtParam** and **NumExtParam** fields.

### **mfxBufferAllocator**

#### Definition

```c
typedef struct {
    mfxU32 reserved[4];
    mfxHDL pthis;
    mfxStatus (*Alloc)(mfxHDL pthis, mfxU32 nbytes, mfxU16 type, mfxMemId *mid);
    mfxStatus (*Lock)(mfxHDL pthis, mfxMemId mid, mfxU8 **ptr);
    mfxStatus (*Unlock)(mfxHDL pthis, mfxMemId mid);
    mfxStatus (*Free)(mfxHDL pthis, mfxMemId mid);
} mfxBufferAllocator;
```

#### Description

The **mfxBufferAllocator** structure is deprecated.

#### Members

<table>
<thead>
<tr>

</tr>
<tr>
<td>Free</td>
<td>Pointer to the function that de-allocates memory</td>
</tr>
</tbody>
</table>

#### Change History

This structure is available since SDK API 1.0.

Deprecated since API 1.17

#### Alloc

**Syntax**

```c
mfxStatus (*Alloc)(mfxHDL pthis, mfxU32 nbytes, mfxU16 type, mfxMemId *mid);
```

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pthis</td>
<td>Pointer to the allocator object</td>
</tr>
<tr>
<td>nbytes</td>
<td>Number of bytes in the linear buffer</td>
</tr>
</tbody>
</table>
Memory type; see the ExtMemBufferType enumerator for details.

mid Pointer to the allocated memory ID

**Description**

This function allocates a linear buffer and returns its block ID. The allocated memory must be 32-byte aligned.

**Return Status**

- MFX_ERR_NONE: The function successfully allocated the memory block.
- MFX_ERR_MEMORY_ALLOC: The function ran out of the specified type of memory.

**Change History**

This function is available since SDK API 1.0.

---

**Free**

**Syntax**

```c
mfxStatus (*Free)(mfxHDL pthis, mfxMemId mid);
```

**Parameters**

- **pthis**: Pointer to the allocator object.
- **mid**: Memory block ID.

**Description**

This function de-allocates memory specified by `mid`.

**Return Status**

- MFX_ERR_NONE: The function successfully de-allocated the memory block.
- MFX_ERR_INVALID_HANDLE: The memory block ID is invalid.

**Change History**

This function is available since SDK API 1.0.

---

**Lock**

**Syntax**

```c
mfxStatus (*Lock)(mfxHDL pthis, mfxMemId mid, mfxU8 **ptr);
```

**Parameters**

- **pthis**: Pointer to the allocator object.
- **mid**: Memory block ID.
- **ptr**: Pointer to the returned linear buffer pointer.

**Description**

This function locks the linear buffer and returns its pointer. The returned buffer must be 32-byte aligned.

**Return Status**

- MFX_ERR_NONE: The function successfully locked the memory block.
- MFX_ERR_INVALID_HANDLE: The memory block ID is invalid.
- MFX_ERR_LOCK_MEMORY: The function failed to lock the linear buffer.

**Change History**

This function is available since SDK API 1.0.

---

**Unlock**

**Syntax**

```c
mfxStatus (*Unlock)(mfxHDL pthis, mfxMemId mid);
```

**Parameters**

- **pthis**: Pointer to the allocator object.
- **mid**: Memory block ID.

**Description**

This function unlocks the linear buffer and invalidates its pointer.

**Return Status**

- MFX_ERR_NONE: The function unlocked the memory block.
- MFX_ERR_INVALID_HANDLE: The memory block ID is invalid.
- MFX_ERR_UNLOCK_MEMORY: The function failed to unlock the linear buffer.
The function successfully unlocked the memory block.

The memory block ID is invalid.

**Change History**

This function is available since SDK API 1.0.

### mfxDecodeStat

**Definition**

```c
typedef struct {
    mfxU32    reserved[16];
    mfxU32    NumFrame;
    mfxU32    NumSkippedFrame;
    mfxU32    NumError;
    mfxU32    NumCachedFrame;
} mfxDecodeStat;
```

**Description**

The `mfxDecodeStat` structure returns statistics collected during decoding.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumFrame</td>
<td>Number of total decoded frames</td>
</tr>
<tr>
<td>NumSkippedFrame</td>
<td>Number of skipped frames</td>
</tr>
<tr>
<td>NumError</td>
<td>Number of errors recovered</td>
</tr>
<tr>
<td>NumCachedFrame</td>
<td>Number of internally cached frames</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.0.

### mfxEncodeCtrl

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU32  reserved[4];
    mfxU16  reserved1;
    mfxU16  MfxNalUnitType;
    mfxU16  SkipFrame;
    mfxU16  QP;
    mfxU16  FrameType;
    mfxU16  NumExtParam;
    mfxU16  NumPayload;
    mfxU16  reserved2;
    mfxExtBuffer   **ExtParam;
    mfxPayload     **Payload;
} mfxEncodeCtrl;
```

**Description**

The `mfxEncodeCtrl` structure contains parameters for per-frame based encoding control.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SkipFrame</td>
<td>Indicates that current frame should be skipped or number of missed frames before the current frame. See the <code>mfxExtCodingOption2::SkipFrame</code> for details.</td>
</tr>
<tr>
<td>QP</td>
<td>If nonzero, this value overwrites the global QP value for the current frame in the constant QP mode.</td>
</tr>
<tr>
<td>FrameType</td>
<td>Encoding frame type; see the <code>FrameType</code> enumerator for details. If the encoder works in the encoded order, the application must specify the frame type. If the encoder works in the display order, only key frames are enforceable.</td>
</tr>
<tr>
<td>MfxNalUnitType</td>
<td>Type of NAL unit that contains encoding frame. All supported values are defined by <code>MfxNalUnitType</code> enumerator. Other values defined in ITU-T H.265 specification are not supported. The SDK encoder uses this field only if application sets <code>mfxExtCodingOption3::EnableNalUnitType</code> option to <strong>ON</strong> during encoder initialization.</td>
</tr>
<tr>
<td>NumExtParam</td>
<td>Number of extra control buffers.</td>
</tr>
</tbody>
</table>

### SDK Developer Reference

**API Version 1.27**
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumPayload</td>
<td>Number of payload records to insert into the bitstream.</td>
</tr>
<tr>
<td>ExtParam</td>
<td>Pointer to an array of pointers to external buffers that provide additional information or control to the encoder for this frame or field pair; a typical usage is to pass the VPP auxiliary data generated by the video processing pipeline to the encoder. See the ExtendedBufferID for the list of extended buffers.</td>
</tr>
<tr>
<td>Payload</td>
<td>Pointer to an array of pointers to user data (MPEG-2) or SEI messages (H.264) for insertion into the bitstream; for field pictures, odd payloads are associated with the first field and even payloads are associated with the second field. See the mfxPayload structure for payload definitions.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.0. SDK API 1.1 extended the QP field. Since SDK API 1.3 specification of QP in display order mode is allowed. SDK API 1.25 adds MfxNalUnitType field.

**mfxEncodeStat**

**Definition**

```c
typedef struct {
    mfxU32    reserved[16];
    mfxU32    NumFrame;
    mfxU64    NumBit;
    mfxU32    NumCachedFrame;
} mfxEncodeStat;
```

**Description**

The `mfxEncodeStat` structure returns statistics collected during encoding.

**Members**

- **NumFrame** Number of encoded frames
- **NumCachedFrame** Number of internally cached frames
- **NumBit** Number of bits for all encoded frames

**Change History**

This structure is available since SDK API 1.0.

**mfxExtBuffer**

**Definition**

```c
typedef struct {
    mfxU32    BufferId;
    mfxU32    BufferSz;
} mfxExtBuffer;
```

**Description**

The `mfxExtBuffer` structure is the common header definition for external buffers and video processing hints.

**Members**

- **BufferId** Identifier of the buffer content. See the `ExtendedBufferID` enumerator for a complete list of extended buffers.
- **BufferSz** Size of the buffer

**Change History**

This structure is available since SDK API 1.0.

**mfxExtAVCRefListCtrl**

**Definition**

```c
```
typedef struct {
    mfxExtBuffer    Header;
    mfxU16          NumRefIdxL0Active;
    mfxU16          NumRefIdxL1Active;
} mfxExtAVCRefListCtrl;

Description
The `mfxExtAVCRefListCtrl` structure configures reference frame options for the H.264 encoder. See Reference List Selection and Long-term Reference frame chapters for more details.

Not all implementations of the SDK encoder support `LongTermIdx` and `ApplyLongTermIdx` fields in this structure. The application has to use query mode 1 to determine if such functionality is supported. To do so, the application has to attach this extended buffer to `mfxVideoParam` structure and call `MFXVideoENCODE_Query` function. If function returns `MFX_ERR_NONE` and these fields were set to one, then such functionality is supported. If function fails or sets fields to zero then this functionality is not supported.

Members

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be <code>MFX_EXTBUFF_AVC_REFLIST_CTRL</code></td>
</tr>
<tr>
<td>NumRefIdxL0Active</td>
<td>Specify the number of reference frames in the active reference list L0. This number should be less or equal to the <code>NumRefFrame</code> parameter from encoding initialization.</td>
</tr>
<tr>
<td>NumRefIdxL1Active</td>
<td>Specify the number of reference frames in the active reference list L1. This number should be less or equal to the <code>NumRefFrame</code> parameter from encoding initialization.</td>
</tr>
<tr>
<td>PreferredRefList</td>
<td>Specify list of frames that should be used to predict the current frame.</td>
</tr>
<tr>
<td>RejectedRefList</td>
<td>Specify list of frames that should not be used for prediction.</td>
</tr>
<tr>
<td>LongTermRefList</td>
<td>Specify list of frames that should be marked as long-term reference frame.</td>
</tr>
<tr>
<td>FrameOrder, PicStruct</td>
<td>Together these fields are used to identify reference picture. Use <code>FrameOrder = MFX_FRAMEORDER_UNKNOWN</code> to mark unused entry.</td>
</tr>
<tr>
<td>ViewID</td>
<td>Reserved and must be zero.</td>
</tr>
<tr>
<td>LongTermIdx</td>
<td>Index that should be used by the SDK encoder to mark long-term reference frame.</td>
</tr>
<tr>
<td>ApplyLongTermIdx</td>
<td>If it is equal to zero, the SDK encoder assigns long-term index according to internal algorithm. If it is equal to one, the SDK encoder uses <code>LongTermIdx</code> value as long-term index.</td>
</tr>
</tbody>
</table>

Change History
This structure is available since SDK API 1.3.
The SDK API 1.7 adds `LongTermIdx` and `ApplyLongTermIdx` fields.

mfxExtAVCRefLists
Definition
typedef struct {
    mfxExtBuffer    Header;
    mfxU16          NumRefIdxL0Active;
    mfxU16          NumRefIdxL1Active;
    mfxU16          reserved[2];
} mfxExtAVCRefLists;

Description
The `mfxExtAVCRefLists` structure specifies reference lists for the SDK encoder. It may be used together with the `mfxExtAVCRefListCtrl` structure to create customized reference lists. If both structures are used together, then the SDK encoder takes reference lists from `mfxExtAVCRefLists` structure and modifies them according to the `mfxExtAVCRefListCtrl` instructions. In case of interlaced coding, the first `mfxExtAVCRefLists` structure affects TOP field and the second – BOTTOM field.
Not all implementations of the SDK encoder support this structure. The application has to use query function to determine if it is supported.

**Members**

<table>
<thead>
<tr>
<th>Field</th>

<td>Together these fields are used to identify reference picture. Use FrameOrder = MFX_FRAMEORDER_UNKNOWN to mark unused entry. Use PicStruct = MFX_PICSTRUCT_FIELD_TFF for TOP field, PicStruct = MFX_PICSTRUCT_FIELD_BFF for BOTTOM field.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.9.

### mfxExtCodingOption

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU16        reserved1;
    mfxU16        RateDistortionOpt;
    mfxU16        MECostType;
    mfxU16        MESearchType;
    mfxI16Pair    MVSearchWindow;
    mfxU16        EndOfSequence;
    mfxU16        FramePicture;

    union {
        struct {
            /* AVC */
            mfxU16    CAVLC;
            mfxU16    reserved2[2];
            mfxU16    RecoveryPointSEI;
            mfxU16    ViewOutput;
            mfxU16    NalHrdConformance;
            mfxU16    SingleSelNalUnit;
            mfxU16    VuiVclHrdParameters;
            mfxU16    RefPicListReordering;
            mfxU16    ResetRefList;
            mfxU16    RefPicMarkRep;
            mfxU16    FieldOutput;
            mfxU16    IntraPredBlockSize;
            mfxU16    InterPredBlockSize;
            mfxU16    MVPrecision;
            mfxU16    MaxDecFrameBuffering;
            mfxU16    AUDelimiter;
            mfxU16    EndOfStream;
            mfxU16    PicTimingSEI;
            mfxU16    VuiNalHrdParameters;
        };
    };
} mfxExtCodingOption;
```

**Description**

The `mfxExtCodingOption` structure specifies additional options for encoding.

The application can attach this extended buffer to the `mfxVideoParam` structure to configure initialization.

**Members**

<table>

<tr>
<td>NalHrdConformance</td>
<td>If this option is turned ON, then AVC encoder produces HRD conformant bitstream. If it is turned OFF, then AVC encoder may, but not necessary does, violate HRD conformance. I.e. this option can force encoder to produce HRD conformant stream, but cannot force it to produce unconformant stream. See the CodingOptionValue enumerator for values of this option.                                                                loor compensators, see the CodingOptionValue enumerator for values of this option. See the CodingOptionValue</td>
</tr>
</tbody>
</table>
| SingleSeiNalUnit      | If set, encoder puts all SEI messages in the singe NAL unit. It includes both kinds of messages, provided by application and created by encoder. It is three states option, see CodingOptionValue enumerator for values of this option:  
  **UNKNOWN**  - put each SEI in its own NAL unit,  
  **ON**  - put all SEI messages in the same NAL unit,  
  **OFF**  - the same as unknown |
| VuiVclHrdParameters   | If set and VBR rate control method is used then VCL HRD parameters are written in bitstream with identical to NAL HRD parameters content. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                         |
| RefPicListReordering  | Set this flag to activate reference picture list reordering; this value is reserved and must be zero.                                                                                                                                                                                                                                                                                                                                     |
| ResetRefList          | Set this flag to reset the reference list to non-IDR I-frames of a GOP sequence. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                                                                   |
| RefPicMarkRep         | Set this flag to write the reference picture marking repetition SEI message into the output bitstream. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                         |
| FieldOutput           | Set this flag to instruct the AVC encoder to output bitstreams immediately after the encoder encodes a field, in the field-encoding mode. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                         |
| ViewOutput            | Set this flag to instruct the MVC encoder to output each view in separate bitstream buffer. See the CodingOptionValue enumerator for values of this option and SDK Reference Manual for Multi-View Video Coding for more details about usage of this flag.                                                                                                                                                                                                                                         |
| IntraPredBlockSize    | Minimum block size of intra-prediction; This value is reserved and must be zero.                                                                                                                                                                                                                                                                                                                                                       |
| InterPredBlockSize    | Minimum block size of inter-prediction; This value is reserved and must be zero.                                                                                                                                                                                                                                                                                                                                                         |
| MVPrecision           | Specify the motion estimation precision; this parameter is reserved and must be zero.                                                                                                                                                                                                                                                                                                                                                   |
| MaxDecFrameBuffering  | Specifies the maximum number of frames buffered in a DBP. A value of zero means “unspecified.”                                                                                                                                                                                                                                                                                                                                       |
| AUDelimiter           | Set this flag to insert the Access Unit Delimiter NAL. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                                                                                                    |
| EndOfStream           | Deprecated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PicTimingSEI          | Set this flag to insert the picture timing SEI with pic_struct syntax element. See sub-clauses D.1.2 and D.2.2 of the ISO/IEC 14496-10 specification for the definition of this syntax element. See the CodingOptionValue enumerator for values of this option. The default value is ON.                                                                 |
| VuiNalHrdParameters   | Set this flag to insert NAL HRD parameters in the VUI header. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                                                                                  |
| FramePicture          | Set this flag to encode interlaced fields as interlaced frames; this flag does not affect progressive input frames. See the CodingOptionValue enumerator for values of this option.                                                                                                                                                                                                                                              |
| RecoveryPointSEI      | Set this flag to insert the recovery point SEI message at the beginning of every intra refresh cycle. See the description of IntRefType in mfxExtCodingOption2 structure for details on how to enable and configure intra refresh. If intra refresh is not enabled then this flag is ignored.  
  See the CodingOptionValue enumerator for values of this option.                                                                 |

**Change History**

This structure is available since SDK API 1.0.

SDK API 1.3 adds RefPicMarkRep, FieldOutput, NalHrdConformance, SingleSeiNalUnit and VuiVclHrdParameters fields.

SDK API 1.4 adds ViewOutput field.

SDK API 1.6 adds RecoveryPointSEI field.

SDK API 1.17 deprecates EndOfSequence and EndOfStream fields.

**mfxExtCodingOption2**

**Definition**
typedef struct {

    mfxU16     EnableMAD;      /* tri-state option */
    mfxU16     UseRawRef;      /* tri-state option */
} mfxExtCodingOption2;

Description
The **mfxExtCodingOption2** structure together with **mfxExtCodingOption** structure specifies additional options for encoding.

The application can attach this extended buffer to the **mfxVideoParam** structure to configure initialization and to the **mfxEncodeCtrl** during runtime.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Header.BufferId</strong></td>
<td>Must be <strong>MFX_EXTBUFF_CODING_OPTION2</strong>.</td>
</tr>
<tr>
<td><strong>IntRefType</strong></td>
<td>Specifies intra refresh type. See the <strong>IntraRefreshTypes</strong>. The major goal of intra refresh is improvement of error resilience without significant impact on encoded bitstream size caused by I frames. The SDK encoder achieves this by encoding part of each frame in refresh cycle using intra MBs. <strong>MFX_REFRESH_NO</strong> means no refresh. <strong>MFX_REFRESH_VERTICAL</strong> means vertical refresh, by column of MBs. <strong>MFX_REFRESH_HORIZONTAL</strong> means horizontal refresh, by rows of MBs. <strong>MFX_REFRESH_SLICE</strong> means horizontal refresh by slices without overlapping. In case of <strong>MFX_REFRESH_SLICE</strong> SDK ignores IntRefCycleSize (size of refresh cycle equals number slices). This parameter is valid during initialization and initialization. When used with <strong>temporal scalability</strong>, intra refresh applied only to base layer.</td>
</tr>
<tr>
<td><strong>IntRefCycleSize</strong></td>
<td>Specifies number of pictures within refresh cycle starting from 2. 0 and 1 are invalid values. This parameter is valid only during initialization.</td>
</tr>
<tr>
<td><strong>IntRefQPDelta</strong></td>
<td>Specifies QP difference for inserted intra MBs. This is signed value in [-51, 51] range. This parameter is valid during initialization and runtime.</td>
</tr>
<tr>
<td><strong>MaxFrameSize</strong></td>
<td>Specify maximum encoded frame size in byte. This parameter is used in AVBR and VBR bitrate control modes and ignored in others. The SDK encoder tries to keep frame size below specified limit but minor overshoots are possible to preserve visual quality. This parameter is valid during initialization and runtime.</td>
</tr>
<tr>
<td><strong>MaxSliceSize</strong></td>
<td>Specify maximum slice size in bytes. If this parameter is specified other controls over number of slices are ignored. Not all codecs and SDK implementations support this value. Use <strong>Query</strong> function to check if this feature is supported.</td>
</tr>
<tr>
<td><strong>BitrateLimit</strong></td>
<td>Turn off this flag to remove bitrate limitations imposed by the SDK encoder. This flag is intended for special usage models and usually the application should not set it. Setting this flag may lead to violation of HRD conformance and severe visual artifacts. See the <strong>CodingOptionValue</strong> enumerator for values of this option. The default value is ON, i.e. bitrate is limited. This parameter is valid only during initialization.</td>
</tr>
</tbody>
</table>
MBBRC  Setting this flag enables macroblock level bitrate control that generally improves subjective visual quality. Enabling this flag may have negative impact on performance and objective visual quality metric. See the CodingOptionValue enumerator for values of this option. The default value depends on target usage settings.

ExtBRC  Turn ON this option to enable external BRC. See the CodingOptionValue enumerator for values of this option. Use Query function to check if this feature is supported.

LookAheadDepth  Specifies the depth of look ahead rate control algorithm. It is the number of frames that SDK encoder analyzes before encoding. Valid value range is from 10 to 100 inclusive. To instruct the SDK encoder to use the default value the application should zero this field.

Trellis  This option is used to control trellis quantization in AVC encoder. See TrellisControl enumerator for possible values of this option. This parameter is valid only during initialization.

RepeatPPS  This flag controls picture parameter set repetition in AVC encoder. Turn ON this flag to repeat PPS with each frame. See the CodingOptionValue enumerator for values of this option. The default value is ON. This parameter is valid only during initialization.

BRefType  This option controls usage of B frames as reference. See BRefControl enumerator for possible values of this option. This parameter is valid only during initialization.

AdaptiveI  This flag controls insertion of I frames by the SDK encoder. Turn ON this flag to allow changing of frame type from P and B to I. This option is ignored if GopOptFlag in mfxInfoMFX structure is equal to MFX_GOP_STRICT. See the CodingOptionValue enumerator for values of this option. This parameter is valid only during initialization.

AdaptiveB  This flag controls changing of frame type from B to P. Turn ON this flag to allow such changing. This option is ignored if GopOptFlag in mfxInfoMFX structure is equal to MFX_GOP_STRICT. See the CodingOptionValue enumerator for values of this option. This parameter is valid only during initialization.

LookAheadDS  This option controls downsampling in look ahead bitrate control mode. See LookAheadDownSampling enumerator for possible values of this option. This parameter is valid only during initialization.

NumMbPerSlice  This option specifies suggested slice size in number of macroblocks. The SDK can adjust this number based on platform capability. If this option is specified, i.e. if it is not equal to zero, the SDK ignores mfxInfoMFX::NumSlice parameter.

SkipFrame  This option enables usage of mfxEncodeCtrl::SkipFrame parameter. See the SkipFrame enumerator for values of this option.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

MinQPI, MaxQPI, MinQPP, MaxQPP, MinQPB, MinQPB  Minimum and maximum allowed QP values for different frame types. Valid range is 1..51 inclusive. Zero means default value, i.e.no limitations on QP.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

FixedFrameRate  This option sets fixed_frame_rate_flag in VUI.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

DisableDeblockingIdc  This option disable deblocking.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

DisableVUI  This option completely disables VUI in output bitstream.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

BufferingPeriodSEI  This option controls insertion of buffering period SEI in the encoded bitstream. It should be one of the following values: MFX_BPSEI_DEFAULT – encoder decides when to insert BP SEI, MFX_BPSEI_IFRAME – BP SEI should be inserted with every I frame.

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

EnableMAD  Turn ON this flag to enable per-frame reporting of Mean Absolute Difference. This parameter is valid only during initialization.

UseRawRef  Turn ON this flag to use raw frames for reference instead of reconstructed frames. This parameter is valid during initialization and runtime (only if was turned ON during initialization).

Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.

Change History
This structure is available since SDK API 1.6.
The SDK API 1.7 added LookAheadDepth and Trellis fields.
The SDK API 1.8 adds RepeatPPS, BRefType, AdaptiveI, AdaptiveB, LookAheadDS and NumMbPerSlice fields.

The SDK API 1.9 adds MaxSliceSize, SkipFrame, MinQPI, MaxQPI, MinQPP, MaxQPP, MinQPBC, MinQPBC, FixedFrameRate and DisableDeblockingIdc fields.

The SDK API 1.10 adds DisableVUIfields and BufferingPeriodSEI fields.

The SDK API 1.11 adds EnableMAD field.

The SDK API 1.13 adds UseRawRef field.

The SDK API 1.17 deprecates ExtBRC field.

The SDK API 1.24 returns ExtBRC field.

<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be <code>MFX_EXTBUFF_CODING_OPTION3</code>.</td>
</tr>
<tr>
<td>NumSliceI, NumSliceP, NumSliceB</td>
<td>The number of slices for I, P and B frames separately. Not all codecs and SDK implementations support these values. Use <code>Query</code> function to check if this feature is supported.</td>
</tr>
<tr>
<td>WinBRCMaxAvgKbps</td>
<td>When rate control method is <code>MFX_RATECONTROL_VBR</code>, <code>MFX_RATECONTROL_LA</code>, <code>MFX_RATECONTROL_LA_HRD</code> or <code>MFX_RATECONTROL_QVBR</code> this parameter specifies the maximum bitrate averaged over a sliding window specified by <code>WinBRCSize</code>. For <code>MFX_RATECONTROL_CBR</code> this parameter is ignored and equals <code>TargetKbps</code>.</td>
</tr>
<tr>
<td>WinBRCSize</td>
<td>When rate control method is <code>MFX_RATECONTROL_CBR</code>, <code>MFX_RATECONTROL_VBR</code>, <code>MFX_RATECONTROL_LA</code>, <code>MFX_RATECONTROL_LA_HRD</code> or <code>MFX_RATECONTROL_QVBR</code> this parameter specifies sliding window size in frames. Set this parameter to zero to disable sliding window.</td>
</tr>
<tr>
<td>QVBRQuality</td>
<td>When rate control method is <code>MFX_RATECONTROL_QVBR</code> this parameter specifies quality factor. It is a value in the 1...51 range, where 1 corresponds to the best quality.</td>
</tr>
<tr>
<td>EnableMBQP</td>
<td>Turn ON this option to enable per-macroblock QP control, rate control method must be <code>MFX_RATECONTROL_CQP</code>. See the <code>CodingOptionValue</code> enumerator for values of this option. This parameter is valid only during initialization.</td>
</tr>
<tr>
<td>IntRefCycleDist</td>
<td>Distance between the beginnings of the intra-refresh cycles in frames. Zero means no distance between cycles.</td>
</tr>
<tr>
<td>DirectBiasAdjustment</td>
<td>Turn ON this option to enable the ENC mode decision algorithm to bias to fewer B Direct/Skip types. Applies only to B frames, all other frames will ignore this setting. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>GlobalMotionBiasAdjustment</td>
<td>Enables global motion bias. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>MVCostScalingFactor</td>
<td>MV cost scaling ratio. It is used when <code>GlobalMotionBiasAdjustment</code> is ON. Values are: 0: set MV cost to be 0, 1: scale MV cost to be 1/2 of the default value, 2: scale MV cost to be 1/4 of the default value, 3: scale MV cost to be 1/8 of the default value.</td>
</tr>
<tr>
<td>MBDisableSkipMap</td>
<td>Turn ON this option to enable usage of <code>mfxExtMBDisableSkipMap</code>. See the <code>CodingOptionValue</code> enumerator for values of this option. This parameter is valid only during initialization.</td>
</tr>
<tr>
<td>WeightedPred, WeightedBiPred</td>
<td>Weighted prediction mode. See the <code>WeightedPred</code> enumerator for values of these options.</td>
</tr>
<tr>
<td>AspectRatioInfoPresent</td>
<td>Instructs encoder whether aspect ratio info should present in VUI parameters. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>OverscanInfoPresent</td>
<td>Instructs encoder whether overscan info should present in VUI parameters. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>OverscanAppropriate</td>
<td>ON indicates that the cropped decoded pictures output are suitable for display using overscan. OFF indicates that the cropped decoded pictures output contain visually important information in the entire region out to the edges of the cropping rectangle of the picture. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>TimingInfoPresent</td>
<td>Instructs encoder whether frame rate info should present in VUI parameters. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>BitstreamRestriction</td>
<td>Instructs encoder whether bitstream restriction info should present in VUI parameters. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>ScenarioInfo</td>
<td>Provides a hint to encoder about the scenario for the encoding session. See the <code>ScenarioInfo</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>ContentInfo</td>
<td>Provides a hint to encoder about the content for the encoding session. See the <code>ContentInfo</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>PRefType</td>
<td>When GopRefDist = 1, specifies the model of reference list construction and DPB management. See the <code>PRefType</code> enumerator for values of this option.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>FadeDetection</strong></td>
<td>Instructs encoder whether internal fade detection algorithm should be used for calculation of weigh/offset values for pred_weight_table unless application provided mfxExtPredWeightTable for this frame. See the CodingOptionValue enumerator for values of this option.</td>
</tr>
<tr>
<td><strong>GPB</strong></td>
<td>Turn this option OFF to make HEVC encoder use regular P-frames instead of GPB.</td>
</tr>
<tr>
<td><strong>LowDelayHrd</strong></td>
<td>Corresponds to AVC syntax element low_delay_hrd_flag (VUI). See the CodingOptionValue enumerator for values of this option.</td>
</tr>
<tr>
<td><strong>MotionVectorsOverPicBoundaries</strong></td>
<td>When set to OFF, no sample outside the picture boundaries and no sample at a fractional sample position for which the sample value is derived using one or more samples outside the picture boundaries is used for inter prediction of any sample. When set to ON, one or more samples outside picture boundaries may be used in inter prediction.</td>
</tr>
<tr>
<td><strong>MaxFrameSizeI</strong></td>
<td>Same as mfxExtCodingOption2::MaxFrameSize but affects only I-frames.</td>
</tr>
<tr>
<td><strong>MaxFrameSizeP</strong></td>
<td>Same as mfxExtCodingOption2::MaxFrameSize but affects only P-frames.</td>
</tr>
<tr>
<td><strong>EnableQPOffset</strong></td>
<td>Enables QPOffset control.</td>
</tr>
<tr>
<td><strong>QPOffset</strong></td>
<td>When EnableQPOffset set to ON and RateControlMethod is CQP specifies QP offset per pyramid layer. For B-pyramid, B-frame QP = QPB + QPOffset[layer]. For P-pyramid, P-frame QP = QPP + QPOffset[layer].</td>
</tr>
<tr>
<td><strong>NumRefActiveP, NumRefActiveBL0, NumRefActiveBL1</strong></td>
<td>Max number of active references for P and B frames in reference picture lists 0 and 1 correspondingly. Array index is pyramid layer.</td>
</tr>
<tr>
<td><strong>TransformSkip</strong></td>
<td>For HEVC if this option turned ON, transform_skip_enabled_flag will be set to 1 in PPS, OFF specifies that transform_skip_enabled_flag will be set to 0.</td>
</tr>
<tr>
<td><strong>BRCPanicMode</strong></td>
<td>Controls panic mode in AVC and MPEG2 encoders.</td>
</tr>
<tr>
<td><strong>LowDelayBRC</strong></td>
<td>When rate control method is MFX_RATECONTROL_VBR, MFX_RATECONTROL_QVBR or MFX_RATECONTROL_VCM this parameter specifies frame size tolerance. Set this parameter to MFX_CODINGOPTION_ON to allow strictly obey average frame size set by MaxKbps, e.g. cases when MaxFrameSize == (MaxKbps<em>1000)/(8</em>FrameRateExtN/FrameRateExtD). Also MaxFrameSizeI and MaxFrameSizeP can be set separately.</td>
</tr>
<tr>
<td><strong>EnableMBForceIntra</strong></td>
<td>Turn ON this option to enable usage of mfxExtMBForceIntra for AVC encoder. See the CodingOptionValue enumerator for values of this option. This parameter is valid only during initialization.</td>
</tr>
<tr>
<td><strong>AdaptiveMaxFrameSize</strong></td>
<td>If this option is ON, BRC may decide a larger P or B frame size than what MaxFrameSizeP dictates when the scene change is detected. It may benefit the video quality.</td>
</tr>
<tr>
<td><strong>RepartitionCheckEnable</strong></td>
<td>Controls AVC encoder attempts to predict from small partitions. Default value allows encoder to choose preferred mode, MFX_CODINGOPTION_ON forces encoder to favor quality, MFX_CODINGOPTION_OFF forces encoder to favor performance.</td>
</tr>
<tr>
<td><strong>QuantScaleType</strong></td>
<td>For MPEG2 specifies mapping between quantizer_scale_code and quantiser_scale (see QuantScaleType enum).</td>
</tr>
<tr>
<td><strong>IntraVLCFormat</strong></td>
<td>For MPEG2 specifies which table shall be used for coding of DCT coefficients of intra macroblocks (see IntraVLCFormat enum).</td>
</tr>
<tr>
<td><strong>ScanType</strong></td>
<td>For MPEG2 specifies transform coefficients scan pattern (see ScanType enum).</td>
</tr>
<tr>
<td><strong>EncodedUnitsInfo</strong></td>
<td>Turn this option ON to make encoded units info available in mfxExtEncodedUnitsInfo.</td>
</tr>
<tr>
<td><strong>EnableNalUnitType</strong></td>
<td>If this option is turned ON, then HEVC encoder uses NAL unit type provided by application in mfxEncodeCtrl::MfxNalUnitType field. This parameter is valid only during initialization. Not all codecs and SDK implementations support this value. Use Query function to check if this feature is supported.</td>
</tr>
<tr>
<td><strong>ExtBrcAdaptiveLTR</strong></td>
<td>Turn OFF to prevent Adaptive marking of Long Term Reference Frames when using ExtBRC. When ON and using ExtBRC, encoders will mark, modify, or remove LTR frames based on encoding parameters and content properties. The application must set each input frame's mfxFrameData::FrameOrder for correct operation of LTR.</td>
</tr>
</tbody>
</table>
TargetChromaFormatPlus1  Minus 1 specifies target encoding chroma format (see ChromaFormatIdc enumerator). May differ from source one. TargetChromaFormatPlus1 = 0 mean default target chroma format which is equal to source (mfxVideoParam::mfx::FrameInfo::ChromaFormat + 1), except RGBA source format. In case of RGBA source format default target chroma format is 4:2:0 (instead of 4:4:4) for the purpose of backward compatibility.

TargetBitDepthLuma  Target encoding bit-depth for luma samples. May differ from source one. 0 mean default target bit-depth which is equal to source (mfxVideoParam::mfx::FrameInfo::BitDepthLuma).

TargetBitDepthChroma  Target encoding bit-depth for chroma samples. May differ from source one. 0 mean default target bit-depth which is equal to source (mfxVideoParam::mfx::FrameInfo::BitDepthChroma).

Change History

This structure is available since SDK API 1.11.

The SDK API 1.13 adds EnableMBQP, MBDisableSkipMap, DirectBiasAdjustment, GlobalMotionBiasAdjustment and MVCostScalingFactor fields.

The SDK API 1.16 adds IntRefCycleDist, WeightedPred, WeightedBiPred, AspectRatioInfoPresent, OverscanInfoPresent, OverscanAppropriate, TimingInfoPresent, BitstreamRestriction, ScenarioInfo, ContentInfo, PRefType fields.

The SDK API 1.17 adds FadeDetection field.

The SDK API 1.18 adds GPB field.

The SDK API 1.19 adds LowDelayHrd, MotionVectorsOverPicBoundaries, MaxFrameSizeI, MaxFrameSizeP, EnableQPOffset, QPOffset, NumRefActiveP, NumRefActiveBL0, NumRefActiveBL1 fields.

The SDK API 1.21 adds BRCPanicMode field.

The SDK API 1.23 adds LowDelayBRC, EnableMBForceIntra, AdaptiveMaxFrameSize, RepartitionCheckEnable fields.

The SDK API 1.25 adds EncodedUnitsInfo field.

The SDK API 1.25 adds EnableNalUnitType field.

The SDK API 1.26 adds TransformSkip, ExtBrcAdaptiveLTR fields.

The SDK API 1.27 adds TargetChromaFormatPlus1, TargetBitDepthLuma and TargetBitDepthChroma fields.

**mfxExtCodingOptionSPSPPS**

**Definition**

```c
struct {
    mfxExtBuffer    Header;
    mfxU8        *SPSBuffer;
    mfxU8        *PPSBuffer;
    mfxU16        SPSBufSize;
    mfxU16        PPSBufSize;
    mfxU16        SPSId;
    mfxU16        PPSId;
} mfxExtCodingOptionSPSPPS;
```

**Description**

Attach this structure as part of the extended buffers to configure the SDK encoder during MFXVideoENCODE_Init. The sequence or picture parameters specified by this structure overwrite any such parameters specified by the structure or any other extended buffers attached therein.

For H.264, SPSBuffer and PPSBuffer must point to valid bitstreams that contain the sequence parameter set and picture parameter set, respectively. For MPEG-2, SPSBuffer must point to valid bitstreams that contain the sequence header followed by any sequence header extension. The PPSBuffer pointer is ignored. The SDK encoder imports parameters from these buffers. If the encoder does not support the specified parameters, the encoder does not initialize and returns the status code MFX_ERR_INCOMPATIBLE_VIDEO_PARAM.

Check with the MFXVideoENCODE_Query function for the support of this multiple segment encoding feature. If this feature is not supported, the query returns MFX_ERR_UNSUPPORTED.

**Members**

- **Header.BufferId** Must be MFX_EXTBUFF_CODING_OPTION_SPSPPS.
| **SPSBuffer** | Pointer to a valid bitstream that contains the SPS (sequence parameter set for H.264 or sequence header followed by any sequence header extension for MPEG-2) buffer; can be NULL to skip specifying the SPS. |
| **PPSBuffer** | Pointer to a valid bitstream that contains the PPS (picture parameter set for H.264 or picture header followed by any picture header extension for MPEG-2) buffer; can be NULL to skip specifying the PPS. |
| **SPSBufSize** | Size of the SPS in bytes |
| **PPSBufSize** | Size of the PPS in bytes |
| **SPSId** | SPS identifier; the value is reserved and must be zero. |
| **PPSId** | PPS identifier; the value is reserved and must be zero. |

**Change History**

This structure is available since SDK API 1.0.

### mfxExtOpaqueSurfaceAlloc

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU32        reserved1[2];
    struct {
        mfxFrameSurface1 **Surfaces;
        mfxU32    reserved2[4];
        mfxU16    Type;
        mfxU16    NumSurface;
    } In, Out;
} mfxExtOpaqueSurfaceAlloc;
```

**Description**

The `mfxExtOpaqueSurfaceAlloc` structure defines the opaque surface allocation information.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_OPAQUE_SURFACE_ALLOCATION`
- **Type** Surface type chosen by the application. Any valid combination of flags may be used, for example: `MFX_MEMTYPE_SYSTEM_MEMORY | MFX_MEMTYPE_FROM_DECODE | MFX_MEMTYPE_EXTERNAL_FRAME`. The SDK ignores any irrelevant flags. See the `ExtMemFrameType` enumerator for details.
- **NumSurface** The number of allocated frame surfaces.
- **Surfaces** The array pointers of allocated frame surfaces.
- **In, Out** The `In` refers to surface allocation for input and `out` refers to surface allocation for output. For decoding, `In` is ignored. For encoding, `Out` is ignored.

**Change History**

This structure is available since SDK API 1.3.

### mfxExtVideoSignalInfo

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU16        VideoFormat;
    mfxU16        VideoFullRange;
    mfxU16        ColourDescriptionPresent;
    mfxU16        ColourPrimaries;
    mfxU16        TransferCharacteristics;
    mfxU16        MatrixCoefficients;
} mfxExtVideoSignalInfo;
```

**Description**

The `mfxExtVideoSignalInfo` structure defines the video signal information.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VIDEO_SIGNAL_INFO`
VideoFormat, VideoFullRange, ColourPrimaries, TransferCharacteristics, MatrixCoefficients, ColourDescriptionPresent

These parameters define the video signal information.

For H.264, see Annex E of the ISO/IEC 14496-10 specification for the definition of these parameters.

For MPEG-2, see section 6.3.6 of the ITU* H.262 specification. The field VideoFullRange is ignored.

For VC-1, see section 6.1.14.5 of the SMPTE* 421M specification. The fields VideoFormat and VideoFullRange are ignored.

If ColourDescriptionPresent is zero, the color description information (including ColourPrimaries, TransferCharacteristics, and MatrixCoefficients) will does not present in the bitstream.

Change History

This structure is available since SDK API 1.3.

mfxExtPictureTimingSEI

Definition

typedef struct {
    mfxExtBuffer    Header;
    mfxU32          reserved[14];
    struct {
        mfxU16    ClockTimestampFlag;
        mfxU16    CtType;
        mfxU16    NuitFieldBasedFlag;
        mfxU16    CountingType;
        mfxU16    FullTimestampFlag;
        mfxU16    DiscontinuityFlag;
        mfxU16    CntDroppedFlag;
        mfxU16    NFrames;
        mfxU16    SecondsFlag;
        mfxU16    MinutesFlag;
        mfxU16    HoursFlag;
        mfxU16    SecondsValue;
        mfxU16    MinutesValue;
        mfxU16    HoursValue;
        mfxU32    TimeOffset;
    } TimeStamp[3];
} mfxExtPictureTimingSEI;

Description

The mfxExtPictureTimingSEI structure configures the H.264 picture timing SEI message. The encoder ignores it if HRD information in stream is absent and PicTimingSEI option in mfxExtCodingOption structure is turned off. See mfxExtCodingOption for details.

If the application attaches this structure to the mfxVideoParam structure during initialization, the encoder inserts the picture timing SEI message based on provided template in every access unit of coded bitstream.

If application attaches this structure to the mfxEncodeCtrl structure at runtime, the encoder inserts the picture timing SEI message based on provided template in access unit that represents current frame.

Members

Header.BufferId Must be MFX_EXTBUFF_PICTURE_TIMING_SEI
These parameters define the picture timing information. An invalid value of 0xFFFF indicates that application does not set the value and encoder must calculate it.

See Annex D of the ISO/IEC 14496-10 specification for the definition of these parameters.

Change History
This structure is available since SDK API 1.3.

**mfxExtAvcTemporalLayers**

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU32          reserved1[4];
    mfxU16          reserved2;
    mfxU16          BaseLayerPID;

    struct {  
        mfxU16 Scale;
        mfxU16 reserved[3];
    } Layer[8];
} mfxExtAvcTemporalLayers;
```

**Description**

The `mfxExtAvcTemporalLayers` structure configures the H.264 temporal layers hierarchy. If application attaches it to the `mfxVideoParam` structure during initialization, the SDK encoder generates the temporal layers and inserts the prefix NAL unit before each slice to indicate the temporal and priority IDs of the layer.

This structure can be used with the display-order encoding mode only.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_AVC_TEMPORAL_LAYERS`
- **BaseLayerPID** The priority ID of the base layer; the SDK encoder increases the ID for each temporal layer and writes to the prefix NAL unit.
- **Scale** The ratio between the frame rates of the current temporal layer and the base layer.
- **Layer** The array of temporal layers; Use `Scale=0` to specify absent layers.

Change History
This structure is available since SDK API 1.3.

**mfxExtVppAuxData**

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    union{
        struct {  
            mfxU32  SpatialComplexity;
            mfxU32  TemporalComplexity;
        };
        struct {  
            mfxU16  PicStruct;
            mfxU16  reserved[3];
        };
    };
    mfxU16          SceneChangeRate;
    mfxU16          RepeatedFrame;
} mfxExtVppAuxData;
```

**Description**

These parameters define the picture timing information. An invalid value of 0xFFFF indicates that application does not set the value and encoder must calculate it.

See Annex D of the ISO/IEC 14496-10 specification for the definition of these parameters.

Change History
This structure is available since SDK API 1.3.
The `mfxExtVppAuxData` structure returns auxiliary data generated by the video processing pipeline. The encoding process may use the auxiliary data by attaching this structure to the `mfxEncodeCtrl` structure.

### Members

<table>

<td></td>
</tr>
</tbody>
</table>

### Change History

This structure is available since SDK API 1.0. SDK API 1.6 adds `PicStruct` field and deprecates `SpatialComplexity`, `TemporalComplexity`, `SceneChangeRate` and `RepeatedFrame` fields.

### `mfxExtVPPDenoise`

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU16        DenoiseFactor;
} mfxExtVppDenoise;
```

**Description**

The `mfxExtVPPDenoise` structure is a hint structure that configures the VPP denoise filter algorithm.

**Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be</td>
<td><code>MFX_EXTBUFF_VPP_DENOISE</code></td>
</tr>
<tr>
<td>DenoiseFactor</td>
<td></td>
<td>Value of 0-100 (inclusive) indicates the level of noise to remove.</td>
</tr>
</tbody>
</table>

### Change History

This structure is available since SDK API 1.1.

### `mfxExtVppMctf`

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU16       FilterStrength;
    mfxU16       reserved[21];
} mfxExtVppMctf;
```

**Description**

The `mfxExtVppMctf` structure allows to setup Motion-Compensated Temporal Filter (MCTF) during the VPP initialization and to control parameters at runtime. By default, MCTF is off; an application may enable it by adding `MFX_EXTBUFF_VPP_MCTF` to `mfxExtVPPDoUse` buffer or by attaching `mfxExtVppMctf` to `mfxVideoParam` during initialization or reset.

**Members**

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be</td>
<td><code>MFX_EXTBUFF_VPP_MCTF</code></td>
</tr>
<tr>
<td>FilterStrength</td>
<td></td>
<td>0..20 value (inclusive) to indicate the filter-strength of MCTF. A strength of MCTF process controls degree of possible changes of pixel values eligible for MCTF; the bigger the strength the larger the change is; it is a dimensionless quantity, values 1..20 inclusively imply strength; value 0 stands for AUTO mode and is valid during initialization or reset only; if invalid value is given, it is fixed to default value which is 0. If this field is 1..20 inclusive, MCTF operates in fixed-strength mode with the given strength of MCTF process. At runtime, value 0 and values greater than 20 are ignored.</td>
</tr>
</tbody>
</table>

### Change History

This structure is available since SDK API 1.26.

### `mfxExtVPPDetail`
### Definition

**typedef struct {**
  mfxExtBuffer Header;
  mfxU16 DetailFactor;
} mfxExtVppDetail;**

### Description

The **mfxExtVppDetail** structure is a hint structure that configures the VPP detail/edge enhancement filter algorithm.

### Members

- **Header.BufferId** Must be **MFX_EXTBUFF_VPP_DETAIL**
- **DetailFactor** 0-100 value (inclusive) to indicate the level of details to be enhanced.

### Change History

This structure is available since SDK API 1.1.

---

### Definition

**typedef struct {**
  mfxExtBuffer Header;
  mfxU32 NumAlg;
  mfxU32 *AlgList;
} mfxExtVppDoNotUse;**

### Description

The **mfxExtVppDoNotUse** structure tells the VPP not to use certain filters in pipeline. See “Table 4 Configurable VPP filters” for complete list of configurable filters.

The user can attach this structure to the **mfxVideoParam** structure when initializing video processing.

### Members

- **Header.BufferId** Must be **MFX_EXTBUFF_VPP_DONOTUSE**
- **NumAlg** Number of filters (algorithms) not to use
- **AlgList** Pointer to a list of filters (algorithms) not to use

### Change History

This structure is available since SDK API 1.0.

---

### Definition

**typedef struct {**
  mfxExtBuffer Header;
  mfxU32 NumAlg;
  mfxU32 *AlgList;
} mfxExtVppDoUse;**

### Description

The **mfxExtVppDoUse** structure tells the VPP to include certain filters in pipeline.

Each filter may be included in pipeline by two different ways. First one, by adding filter ID to this structure. In this case, default filter parameters are used. Second one, by attaching filter configuration structure directly to the *mfxVideoParam* structure. In this case, adding filter ID to *mfxExtVppDoUse* structure is optional. See “Table 4 Configurable VPP filters” for complete list of configurable filters, their IDs and configuration structures.

The user can attach this structure to the **mfxVideoParam** structure when initializing video processing.

**NOTE:** **MFX_EXTBUFF_VPP_COMPOSITE** cannot be enabled using **mfxExtVppDoUse** because default parameters are undefined for this filter. Application must attach appropriate filter configuration structure directly to the **mfxVideoParam** structure to enable it.

### Members

- **Header.BufferId** Must be **MFX_EXTBUFF_VPP_DOUSE**
- **NumAlg** Number of filters (algorithms) to use
- **AlgList** Pointer to a list of filters (algorithms) to use

### Change History

This structure is available since SDK API 1.3.
**mfxExtVPPFrameRateConversion**

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU16        Algorithm;
    mfxU16        reserved;
    mfxU32        reserved2[15];
} mfxExtVPPFrameRateConversion;
```

**Description**

The `mfxExtVPPFrameRateConversion` structure configures the VPP frame rate conversion filter. The user can attach this structure to the `mfxVideoParam` structure when initializing video processing, resetting it or query its capability.

On some platforms advanced frame rate conversion algorithm, algorithm based on frame interpolation, is not supported. To query its support the application should add `MFX_FRCALGM_FRAME_INTERPOLATION` flag to `Algorithm` value in `mfxExtVPPFrameRateConversion` structure, attach it to structure and call `MFXVideoVPP_Query` function. If filter is supported the function returns `MFX_ERR_NONE` status and copies content of input structure to output one. If advanced filter is not supported then simple filter will be used and function returns `MFX_WRN_INCOMPATIBLE_VIDEO_PARAM`, copies content of input structure to output one and corrects `Algorithm` value.

If advanced FRC algorithm is not supported both `MFXVideoVPP_Init` and `MFXVideoVPP_Reset` functions returns `MFX_WRN_INCOMPATIBLE_VIDEO_PARAM` status.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VPP_FRAME_RATE_CONVERSION`.
- **Algorithm** See the `FrcAlgm` enumerator for a list of frame rate conversion algorithms.

**Change History**

This structure is available since SDK API 1.3.

**mfxExtVPPProcAmp**

**Definition**

```c
typedef struct {
    mfxExtBuffer    Header;
    mfxF64    Brightness;
    mfxF64    Contrast;
    mfxF64    Hue;
    mfxF64    Saturation;
} mfxExtVPPProcAmp;
```

**Description**

The `mfxExtVPPProcAmp` structure is a hint structure that configures the VPP ProcAmp filter algorithm. The structure parameters will be clipped to their corresponding range and rounded by their corresponding increment.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VPP_PROCAMP`
- **Brightness** The brightness parameter is in the range of -100.0F to 100.0F, in increments of 0.1F. Setting this field to 0.0F will disable brightness adjustment.
- **Contrast** The contrast parameter in the range of 0.0F to 10.0F, in increments of 0.01F, is used for manual contrast adjustment. Setting this field to 1.0F will disable contrast adjustment. If the parameter is negative, contrast will be adjusted automatically.
- **Hue** The hue parameter is in the range of -180F to 180F, in increments of 0.1F. Setting this field to 0.0F will disable hue adjustment.
- **Saturation** The saturation parameter is in the range of 0.0F to 10.0F, in increments of 0.01F. Setting this field to 1.0F will disable saturation adjustment.

**Note:** There are no default values for fields in this structure, all settings must be explicitly specified every time this buffer is submitted for processing.

**Change History**

This structure is available since SDK API 1.1.

**mfxExtVPPImageStab**

**Definition**

typedef struct {
    mfxExtBuffer    Header;
    mfxU16  Mode;
    mfxU16  reserved[11];
} mfxExtVPPImageStab;

Description

The `mfxExtVPPImageStab` structure is a hint structure that configures the VPP image stabilization filter.

On some platforms this filter is not supported. To query its support, the application should use the same approach that it uses to configure VPP filters - by adding filter ID to `mfxExtVPPDoUse` structure or by attaching `mfxExtVPPImageStab` structure directly to the `mfxVideoParam` structure and calling `MFXVideoVPP_Query` function. If this filter is supported function returns `MFX_ERR_NONE` status and copies content of input structure to output one. If filter is not supported function returns `MFX_WRN_FILTER_SKIPPED`, removes filter from `mfxExtVPPDoUse` structure and zeroes `mfxExtVPPImageStab` structure.

If image stabilization filter is not supported, both `MFXVideoVPP_Init` and `MFXVideoVPP_Reset` functions returns `MFX_WRN_FILTER_SKIPPED` status.

The application can retrieve list of active filters by attaching `mfxExtVPPDoUse` structure to `mfxVideoParam` structure and calling `MFXVideoVPP_GetVideoParam` function. The application must allocate enough memory for filter list.

Change History

This structure is available since SDK API 1.6.

`mfxExtVPPComposite`

Definition
The `mfxExtVPPComposite` structure is used to control composition of several input surfaces in the one output. In this mode, the VPP skips any other filters. The VPP returns error if any mandatory filter is specified and filter skipped warning for optional filter. The only supported filters are deinterlacing and interlaced scaling. The only supported combinations of input and output color formats are:
- RGB to RGB,
- NV12 to NV12,
- RGB and NV12 to NV12, for per pixel alpha blending use case.

The VPP returns `MFX_ERR_MORE_DATA` for additional input until an output is ready. When the output is ready, VPP returns `MFX_ERR_NONE`. The application must process the output frame after synchronization.

Composition process is controlled by:
- `mfxFrameInfo::CropXYWH` in input surface - defines location of picture in the input frame,
- `InputStream[i].DstXYWH` defines location of the cropped input picture in the output frame,
- `mfxFrameInfo::CropXYWH` in output surface - defines actual part of output frame. All pixels in output frame outside this region will be filled by specified color.

If the application uses composition process on video streams with different frame sizes, the application should provide maximum frame size in `mfxVideoParam` during initialization, reset or query operations.

If the application uses composition process, `MFXVideoVPP_QueryIOSurf` function returns cumulative number of input surfaces, i.e. number required to process all input video streams. The function sets frame size in the `mfxFrameAllocRequest` equal to the size provided by application in the `mfxVideoParam`.

Composition process supports all types of surfaces, but opaque type has next limitations:
- all input surfaces should have the same size,
- all input surfaces should have the same color format,
- all input surfaces should be described in one `mfxExtOpaqueSurfaceAlloc` structure.

All input surfaces should have the same type and color format, except per pixel alpha blending case, where it is
allowed to mix NV12 and RGB surfaces.

There are three different blending use cases:

- **Luma keying.** In this case, all input surfaces should have NV12 color format specified during VPP initialization. Part of each surface, including first one, may be rendered transparent by using `LumaKeyEnable`, `LumaKeyMin` and `LumaKeyMax` values.

- **Global alpha blending.** In this case, all input surfaces should have the same color format specified during VPP initialization. It should be either NV12 or RGB. Each input surface, including first one, can be blended with underlying surfaces by using `GlobalAlphaEnable` and `GlobalAlpha` values.

- **Per pixel alpha blending.** In this case, it is allowed to mix NV12 and RGB input surfaces. Each RGB input surface, including first one, can be blended with underlying surfaces by using `PixelAlphaEnable` value.

It is not allowed to mix different blending use cases in the same function call.

In special case where destination region of the output surface defined by output crops is fully covered with destination sub-regions of the surfaces, the fast compositing mode can be enabled. The main use case for this mode is a video-wall scenario with fixed destination surface partition into sub-regions of potentially different size.

In order to trigger this mode, application must cluster input surfaces into tiles, defining at least one tile by setting the `NumTiles` field to be greater than 0 and assigning surfaces to the corresponding tiles setting `TileId` field to the value within `[0..NumTiles)` range per input surface. Tiles should also satisfy following additional constraints:

- each tile should not have more than 8 surfaces assigned to it;
- tile bounding boxes, as defined by the enclosing rectangles of a union of a surfaces assigned to this tile, should not intersect;

### Change History

This structure is available since SDK API 1.8.

The SDK API 1.9 adds `LumaKeyEnable`, `LumaKeyMin`, `LumaKeyMax`, `GlobalAlphaEnable`, `GlobalAlpha` and `PixelAlphaEnable` fields.

The SDK API 1.24 adds 'TileId' and 'NumTiles' fields.

**mfxExtVPPVideoSignalInfo**

**Definition**
/* TransferMatrix */
enum {
    MFX_TRANSFERMATRIX_UNKNOWN = 0,
    MFX_TRANSFERMATRIX_BT709   = 1,
    MFX_TRANSFERMATRIX_BT601   = 2
};

/* NominalRange */
enum {
    MFX_NOMINALRANGE_UNKNOWN   = 0,
    MFX_NOMINALRANGE_0_255     = 1,
    MFX_NOMINALRANGE_16_235    = 2
};
typedef struct {
    mfxExtBuffer    Header;
    mfxU16          reserved1[4];

    union {
        struct { // Init
            struct { // In, Out
                mfxU16  TransferMatrix;
                mfxU16  NominalRange;
                mfxU16  reserved2[6];
            } In, Out;
        };

        struct { // Runtime
            mfxU16  TransferMatrix;
            mfxU16  NominalRange;
            mfxU16  reserved3[14];
        };
    };
} mfxExtVPPVideoSignalInfo;

Description
The mfxExtVPPVideoSignalInfo structure is used to control transfer matrix and nominal range of YUV frames. The application should provide it during initialization. It is supported for all kinds of conversion YUV->YUV, YUV->RGB, RGB->YUV.

This structure is used by VPP only and is not compatible with mfxExtVideoSignalInfo.

mfxExtEncoderCapability

Definition
typedef struct {
    mfxExtBuffer Header;
    mfxU32      MBPerSec;
    mfxU16      reserved[58];
} mfxExtEncoderCapability;

Description
The mfxExtEncoderCapability structure is used to retrive SDK encoder capability. See description of mode 4 of the MFXVideoENCODE_Query function for details how to use this structure.

Not all implementations of the SDK encoder support this extended buffer. The application has to use query mode 1 to determine if such functionality is supported. To do so, the application has to attach this extended buffer to mfxVideoParam structure and call MFXVideoENCODE_Query function. If function returns MFX_ERR_NONE then such functionality is supported.

</tr>
</tbody>
</table>

Change History
This structure is available since SDK API 1.7.

### mfxExtEncoderResetOption

#### Definition

definition
typedef struct {
    mfxExtBuffer Header;
    mfxU16 StartNewSequence;
    mfxU16 reserved[11];
} mfxExtEncoderResetOption;

#### Description

The `mfxExtEncoderResetOption` structure is used to control the SDK encoder behavior during reset. By using this structure, the application instructs the SDK encoder to start new coded sequence after reset or continue encoding of current sequence.

This structure is also used in mode 3 of `MFXVideoENCODE_Query` function to check for reset outcome before actual reset. The application should set `StartNewSequence` to required behavior and call query function. If query fails, see status codes below, then such reset is not possible in current encoder state. If the application sets `StartNewSequence` to `MFX_CODINGOPTION_UNKNOWN` then query function replaces it by actual reset type: `MFX_CODINGOPTION_ON` if the SDK encoder will begin new sequence after reset or `MFX_CODINGOPTION_OFF` if the SDK encoder will continue current sequence.

Using this structure may cause next status codes from `MFXVideoENCODE_Reset` and `MFXVideoENCODE_Query` functions:

- `MFX_ERR_INVALID_VIDEO_PARAM` - if such reset is not possible. For example, the application sets `StartNewSequence` to off and requests resolution change.
- `MFX_ERR_INCOMPATIBLE_VIDEO_PARAM` - if the application requests change that leads to memory allocation. For example, the application sets `StartNewSequence` to on and requests resolution change to bigger than initialization value.
- `MFX_ERR_NONE` - if such reset is possible.

There is limited list of parameters that can be changed without starting a new coded sequence:

- bitrate parameters, `TargetKbps` and `MaxKbps` in the `mfxInfoMFX` structure.
- number of slices, `NumSlice` in the `mfxInfoMFX` structure. Number of slices should be equal or less than number of slices during initialization.
- number of temporal layers in `mfxExtAVCTemporalLayers` structure. Reset should be called immediately before encoding of frame from base layer and number of reference frames should be big enough for new temporal layers structure.
- Quantization parameters, `QPI`, `QPP` and `QPB` in the `mfxInfoMFX` structure.

As it is described in Configuration Change chapter, the application should retrieve all cached frames before calling reset. When query function checks for reset outcome, it expects that this requirement be satisfied. If it is not true and there are some cached frames inside the SDK encoder, then query result may differ from reset one, because the SDK encoder may insert IDR frame to produce valid coded sequence.

Not all implementations of the SDK encoder support this extended buffer. The application has to use query mode 1 to determine if such functionality is supported. To do so, the application has to attach this extended buffer to `mfxVideoParam` structure and call `MFXVideoENCODE_Query` function. If function returns `MFX_ERR_NONE` then such functionality is supported.

See also Appendix C: Streaming and Video Conferencing Features.

#### Members

- **Header.BufferId**
  Must be `MFX_EXTBUFF_ENCODER_RESET_OPTION`

- **StartNewSequence**
  Instructs encoder to start new sequence after reset. It is one of the `CodingOptionValue` options:
  - `MFX_CODINGOPTION_ON` – the SDK encoder completely reset internal state and begins new coded sequence after reset, including insertion of IDR frame, sequence and picture headers.
  - `MFX_CODINGOPTION_OFF` – the SDK encoder continues encoding of current coded sequence after reset, without insertion of IDR frame.
  - `MFX_CODINGOPTION_UNKNOWN` – depending on the current encoder state and changes in configuration parameters the SDK encoder may or may not start new coded sequence. This value is also used to query reset outcome.

### Change History

This structure is available since SDK API 1.7.

### mfxExtAVCEncodedFrameInfo

#### Definition
typedef struct {
    mfxExtBuffer Header;
    mfxU32 FrameOrder;
    mfxU16 PicStruct;
    mfxU16 LongTermIdx;
    mfxU32 MAD;
    mfxU16 BRCPanicMode;
    mfxU16 QP;
    mfxU32 SecondFieldOffset;
    mfxU16 reserved[2];
} UsedRefListL0[32], UsedRefListL1[32];
} mfxExtAVCEncodedFrameInfo;

Description

The `mfxExtAVCEncodedFrameInfo` is used by the SDK encoder to report additional information about encoded picture. The application can attach this buffer to the `mfxBitstream` structure before calling `MFXVideoENCODE_EncodeFrameAsync` function. For interlaced content the SDK encoder requires two such structures. They correspond to fields in encoded order.

Not all implementations of the SDK encoder support this extended buffer. The application has to use query mode 1 to determine if such functionality is supported. To do so, the application has to attach this extended buffer to `mfxVideoParam` structure and call `MFXVideoENCODE_Query` function. If function returns `MFX_ERR_NONE` then such functionality is supported.

</tbody>
</table>

Change History

This structure is available since SDK API 1.7.

The SDK API 1.8 adds `MAD` and `BRCPanicMode` fields.

The SDK API 1.9 adds `SecondFieldOffset` fields.

mfxExtEncoderROI

Definition
/* ROI QP adjustment mode */
enum {
    MFX_ROI_MODE_PRIORITY = 0,
    MFX_ROI_MODE_QP_DELTA = 1
};

typedef struct {
    mfxExtBuffer Header;
    mfxU16 NumROI;
    mfxU16 ROIMode;
    mfxU16 reserved1[1011];
    struct {
        mfxU32 Left;
        mfxU32 Top;
        mfxU32 Right;
        mfxU32 Bottom;
        union {
            mfxI16 Priority;
            mfxI16 DeltaQP;
        };
        mfxU16 reserved2[?];
    } ROI[256];
} mfxExtEncoderROI;

Description
The mfxExtEncoderROI structure is used by the application to specify different Region Of Interests during encoding. It may be used at initialization or at runtime.

Members

<table>

</tr>
<tr>
<td>ROIMode</td>
<td>QP adjustment mode for ROIs. Defines if Priority or DeltaQP is used during encoding in BRC mode (only CBR and VBR are affected). For CQP rate control mode DeltaQP is always used for ROI encoding.</td>
</tr>
<tr>
<td>ROI</td>
<td>Array of ROIs. Different ROI may overlap each other. If macroblock belongs to several ROI, Priority or Delta QP from ROI with lowest index is used.</td>
</tr>
<tr>
<td>Left, Top, Right, Bottom</td>
<td>ROI location rectangle. ROI rectangle definition is using end-point exclusive notation. In other words, the pixel with (Right, Bottom) coordinates lies immediately outside of the ROI. Left, Top, Right, Bottom should be aligned by codec-specific block boundaries (should be dividable by 16 for AVC, or by 32 for HEVC). Every ROI with unaligned coordinates will be expanded by SDK to minimal-area block-aligned ROI, enclosing the original one. For example (5, 5, 15, 31) ROI will be expanded to (0, 0, 16, 32) for AVC encoder, or to (0, 0, 32, 32) for HEVC.</td>
</tr>
<tr>
<td>DeltaQP</td>
<td>Delta QP of ROI. Used if ROIMode = MFX_ROI_MODE_QP_DELTA. This is absolute value in the -51...51 range, which will be added to the MB QP. Lesser value produces better quality.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of ROI. For VBR, CBR and AVBR modes, this is relative priority of the region in the -3...3 range. Bigger value produces better quality. For CQP mode, this is absolute value in the -51...51 range, that will be added to the MB QP. Lesser value produces better quality.</td>
</tr>
</tbody>
</table>

Change History
This structure is available since SDK API 1.8.
The SDK API 1.22 adds ROIMode and DeltaQP fields.
The SDK API 1.25 adds clarification that ROI rectangle Right, Bottom are considered exclusive and alignment rules changed.

mfxExtMasteringDisplayColourVolume

Definition
typedef struct {
    mfxExtBuffer Header;
    mfxU16 reserved[13];
    mfxU16 InsertPayloadToggle;
    mfxU16 DisplayPrimariesX[3];
    mfxU16 DisplayPrimariesY[3];
    mfxU16 WhitePointX;
    mfxU16 WhitePointY;
    mfxU32 MaxDisplayMasteringLuminance;
    mfxU32 MinDisplayMasteringLuminance;
} mfxExtMasteringDisplayColourVolume;

**Description**

The `mfxExtMasteringDisplayColourVolume` configures the HDR SEI message. If application attaches this structure to the `mfxEncodeCtrl` at runtime, the encoder inserts the HDR SEI message for current frame and ignores `InsertPayloadToggle`. If application attaches this structure to the `mfxVideoParam` during initialization or reset, the encoder inserts HDR SEI message based on `InsertPayloadToggle`. Fields semantic defined in ITU-T* H.265 Annex D.

</tr>
</tbody>
</table>

Change History
This structure is available since SDK API 1.8.
The SDK API 1.13 adds `TelecinePattern` and `TelecineLocation` fields.

`mfxFrameAllocator`
Definition
typedef struct {
    mfxU32    reserved[4];
    mfxHDL    pthis;
    mfxStatus (*Alloc) (mfxHDL pthis, mfxFrameAllocRequest *request, mfxFrameAllocResponse *response);
    mfxStatus (*Lock)   (mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr);
    mfxStatus (*Unlock) (mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr);
    mfxStatus (*GetHDL) (mfxHDL pthis, mfxMemId mid, mfxHDL *handle);
    mfxStatus (*Free)   (mfxHDL pthis, mfxFrameAllocResponse *response);
} mfxFrameAllocator;

Description
The `mfxFrameAllocator` structure describes the callback functions `Alloc`, `Lock`, `Unlock`, `GetHDL` and `Free` that the SDK implementation might use for allocating internal frames. Applications that operate on OS-specific video surfaces must implement these callback functions.

Using the default allocator implies that frame data passes in or out of SDK functions through pointers, as opposed to using memory IDs.

The SDK behavior is undefined when using an incompletely defined external allocator. See the section Memory Allocation and External Allocators for additional information.

Members

Alloc Syntax

```
mfxStatus (*Alloc)(mfxHDL pthis, mfxFrameAllocRequest *request, mfxFrameAllocResponse *response);
```

Parameters
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pthis</td>
<td>Pointer to the allocator object</td>
</tr>
<tr>
<td>request</td>
<td>Pointer to the <code>mfxFrameAllocRequest</code> structure that specifies the type and number of required frames</td>
</tr>
</tbody>
</table>
Description
This function allocates surface frames. For decoders, MFXVideoDECODE_Init calls Alloc only once. That call includes all frame allocation requests. For encoders, MFXVideoENCODER_Init calls Alloc twice: once for the input surfaces and again for the internal reconstructed surfaces.

If two SDK components must share DirectX* surfaces, this function should pass the pre-allocated surface chain to SDK instead of allocating new DirectX surfaces. See the Surface Pool Allocation section for additional information.

Return Status
- MFX_ERR_NONE: The function successfully allocated the memory block.
- MFX_ERR_MEMORY_ALLOC: The function failed to allocate the video frames.
- MFX_ERR_UNSUPPORTED: The function does not support allocating the specified type of memory.

Change History
This function is available since SDK API 1.0.

Free
Syntax
mfxStatus (*Free)(mfxHDL pthis, mfxFrameAllocResponse *response);

Parameters
- pthis: Pointer to the allocator object
- response: Pointer to the mfxFrameAllocResponse structure returned by the Alloc function

Description
This function de-allocates all allocated frames.

Return Status
- MFX_ERR_NONE: The function successfully de-allocated the memory block.

Change History
This function is available since SDK API 1.0.

Lock
Syntax
mfxStatus (*Lock)(mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr);

Parameters
- pthis: Pointer to the allocator object
- mid: Memory block ID
- ptr: Pointer to the returned frame structure

Description
This function locks a frame and returns its pointer.

Return Status
- MFX_ERR_NONE: The function successfully locked the memory block.
- MFX_ERR_LOCK_MEMORY: This function failed to lock the frame.

Change History
This function is available since SDK API 1.0.

Unlock
Syntax
mfxStatus (*Unlock)(mfxHDL pthis, mfxMemId mid, mfxFrameData *ptr);

Parameters
- pthis: Pointer to the allocator object
- mid: Memory block ID
- ptr: Pointer to the frame structure; This pointer can be NULL.
Description
This function unlocks a frame and invalidates the specified frame structure.

Return Status
MFX_ERR_NONE The function successfully unlocked the frame.

Change History
This function is available since SDK API 1.0.

GetHDL
Syntax

mfxStatus (*GetHDL)(mfxHDL pthis, mfxMemId mid, mfxHDL *hdl);

Parameters

pthis Pointer to the allocator object
mid Memory block ID
hdl Pointer to the returned OS-specific handle

Description
This function returns the OS-specific handle associated with a video frame. If the handle is a COM interface, the reference counter must increase. The SDK will release the interface afterward.

Return Status
MFX_ERR_NONE The function successfully returned the OS-specific handle.
MFX_ERR_UNSUPPORTED The function does not support obtaining OS-specific handle.

Change History
This function is available since SDK API 1.0.

mfxFrameAllocRequest
Definition

typedef struct {
    union {
        mfxU32  AllocId;
        mfxU32  reserved[1];
    };
    mfxU32    reserved3[3];
    mfxFrameInfo    Info;
    mfxU16    Type; /* decoder or processor render targets */
    mfxU16    NumFrameMin;
    mfxU16    NumFrameSuggested;
    mfxU16    reserved2;
} mfxFrameAllocRequest;

Description
The mfxFrameAllocRequest structure describes multiple frame allocations when initializing encoders, decoders and video preprocessors. A range specifies the number of video frames. Applications are free to allocate additional frames. In any case, the minimum number of frames must be at least NumFrameMin or the called function will return an error.

Members

AllocId Unique (within the session) ID of component requested the allocation.
Info Describes the properties of allocated frames
Type Allocated memory type; see the ExtMemFrameType enumerator for details.
NumFrameMin Minimum number of allocated frames
NumFrameSuggested Suggested number of allocated frames

Change History
This structure is available since SDK API 1.0.
The SDK API 1.16 adds AllocId field.

mfxFrameAllocResponse
Definition
typedef struct {
    mfxU32      AllocId;
    mfxU32      reserved[3];
    mfxMemId    *mids;  /* the array allocated by application */
    mfxU16      NumFrameActual;
    mfxU16      reserved2;
} mfxFrameAllocResponse;

Description
The mfxFrameAllocResponse structure describes the response to multiple frame allocations. The calling function returns the number of video frames actually allocated and pointers to their memory IDs.

Members

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllocId</td>
<td>Unique (within the session) ID of component requested the allocation.</td>

<tr>
<td>ExtParam</td>
<td>Points to an array of pointers to the extra configuration structures; see the ExtendedBufferID enumerator for a list of extended configurations.</td>
</tr>
<tr>
<td>MemType</td>
<td>Allocated memory type; see the ExtMemFrameType enumerator for details. Used for better integration of 3rd party plugins into SDK pipeline.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.0.

SDK API 1.3 extended the Corrupted and DataFlag fields.

SDK 1.8 replaced Pitch by PitchHigh and PitchLow fields.

SDK API 1.11 added NumExtParam and ExtParam fields.

SDK API 1.19 added MemType field.

SDK API 1.25 added A2RGB10 field.

SDK API 1.27 added Y410 field.

**mfxFrameInfo**

**Definition**
typedef struct {
    mfxU32 reserved[4];
    mfxU16 reserved4;
    mfxU16 BitDepthLuma;
    mfxU16 BitDepthChroma;
    mfxU16 Shift;
    mfxFrameId FrameId;
    mfxU32 FourCC;
    union {
        struct { /* Frame parameters */
            mfxU16 Width;
            mfxU16 Height;
            mfxU16 CropX;
            mfxU16 CropY;
            mfxU16 CropW;
            mfxU16 CropH;
        };
        struct { /* Buffer parameters (for plain formats like P8) */
            mfxU64 BufferSize;
            mfxU32 reserved5;
        };
    };
    mfxU32 FrameRateExtN;
    mfxU32 FrameRateExtD;
    mfxU16 reserved3;
    mfxU16 AspectRatioW;
    mfxU16 AspectRatioH;
    mfxU16 PicStruct;
    mfxU16 ChromaFormat;
    mfxU16 reserved2;
} mfxFrameInfo;

Description

The `mfxFrameInfo` structure specifies properties of video frames. See also Appendix A: Configuration Parameter Constraints.

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

Not all codecs and SDK implementations support this value. Use `Query` function to check if this feature is supported.
FourCC | FourCC code of the color format; see the ColorFourCC enumerator for details.
---|---
Width, Height | Width and height of the video frame in pixels; Width must be a multiple of 16. Height must be a multiple of 16 for progressive frame sequence and a multiple of 32 otherwise.
CropX, CropY, CropW, CropH | Display the region of interest of the frame; specify the display width and height in mfxVideoParam.
BufferSize | Size of frame buffer in bytes. Valid only for plain formats (when FourCC is P8); Width, Height and crops in this case are invalid.
AspectRatioW, AspectRatioH | These parameters specify the sample aspect ratio. If sample aspect ratio is explicitly defined by the standards (see Table 6-3 in the MPEG-2 specification or Table E-1 in the H.264 specification), AspectRatioW and AspectRatioH should be the defined values. Otherwise, the sample aspect ratio can be derived as follows:
AspectRatioW = display_aspect_ratio_width * display_height;
AspectRatioH = display_aspect_ratio_height * display_width;

For MPEG-2, the above display aspect ratio must be one of the defined values in Table 6-3. For H.264, there is no restriction on display aspect ratio values.

If both parameters are zero, the encoder uses default value of sample aspect ratio.
FrameRateExtN, FrameRateExtD | Specify the frame rate by the formula: \( \frac{\text{FrameRateExtN}}{\text{FrameRateExtD}} \).

For encoding, frame rate must be specified. For decoding, frame rate may be unspecified (FrameRateExtN and FrameRateExtD are all zeros.) In this case, the frame rate is default to 30 frames per second.
PicStruct | Picture type as specified in the PicStruct enumerator
ChromaFormat | Color sampling method; the value of ChromaFormat is the same as that of ChromaFormatIdc. ChromaFormat is not defined if FourCC is zero.

**Change History**

This structure is available since SDK API 1.0.

SDK API 1.9 added BitDepthLuma, BitDepthChroma and Shift fields.

SDK API 1.15 adds BufferSize field.

**Remarks**

See Appendix A for constraints of specifying certain parameters during SDK class initialization and operation.

**mfxFrameSurface1**

**Definition**

```c
typedef struct {
    mfxU32 reserved[4];
    mfxFrameInfo Info;
    mfxFrameData Data;
} mfxFrameSurface1;
```

**Description**

The mfxFrameSurface1 structure defines the uncompressed frames surface information and data buffers. The frame surface is in the frame or complementary field pairs of pixels up to four color-channels, in two parts: mfxFrameInfo and mfxFrameData.

**Members**

- **Info** mfxFrameInfo structure specifies surface properties
- **Data** mfxFrameData structure describes the actual frame buffer.

**Change History**

This structure is available since SDK API 1.0.

**mfxInfoMFX**

**Definition**
typedef struct {

        };
        struct { /* JPEG Encoding Options */
            mfxU16 Interleaved;
            mfxU16 Quality;
            mfxU16 RestartInterval;
            mfxU16 reserved5[10];
        };
    }
} mfxInfoMFX;

Description
This structure specifies configurations for decoding, encoding and transcoding processes. A zero value in any of these fields indicates that the field is not explicitly specified.

Members
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LowPower</strong></td>
<td>For encoders set this flag to ON to reduce power consumption and GPU usage. Use the <code>CodingOptionValue</code> enumerator for values of this option. Use <code>Query</code> function to check if this feature is supported.</td>
</tr>
<tr>
<td><strong>BRCParamMultiplier</strong></td>
<td>Specifies a multiplier for bitrate control parameters. Affects next four variables. Use the <code>Query</code> function to check if this feature is supported. <strong>InitialDelayInKB, BufferSizeInKB, TargetKbps, MaxKbps.</strong> If this value is not equal to zero encoder calculates BRC parameters as value * BRCParamMultiplier.</td>
</tr>
<tr>
<td><strong>FrameInfo</strong></td>
<td><code>mfxFrameInfo</code> structure that specifies frame parameters</td>
</tr>
<tr>
<td><strong>CodecId</strong></td>
<td>Specifies the codec format identifier in the FOURCC code; see the <code>CodecFormatFourCC</code> enumerator for details. This is a mandated input parameter for <code>QueryIOSurf</code> and <code>Init</code> functions.</td>
</tr>
<tr>
<td><strong>CodecProfile</strong></td>
<td>Specifies the codec profile; see the <code>CodecProfile</code> enumerator for details. Specify the codec profile explicitly or the SDK functions will determine the correct profile from other sources, such as resolution and bitrate.</td>
</tr>
<tr>
<td><strong>CodecLevel</strong></td>
<td>Codec level; see the <code>CodecLevel</code> enumerator for details. Specify the codec level explicitly or the SDK functions will determine the correct level from other sources, such as resolution and bitrate.</td>
</tr>
<tr>
<td><strong>GopPicSize</strong></td>
<td>Number of pictures within the current GOP (Group of Pictures); if <code>GopPicSize = 0</code>, then the GOP size is unspecified. If <code>GopPicSize = 1</code>, only I-frames are used. See Example 15 for pseudo-code that demonstrates how SDK uses this parameter.</td>
</tr>
<tr>
<td><strong>GopRefDist</strong></td>
<td>Distance between I- or P (or GPB) - key frames; if it is zero, the GOP structure is unspecified. Note: If <code>GopRefDist = 1</code>, there are no regular B-frames used (only P or GPB); if <code>mfxExtCodingOption3::GPB</code> is ON, GPB frames (B without backward references) are used instead of P. See Example 15 for pseudo-code that demonstrates how SDK uses this parameter.</td>
</tr>
<tr>
<td><strong>GopOptFlag</strong></td>
<td>ORs of the <code>GopOptFlag</code> enumerator indicate the additional flags for the GOP specification; see Example 15 for an example of pseudo-code that demonstrates how to use this parameter.</td>
</tr>
<tr>
<td><strong>IdrInterval</strong></td>
<td>For H.264, <code>IdrInterval</code> specifies IDR-frame interval in terms of I-frames; if <code>IdrInterval = 0</code>, then every I-frame is an IDR-frame. If <code>IdrInterval = 1</code>, then every other I-frame is an IDR-frame, etc.</td>
</tr>
<tr>
<td></td>
<td>For HEVC, if <code>IdrInterval = 0</code>, then only first I-frame is an IDR-frame. If <code>IdrInterval = 1</code>, then every I-frame is an IDR-frame. If <code>IdrInterval = 2</code>, then every other I-frame is an IDR-frame, etc.</td>
</tr>
<tr>
<td></td>
<td>For MPEG2, <code>IdrInterval</code> defines sequence header interval in terms of I-frames. If <code>IdrInterval = N</code>, SDK inserts the sequence header before every <code>Nth</code> I-frame. If <code>IdrInterval = 0</code> (default), SDK inserts the sequence header once at the beginning of the stream.</td>
</tr>
<tr>
<td></td>
<td>If <code>GopPicSize</code> or <code>GopRefDist</code> is zero, <code>IdrInterval</code> is undefined.</td>
</tr>
<tr>
<td><strong>TargetUsage</strong></td>
<td>Target usage model that guides the encoding process; see the <code>TargetUsage</code> enumerator for details.</td>
</tr>
<tr>
<td><strong>RateControlMethod</strong></td>
<td>Rate control method; see the <code>RateControlMethod</code> enumerator for details.</td>
</tr>
<tr>
<td><strong>InitialDelayInKB, BufferSizeInKB, TargetKbps, MaxKbps</strong></td>
<td>These parameters are for the constant bitrate (CBR), variable bitrate control (VBR) and CQP HRD algorithms. The SDK encoders follow the Hypothetical Reference Decoding (HRD) model. The HRD model assumes that data flows into a buffer of the fixed size <code>BufferSizeInKB</code> with a constant bitrate <code>TargetKbps</code>. (Estimate the targeted frame size by dividing the framerate by the bitrate.)</td>
</tr>
<tr>
<td></td>
<td>The decoder starts decoding after the buffer reaches the initial size <code>InitialDelayInKB</code>, which is equivalent to reaching an initial delay of <code>InitialDelayInKB * 8000 / TargetKbps</code> ms. Note: In this context, KB is 1000 bytes and Kbps is 1000 bps.</td>
</tr>
<tr>
<td></td>
<td>If <code>InitialDelayInKB</code> or <code>BufferSizeInKB</code> is equal to zero, the value is calculated using bitrate, frame rate, profile, level, and so on.</td>
</tr>
<tr>
<td></td>
<td><code>TargetKbps</code> must be specified for encoding initialization.</td>
</tr>
<tr>
<td></td>
<td>For variable bitrate control, the <code>MaxKbps</code> parameter specifies the maximum bitrate at which the encoded data enters the Video Buffering Verifier (VBV) buffer. If <code>MaxKbps</code> is equal to zero, the value is calculated from bitrate, frame rate, profile, level, and so on.</td>
</tr>
<tr>
<td><strong>QPI, QPP, QPB</strong></td>
<td>Quantization Parameters (QP) for I, P and B frames, respectively, for the constant QP (CQP) mode.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TargetKbps, Accuracy,</td>
<td>These parameters are for the average variable bitrate control (AVBR) algorithm. The algorithm focuses on overall encoding quality while meeting the specified bitrate, TargetKbps, within the accuracy range Accuracy, after a Convergence period. This method does not follow HRD and the instant bitrate is not capped or padded.</td>
</tr>
<tr>
<td>Convergence</td>
<td>The Accuracy value is specified in the unit of tenth of percent. The Convergence value is specified in the unit of 100 frames.</td>
</tr>
<tr>
<td>ICQuality</td>
<td>This parameter is for Intelligent Constant Quality (ICQ) bitrate control algorithm. It is value in the 1…51 range, where 1 corresponds the best quality.</td>
</tr>
<tr>
<td>BufferSizeInKB</td>
<td>BufferSizeInKB represents the maximum possible size of any compressed frames.</td>
</tr>
<tr>
<td>NumSlice</td>
<td>Number of slices in each video frame; each slice contains one or more macro-block rows. If NumSlice equals zero, the encoder may choose any slice partitioning allowed by the codec standard. See also mfxExtCodingOption2::NumMbPerSlice.</td>
</tr>
<tr>
<td>NumRefFrame</td>
<td>Number of reference frames; if NumRefFrame = 0, this parameter is not specified.</td>
</tr>
<tr>
<td>EncodedOrder</td>
<td>If not zero, EncodedOrder specifies that ENCODE takes the input surfaces in the encoded order and uses explicit frame type control. Application still must provide GopRefDist and mfxExtCodingOption2::BRefType so SDK can pack headers and build reference lists correctly.</td>
</tr>
<tr>
<td>NumThread</td>
<td>Deprecated; Used to represent the number of threads the underlying implementation can use on the host processor. Always set this parameter to zero.</td>
</tr>
<tr>
<td>DecodedOrder</td>
<td>For AVC and HEVC, used to instruct the decoder to return output frames in the decoded order. Deprecated and must be zero for all other decoders.</td>
</tr>
<tr>
<td>ExtendedPicStruct</td>
<td>Instructs DECODE to output extended picture structure values for additional display attributes. See the PicStruct description for details.</td>
</tr>
<tr>
<td>TimeStampCalc</td>
<td>Time stamp calculation method; see the TimeStampCalc description for details.</td>
</tr>
<tr>
<td>SliceGroupsPresent</td>
<td>Nonzero value indicates that slice groups are present in the bitstream. Only AVC decoder uses this field.</td>
</tr>
<tr>
<td>MaxDecFrameBuffering</td>
<td>Nonzero value specifies the maximum required size of the decoded picture buffer in frames for AVC and HEVC decoders.</td>
</tr>
<tr>
<td>EnableReallocRequest</td>
<td>For decoders supporting dynamic resolution change (VP9), set this option to ON to allow MFXVideoDECODE_DecodeFrameAsync return MFX_ERR_REALLOC_SURFACE.</td>
</tr>
</tbody>
</table>

Change History

This structure is available since SDK API 1.0.

SDK API 1.1 extended the QPI, QPP, QPB fields.

SDK API 1.3 extended the Accuracy, Convergence, TimeStampCalc, ExtendedPicStruct and BRCParamMultiplier fields.

SDK API 1.6 added SliceGroupsPresent field.

SDK API 1.8 added ICQuality field.

SDK API 1.15 adds LowPower field.

SDK API 1.16 adds MaxDecFrameBuffering field.

SDK API 1.19 adds EnableReallocRequest field.

Example 15: Pseudo-Code for GOP Structure Parameters
mfxU16 get_gop_sequence (...) {
    pos=display_frame_order;
    if (pos == 0)
        return MFX_FRAMETYPE_I | MFX_FRAMETYPE_IDR | MFX_FRAMETYPE_REF;
    /* Only I-frames */
    if (GopPicSize == 1)
        return MFX_FRAMETYPE_I | MFX_FRAMETYPE_REF;
    if (GopPicSize == 0)
        frameInGOP = pos; //Unlimited GOP
    else
        frameInGOP = pos%GopPicSize;
    if (frameInGOP == 0)
        return MFX_FRAMETYPE_I | MFX_FRAMETYPE_REF;
    if (GopRefDist == 1 || GopRefDist == 0) // Only I,P frames
        return MFX_FRAMETYPE_P | MFX_FRAMETYPE_REF;
    frameInPattern = (frameInGOP-1)%GopRefDist;
    if (frameInPattern == GopRefDist - 1)
        return MFX_FRAMETYPE_P | MFX_FRAMETYPE_REF;
    return MFX_FRAMETYPE_B;
}

mfxInfoVPP
Definition
typedef struct _mfxInfoVPP {
    mfxU32 reserved[8];
    mfxFrameInfo In;
    mfxFrameInfo Out;
} mfxInfoVPP;

Description
The mfxInfoVPP structure specifies configurations for video processing. A zero value in any of the fields indicates that the corresponding field is not explicitly specified.

Members
In  Input format for video processing
Out Output format for video processing

Change History
This structure is available since SDK API 1.0.

mfxInitParam
Definition
typedef struct {
    mfxIMPL          Implementation;
    mfxVersion       Version;
    mfxU16            ExternalThreads;
    union {
        struct {
            mfxExtBuffer **ExtParam;
            mfxU16 NumExtParam;
        };
        mfxU16 reserved2[5];
    };
    mfxU16            GPUCopy;
    mfxU16            reserved[20];
} mfxInitParam;

Description
The mfxInitParam structure specifies advanced initialization parameters. A zero value in any of the fields indicates that the corresponding field is not explicitly specified.

Members
Implementation  mfxIMPL enumerator that indicates the desired SDK implementation
Version  Structure which specifies minimum library version or zero, if not specified
### ExternalThreads
Desired threading mode. Value 0 means internal threading, 1 - external.

### NumExtParam
The number of extra configuration structures attached to this structure.

### ExtParam
Points to an array of pointers to the extra configuration structures; see the `ExtendedBufferID` enumerator for a list of extended configurations.

### GPUCopy
Enables or disables GPU accelerated copying between video and system memory in the SDK components. See the `GPUCopy` enumerator for a list of valid values.

#### Change History
This structure is available since SDK API 1.14.
The SDK API 1.15 adds `NumExtParam` and `ExtParam` fields.
The SDK API 1.16 adds `GPUCopy` field.

### mfxPlatform

#### Definition
```c
typedef struct {
    mfxU16 CodeName;
    mfxU16 DeviceId;
    mfxU16 reserved[14];
} mfxPlatform;
```

#### Description
The `mfxPlatform` structure contains information about hardware platform.

#### Members
- **CodeName**: Intel® processor microarchitecture codename. See the `PlatformCodeName` enumerator for a list of possible values.
- **DeviceId**: Reserved.

#### Change History
This structure is available since SDK API 1.19.

### mfxPayload

#### Definition
```c
typedef struct {
    mfxU32      CtrlFlags;
    mfxU32      reserved[3];
    mfxU8       *Data; /* buffer pointer */
    mfxU32      NumBit; /* number of bits */
    mfxU16      Type; /* SEI message type in H.264 or user data start_code in MPEG-2 */
    mfxU16      BufSize; /* payload buffer size in bytes */
} mfxPayload;
```

#### Description
The `mfxPayload` structure describes user data payload in MPEG-2 or SEI message payload in H.264. For encoding, these payloads can be inserted into the bitstream. The payload buffer must contain a valid formatted payload. For H.264, this is the sei_message() as specified in the section 7.3.2.3.1 "Supplemental enhancement information message syntax" of the ISO/IEC 14496-10 specification. For MPEG-2, this is the section 6.2.2.2.2 "User data" of the ISO/IEC 13818-2 specification, excluding the user data start_code. For decoding, these payloads can be retrieved as the decoder parses the bitstream and caches them in an internal buffer.

Payloads insertion support in encoders:

#### Codec Supported Types
- MPEG20x01B2 //User Data
### Members

<table>
<thead>
<tr>
<th>Type</th>
<th>MPEG-2 user data start code or H.264 SEI message type</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumBit</td>
<td>Number of bits in the payload data</td>
</tr>
<tr>
<td>Data</td>
<td>Pointer to the actual payload data buffer</td>
</tr>
<tr>
<td>BufSize</td>
<td>Payload buffer size in bytes</td>
</tr>
<tr>
<td>CtrlFlags</td>
<td>Additional payload properties. See the PayloadCtrlFlags enumerator for details.</td>
</tr>
</tbody>
</table>

#### Change History

This structure is available since SDK API 1.0.

The SDK API 1.19 adds CtrlFlags field.

### mfxVersion

#### Definition

```c
typedef union _mfxVersion {
    struct {
        mfxU16    Minor;
        mfxU16    Major;
    };
    mfxU32    Version;
} mfxVersion;
```

#### Description

The `mfxVersion` structure describes the version of the SDK implementation.

#### Members

<table>
<thead>
<tr>
<th>Version</th>
<th>SDK implementation version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Major</td>
<td>Major number of the SDK implementation</td>
</tr>
<tr>
<td>Minor</td>
<td>Minor number of the SDK implementation</td>
</tr>
</tbody>
</table>

#### Change History

This structure is available since SDK API 1.0.
typedef struct {
    mfxU32 AllocId;
    mfxU32 reserved[2];
    mfxU16 reserved3;
    mfxU16 AsyncDepth;
    union {
        mfxInfoMFX mfx;
        mfxInfoVPP vpp;
    }
    mfxU16 Protected;
    mfxU16 IOPattern;
    mfxExtBuffer **ExtParam;
    mfxU16 NumExtParam;
    mfxU16 reserved2;
} mfxVideoParam;

Description
The mfxVideoParam structure contains configuration parameters for encoding, decoding, transcoding and video processing.

Members
AllocId Unique component ID that will be passed by SDK to mfxFrameAllocRequest. Useful in pipelines where several components of the same type share the same allocator.
AsyncDepth Specifies how many asynchronous operations an application performs before the application explicitly synchronizes the result. If zero, the value is not specified.
mfx Configurations related to encoding, decoding and transcoding; see the definition of the mfxInfoMFX structure for details.
vpp Configurations related to video processing; see the definition of the mfxInfoVPP structure for details.
Protected Specifies the content protection mechanism; this is a reserved parameter. Its value must be zero.
IOPattern Input and output memory access types for SDK functions; see the enumerator IOPattern for details. This parameter is a mandated input for QueryIOSurf and Init functions. For DECODE, the output pattern must be specified; for ENCODE, the input pattern must be specified; and for VPP, both input and output pattern must be specified.
NumExtParam The number of extra configuration structures attached to this structure.
ExtParam Points to an array of pointers to the extra configuration structures; see the ExtendedBufferID enumerator for a list of extended configurations.

The list of extended buffers should not contain duplicated entries, i.e. entries of the same type. If mfxVideoParam structure is used to query the SDK capability, then list of extended buffers attached to input and output mfxVideoParam structure should be equal, i.e. should contain the same number of extended buffers of the same type.

Change History
This structure is available since SDK API 1.0. SDK API 1.1 extended the AsyncDepth field.
SDK API 1.17 adds AllocId field.

mfxVPPStat
Definition
typedef struct _mfxVPPStat {
    mfxU32 reserved[16];
    mfxU32 NumFrame;
    mfxU32 NumCachedFrame;
} mfxVPPStat;

Description
The mfxVPPStat structure returns statistics collected during video processing.

Members
NumFrame Total number of frames processed
NumCachedFrame Number of internally cached frames

Change History
This structure is available since SDK API 1.0.

mfxENCInput
Definition
**typedef struct _mfxENCInput mfxENCInput;**

**struct _mfxENCInput{**
  mfxU32  reserved[32];
  mfxFrameSurface1 *InSurface;
  mfxU16  NumFrameL0;
  mfxFrameSurface1 **L0Surface;
  mfxU16  NumFrameL1;
  mfxFrameSurface1 **L1Surface;
  mfxU16  NumExtParam;
  mfxExtBuffer    **ExtParam;
};**

**Description**

The **mfxENCInput** structure specifies input for the **ENC** class of functions.

**Members**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InSurface</td>
<td>Input surface.</td>

<td>Number of extended buffers.</td>
</tr>
<tr>
<td>ExtParam</td>
<td>List of extended buffers.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.10.

**mfxENCOoutput**

**Definition**

**typedef struct _mfxENCOoutput mfxENCOoutput;**

**struct _mfxENCOoutput{**
  mfxU32  reserved[32];
  mfxU16  NumExtParam;
  mfxExtBuffer    **ExtParam;
};**

**Description**

The **mfxENCOoutput** structure specifies output of the **ENC** class of functions.

**Members**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumExtParam</td>
<td>Number of extended buffers.</td>
</tr>
<tr>
<td>ExtParam</td>
<td>List of extended buffers.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.10.

**mfxExtLAControl**

**Definition**

**typedef struct**

```c
{
  mfxExtBuffer    Header;
  mfxU16  LookAheadDepth;
  mfxU16  DependencyDepth;
  mfxU16  DownScaleFactor;
  mfxU16  BPyramid;
  mfxU16  reserved1[23];
  mfxU16  NumOutStream;
  struct mfxStream{
    mfxU16  Width;
    mfxU16  Height;
    mfxU16  reserved2[14];
  } OutStream[16];
} mfxExtLAControl;
```
Description

The mfxExtLAControl structure is used to control standalone look ahead behavior. This LA is performed by ENC class of functions and its results are used later by ENCODE class of functions to improve coding efficiency.

This LA is intended for one to N transcoding scenario, where one input bitstream is transcoded to several output ones with different bitrates and resolutions. Usage of integrated into the SDK encoder LA in this scenario is also possible but not efficient in term of performance and memory consumption. Standalone LA by ENC class of functions is executed only once for input bitstream in contrast to the integrated LA where LA is executed for each of output streams.

This structure is used at ENC initialization time and should be attached to the mfxVideoParam structure.

The algorithm of QP calculation is the following:

1. Analyze LookAheadDepth frames to find per-frame costs using a sliding window of DependencyDepth frames.
2. After such analysis we have costs for \((\text{LookAheadDepth} - \text{DependencyDepth})\) frames. Cost is the estimation of frame complexity based on inter-prediction.
3. Calculate QP for the first frame using costs of \((\text{LookAheadDepth} - \text{DependencyDepth})\) frames.

Figure 6: LookAhead BRC QP Calculation Algorithm

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_LOOKAHEAD_CTRL.</td>
</tr>
<tr>
<td>LookAheadDepth</td>
<td>Look ahead depth. This parameter has exactly the same meaning as LookAheadDepth in the mfxExtCodingOption2 structure.</td>
</tr>
<tr>
<td>DependencyDepth</td>
<td>Dependency depth. This parameter specifies the number of frames that SDK analyzes to calculate inter-frame dependency. The recommendation is to set this parameter in the following range: greater than ((\text{GopRefDist} + 1)) and less than ((\text{LookAheadDepth/4})).</td>
</tr>
<tr>
<td>DownScaleFactor</td>
<td>Down scale factor. This parameter has exactly the same meaning as LookAheadDS in the mfxExtCodingOption2 structure. It is recommended to execute LA on downscaled image to improve performance without significant quality degradation.</td>
</tr>
<tr>
<td>BPYramid</td>
<td>Turn ON this flag to enable BPYramid feature (this mode is not supported by h264 encoder). See the CodingOptionValue enumerator for values of this option.</td>
</tr>
<tr>
<td>NumOutStream</td>
<td>Number of output streams in one to N transcode scenario.</td>
</tr>
<tr>
<td>OutStream</td>
<td>Output stream parameters.</td>
</tr>
<tr>
<td>Width</td>
<td>Output stream width.</td>
</tr>
<tr>
<td>Height</td>
<td>Output stream height.</td>
</tr>
</tbody>
</table>

Change History

This structure is available since SDK API 1.10.

The SDK API 1.15 adds BPYramid field.

mfxExtLAFrameStatistics

Definition
```c
typedef struct {
    mfxU16 Width;
    mfxU16 Height;
    mfxU32 FrameType;
    mfxU32 FrameDisplayOrder;
    mfxU32 FrameEncodeOrder;
    mfxU32 IntraCost;
    mfxU32 InterCost;
    mfxU32 DependencyCost;
    mfxU16 Layer;
    mfxU16 reserved[23];
    mfxU64 EstimatedRate[52];
} mfxLAFrameInfo;

typedef struct {
    mfxExtBuffer    Header;
    mfxU16 reserved[20];
    mfxU16 NumAlloc;
    mfxU16 NumStream;
    mfxU16 NumFrame;
    mfxLAFrameInfo   *FrameStat;
    mfxFrameSurface1 *OutSurface;
} mfxExtLAFrameStatistics;
```

**Description**

The `mfxExtLAFrameStatistics` structure is used to pass standalone look ahead statistics to the SDK encoder in one to N transcode scenario. This structure is used at runtime and should be attached to the `mfxENCOutput` structure and then passed, attached, to the `mfxEncodeCtrl` structure.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Estimated rate for each QP.</td>
</tr>
<tr>
<td>OutSurface</td>
<td>Output surface.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.10.

The SDK API 1.15 adds `Layer` field.
typedef struct {
    mfxExtBuffer    Header;
    mfxU16          Mode;
    mfxU16          InField;
    mfxU16          OutField;
    mfxU16          reserved[25];
} mfxExtVPPFieldProcessing;

**Description**

The `mfxExtVPPFieldProcessing` structure configures the VPP field processing algorithm. The application can attach this extended buffer to the `mfxVideoParam` structure to configure initialization and/or to the `mfxFrameData` during runtime, runtime configuration has priority over initialization configuration. If field processing algorithm was activated via `mfxExtVPPDoUse` structure and `mfxExtVPPFieldProcessing` extended buffer was not provided during initialization, this buffer must be attached to `mfxFrameData` of each input surface.

**Members**

<table>

</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.11.

**mfxExtMBQP**

**Definition**

typedef struct {
    mfxExtBuffer    Header;
    mfxU32 reserved[11];
    mfxU32 NumQPAlloc;
    union {
        mfxU8  *QP;
        mfxU64 reserved2;
    };
} mfxExtMBQP;

**Description**

The `mfxExtMBQP` structure specifies per-macroblock QP for current frame if `mfxExtCodingOption3::EnableMBQP` was turned ON during encoder initialization. The application can attach this extended buffer to the `mfxEncodeCtrl` during runtime.

**Members**

<table>
<thead>
<tr>
<th>Member</th>

</tr>
<tr>
<td></td>
<td>For HEVC valid range is 1..51. Application's provided QP values should be valid; otherwise invalid QP values may cause undefined behavior. MBQP map should be aligned for 16x16 block size. (align rule is (width +15 /16) &amp;&amp; (height +15 /16))</td>
</tr>
<tr>
<td></td>
<td>For MPEG2 QP corresponds to quantizer_scale of the ISO/IEC 13818-2 specification and have valid range 1..112.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.13.

**mfxExtMBForceIntra**

**Definition**
typedef struct {
    mfxExtBuffer Header;
    mfxU32 reserved[11];
    mfxU32 MapSize;
    union {
        mfxU8  *Map;
        mfxU64  reserved2;
    };
} mfxExtMBForceIntra;

**Description**

The **mfxExtMBForceIntra** structure specifies macroblock map for current frame which forces specified macroblocks to be encoded as Intra if `mfxExtCodingOption3::EnableMBForceIntra` was turned ON during encoder initialization. The application can attach this extended buffer to the `mfxEncodeCtrl` during runtime.

**Members**

<table>

This structure is available since SDK API 1.13.

---

**mfxExtHEVCTiles**

**Definition**

typedef struct {
    mfxExtBuffer Header;
    mfxU16 NumTileRows;
    mfxU16 NumTileColumns;
    mfxU16 reserved[74];
} mfxExtHEVCTiles;

**Description**

The **mfxExtHEVCTiles** structure configures tiles options for the HEVC encoder. The application can attach this extended buffer to the `mfxVideoParam` structure to configure initialization.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be <code>MFX_EXTBUFF_HEVC_TILES</code>.</td>

**mfxExtMBDisableSkipMap**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU32 reserved[11];
    mfxU32 MapSize;
    union {
        mfxU8  *Map;
        mfxU64  reserved2;
    };
} mfxExtMBDisableSkipMap;
```

**Description**

The `mfxExtMBDisableSkipMap` structure specifies macroblock map for current frame which forces specified macroblocks to be non skip if `mfxExtCodingOption3::MBDisableSkipMap` was turned ON during encoder initialization. The application can attach this extended buffer to the `mfxEncodeCtrl` during runtime.

**Members**

- **Header.BufferId**: Must be `MFX_EXTBUFF_MB_DISABLE_SKIP_MAP`.
- **MapSize**: Macroblock map size.
- **Map**: Pointer to a list of non-skip macroblock flags in raster scan order. Each flag is one byte in map. Set flag to 1 to force corresponding macroblock to be non-skip. In case of interlaced encoding the first half of map affects top field and the second – bottom field.

**Change History**

This structure is available since SDK API 1.13.

**mfxExtDecodedFrameInfo**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16       FrameType;
    mfxU16       reserved[59];
} mfxExtDecodedFrameInfo;
```

**Description**

This structure is used by the SDK decoders to report additional information about decoded frame. The application can attach this extended buffer to the `mfxFrameSurface1::mfxFrameData` structure at runtime.

**Members**

- **Header.BufferId**: Must be `MFX_EXTBUFF_DECODED_FRAME_INFO`.
- **FrameType**: Frame type. See `FrameType` enumerator for the list of possible types.

**Change History**

This structure is available since SDK API 1.14.

**mfxExtTimeCode**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16       DropFrameFlag;
    mfxU16       TimeCodeHours;
    mfxU16       TimeCodeMinutes;
    mfxU16       TimeCodeSeconds;
    mfxU16       TimeCodePictures;
    mfxU16       reserved[7];
} mfxExtTimeCode;
```

**Description**

This structure is used by the SDK to pass MPEG 2 specific timing information.
Members

<table>

Change History

This structure is available since SDK API 1.14.

**mfxExtHEVCRegion**

Definition

```c
enum {
    MFX_HEVC_REGION_ENCODING_ON = 0,
    MFX_HEVC_REGION_ENCODING_OFF = 1
};

typedef struct {
    mfxExtBuffer Header;
    mfxU32       RegionId;
    mfxU16       RegionType;
    mfxU16       RegionEncoding;
    mfxU16       reserved[24];
} mfxExtHEVCRegion;
```

Description

Attached to the mfxVideoParam structure during HEVC encoder initialization, specifies the region to encode.

Members

<table>
<thead>
<tr>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_HEVC_REGION.</td>
</tr>
<tr>
<td>RegionId</td>
<td>Id of region.</td>
</tr>
<tr>
<td>RegionType</td>
<td>Type of region. See HEVCRegionType enumerator for the list of possible types.</td>
</tr>
<tr>
<td>RegionEncoding</td>
<td>Set to MFX_HEVC_REGION_ENCODING_ON to encode only specified region.</td>
</tr>
</tbody>
</table>

Change History

This structure is available since SDK API 1.15. The SDK API 1.16 adds RegionEncoding field.

**mfxExtThreadsParam**

Definition

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16       NumThread;
    mfxI32       SchedulingType;
    mfxI32       Priority;
    mfxU16       reserved[55];
} mfxExtThreadsParam;
```

Description

Attached to the mfxInitParam structure during the SDK session initialization, mfxExtThreadsParam structure specifies options for threads created by this session.

Members

<table>
<thead>
<tr>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_THREADS_PARAM.</td>
</tr>
<tr>
<td>NumThread</td>
<td>The number of threads.</td>
</tr>
<tr>
<td>SchedulingType</td>
<td>Scheduling policy for all threads.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority for all threads.</td>
</tr>
</tbody>
</table>

Change History

This structure is available since SDK API 1.15.

**mfxExtHEVCParam**

Definition
```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16 PicWidthInLumaSamples;
    mfxU16 PicHeightInLumaSamples;
    mfxU64 GeneralConstraintFlags;
    mfxU16 SampleAdaptiveOffset;
    mfxU16 LCUSize;
    mfxU16 reserved[116];
} mfxExtHEVCParam;
```

**Description**
Attached to the `mfxVideoParam` structure extends it with HEVC-specific parameters. Used by both decoder and encoder.

**Members**
- **Header.BufferId** Must be `MFX_EXTBUFF_HEVC_PARAM`.
- **PicWidthInLumaSamples** Specifies the width of each coded picture in units of luma samples.
- **PicHeightInLumaSamples** Specifies the height of each coded picture in units of luma samples.
- **GeneralConstraintFlags** Additional flags to specify exact profile/constraints. See the `GeneralConstraintFlags` enumerator for values of this field.
- **SampleAdaptiveOffset** Controls SampleAdaptiveOffset encoding feature. See enum `SampleAdaptiveOffset` for supported values (bit-ORed). Valid during encoder `Init` and `Runtime`.
- **LCUSize** Specifies largest coding unit size (max luma coding block). Valid during encoder `Init`.

**Change History**
This structure is available since SDK API 1.14.

The SDK API 1.16 adds `GeneralConstraintFlags` field.

The SDK API 1.26 adds `SampleAdaptiveOffset` and `LCUSize` fields.

---

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16 LumaLog2WeightDenom;  // 0..7
    mfxU16 ChromaLog2WeightDenom;  // 0..7
    mfxU16 LumaWeightFlag[2][32];  // [list] 0,1
    mfxU16 ChromaWeightFlag[2][32];  // [list] 0,1
    mfxI16 Weights[2][32][3][2];  // [list][list entry][Y, Cb, Cr][weight, offset]
    mfxU16 reserved[58];
} mfxExtPredWeightTable;
```

**Description**
When `mfxExtCodingOption3::WeightedPred` was set to `explicit` during encoder `Init` or `Reset` and the current frame is P-frame or `mfxExtCodingOption3::WeightedBiPred` was set to `explicit` during encoder `Init` or `Reset` and the current frame is B-frame, attached to `mfxEncodeCtrl`, this structure specifies weighted prediction table for current frame.

**Members**
- **Header.BufferId** Must be `MFX_EXTBUFF_PRED_WEIGHT_TABLE`.
- **LumaLog2WeightDenom** Base 2 logarithm of the denominator for all luma weighting factors. Value shall be in the range of 0 to 7, inclusive.
- **ChromaLog2WeightDenom** Base 2 logarithm of the denominator for all chroma weighting factors. Value shall be in the range of 0 to 7, inclusive.
- **LumaWeightFlag** `LumaWeightFlag[L][R]` equal to 1 specifies that the weighting factors for the luma component are specified for R's entry of RefPicList L.
- **ChromaWeightFlag** `ChromaWeightFlag[L][R]` equal to 1 specifies that the weighting factors for the chroma component are specified for R's entry of RefPicList L.
- **Weights** The values of the weights and offsets used in the encoding processing. The value of `Weights[i][j][k][m]` is interpreted as: i refers to reference picture list 0 or 1; j refers to reference list entry 0-31; k refers to data for the luma component when it is 0, the Cb chroma component when it is 1 and the Cr chroma component when it is 2; m refers to weight when it is 0 and offset when it is 1

**Change History**
This structure is available since SDK API 1.16.
mfxExtAVCRoundingOffset

**Definition**

typedef struct {
  mfxExtBuffer Header;
  mfxU16 EnableRoundingIntra; // tri-state option
  mfxU16 RoundingOffsetIntra; // valid value [0,7]
  mfxU16 EnableRoundingInter; // tri-state option
  mfxU16 RoundingOffsetInter; // valid value [0,7]
  mfxU16 reserved[24];
} mfxExtAVCRoundingOffset;

**Description**

This structure is used by the SDK encoders to set rounding offset parameters for quantization. It is per-frame based encoding control, and can be attached to some frames and skipped for others. When the extension buffer is set the application can attach it to the mfxEncodeCtrl during runtime.

**Members**

- **Header.BufferId** Must be MFX_EXTBUFF_AVC_ROUNDING_OFFSET.
- **EnableRoundingIntra** Enable rounding offset for intra blocks. See the CodingOptionValue enumerator for values of this option.
- **RoundingOffsetIntra** Intra rounding offset. Value shall be in the range of 0 to 7, inclusive.
- **EnableRoundingInter** Enable rounding offset for inter blocks. See the CodingOptionValue enumerator for values of this option.
- **RoundingOffsetInter** Inter rounding offset. Value shall be in the range of 0 to 7, inclusive.

**Change History**

This structure is available since SDK API 1.27.

mfxExtDirtyRect

**Definition**

typedef struct {
  mfxExtBuffer Header;
  mfxU16 NumRect;
  mfxU16 reserved1[11];
  struct {
    mfxU32 Left;
    mfxU32 Top;
    mfxU32 Right;
    mfxU32 Bottom;
    mfxU16 reserved2[8];
  } Rect[256];
} mfxExtDirtyRect;

**Description**

Used by the application to specify dirty regions within a frame during encoding. It may be used at initialization or at runtime.

**Members**

- **Header.BufferId** Must be MFX_EXTBUFF_DIRTY_RECTANGLES.
- **NumRect** Number of dirty rectangles.
- **Rect** Array of dirty rectangles.
- **Left, Top, Right, Bottom** Dirty region location. Dirty rectangle definition is using end-point exclusive notation. In other words, the pixel with (Right, Bottom) coordinates lies immediately outside of the Dirty rectangle. Left, Top, Right, Bottom should be aligned by codec-specific block boundaries (should be dividable by 16 for AVC, or by block size (8, 16, 32 or 64, depends on platform) for HEVC). Every Dirty rectangle with unaligned coordinates will be expanded by SDK to minimal-area block-aligned Dirty rectangle, enclosing the original one. For example (5, 5, 15, 31) Dirty rectangle will be expanded to (0, 0, 16, 32) for AVC encoder, or to (0, 0, 32, 32) for HEVC, if block size is 32. Dirty rectangle (0, 0, 0, 0) is a valid dirty rectangle and means that frame is not changed.

**Change History**

This structure is available since SDK API 1.16. The SDK API 1.25 adds clarification that Dirty rectangle Right, Bottom are considered exclusive and alignment
rules changed. Added clarification about (0, 0, 0, 0) Dirty rectangle case.

**mfxExtMoveRect**

**Definition**

typedef struct {
    mfxExtBuffer Header;
    mfxU16  NumRect;
    mfxU16  reserved1[11];
    struct {
        mfxU32  DestLeft;
        mfxU32  DestTop;
        mfxU32  DestRight;
        mfxU32  DestBottom;
        mfxU32  SourceLeft;
        mfxU32  SourceTop;
        mfxU16  reserved2[4];
    } Rect[256];
} mfxExtMoveRect;

**Description**

Used by the application to specify moving regions within a frame during encoding.

**Members**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_MOVING_RECTANGLES.</td>

<td>Number of moving rectangles.</td>
</tr>
<tr>
<td>Rect</td>
<td>Array of moving rectangles.</td>
</tr>
<tr>
<td>DestLeft, DestTop, DestRight, DestBottom</td>
<td>Destination rectangle location. Should be aligned to MB boundaries (should be dividable by 16). If not, the SDK encoder truncates it to MB boundaries, for example, both 17 and 31 will be truncated to 16.</td>
</tr>
<tr>
<td>SourceLeft, SourceTop</td>
<td>Source rectangle location.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.16.

**mfxExtCodingOptionVPS**

**Definition**

typedef struct {
    mfxExtBuffer    Header;
    union {
        mfxU8       *VPSBuffer;
        mfxU64      reserved1;
    };
    mfxU16          VPSBufSize;
    mfxU16          VPSId;
    mfxU16          reserved[6];
} mfxExtCodingOptionVPS;

**Description**

Attach this structure as part of the extended buffers to configure the SDK encoder during MFXVideoENCODE_Init. The sequence or picture parameters specified by this structure overwrite any such parameters specified by the structure or any other extended buffers attached therein.

If the encoder does not support the specified parameters, the encoder does not initialize and returns the status code MFX_ERR_INCOMPATIBLE_VIDEO_PARAM.

Check with the MFXVideoENCODE_Query function for the support of this multiple segment encoding feature. If this feature is not supported, the query returns MFX_ERR_UNSUPPORTED.

**Members**

</table>
**mfxExtVPPRotation**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16 Angle;
    mfxU16 reserved[11];
} mfxExtVPPRotation;
```

**Description**

The `mfxExtVPPRotation` structure configures the VPP Rotation filter algorithm.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VPP_ROTATION`
- **Angle** Rotation angle. See `Angle` enumerator for supported values.

**Change History**

This structure is available since SDK API 1.17.

**mfxExtVPPScaling**

**Definition**

```c
/* ScalingMode */
enum {
    MFX_SCALING_MODE_DEFAULT    = 0,
    MFX_SCALING_MODE_LOWPOWER   = 1,
    MFX_SCALING_MODE_QUALITY    = 2
};

typedef struct {
    mfxExtBuffer Header;
    mfxU16 ScalingMode;
    mfxU16 reserved[11];
} mfxExtVPPScaling;
```

**Description**

The `mfxExtVPPScaling` structure configures the VPP Scaling filter algorithm.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VPP_SCALING`
- **ScalingMode** Scaling mode

**Change History**

This structure is available since SDK API 1.19.

**mfxExtVPPMirroring**

**Definition**

```c
/* MirroringType */
enum {
    MFX_MIRRORING_DISABLED   = 0,
    MFX_MIRRORING_HORIZONTAL = 1,
    MFX_MIRRORING_VERTICAL   = 2
};

typedef struct {
    mfxExtBuffer Header;
    mfxU16 Type;
    mfxU16 reserved[11];
} mfxExtVPPMirroring;
```

**Description**

The `mfxExtVPPMirroring` structure configures the VPP Mirroring filter algorithm.
Members
Header.BufferId Must be MFX_EXTBUFF_VPP_MIRRORING

Type Mirroring type

Change History
This structure is available since SDK API 1.19.

mfxExtVPPColorFill
Definition
typedef struct {
    mfxExtBuffer Header;
    mfxU16 Enable; /* tri-state option */
    mfxU16 reserved[11];
} mfxExtVPPColorFill;

Description
The mfxExtVPPColorFill structure configures the VPP ColorFill filter algorithm.

Members
Header.BufferId Must be MFX_EXTBUFF_VPP_COLORFILL
Enable Set to ON makes VPP fill the area between Width/Height and Crop borders.
See the CodingOptionValue enumerator for values of this option.

Change History
This structure is available since SDK API 1.19.

mfxExtEncodedSlicesInfo
Definition
typedef struct {
    mfxExtBuffer Header;
    mfxU16 SliceSizeOverflow;
    mfxU16 NumSliceNonCopliant;
    mfxU16 NumEncodedSlice;
    mfxU16 NumSliceSizeAlloc;
    union {
        mfxU16 *SliceSize;
        mfxU64 reserved1;
    };
    mfxU16 reserved[20];
} mfxExtEncodedSlicesInfo;

Description
The mfxExtEncodedSlicesInfo is used by the SDK encoder to report additional information about encoded slices. The application can attach this buffer to the mfxBitstream structure before calling MFXVideoENCODE_EncodeFrameAsync function.

Not all implementations of the SDK encoder support this extended buffer. The application has to use query mode 1 to determine if such functionality is supported. To do so, the application has to attach this extended buffer to mfxVideoParam structure and call MFXVideoENCODE_Query function. If function returns MFX_ERR_NONE then such functionality is supported.

Members
Header.BufferId Must be MFX_EXTBUFF_ENCODED_SLICES_INFO
SliceSizeOverflow When mfxExtCodingOption2::MaxSliceSize is used, indicates the requested slice size was not met for one or more generated slices
NumSliceNonCopliant When mfxExtCodingOption2::MaxSliceSize is used, indicates the number of generated slices exceeds specification limits
NumEncodedSlice Number of encoded slices.
NumSliceSizeAlloc SliceSize array allocation size. Must be specified by application.
SliceSize Slice size in bytes. Array must be allocated by application.

Change History
This structure is available since SDK API 1.19.
**mfxExtMVOverPicBoundaries**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16 StickTop; /* tri-state option */
    mfxU16 StickBottom; /* tri-state option */
    mfxU16 StickLeft; /* tri-state option */
    mfxU16 StickRight; /* tri-state option */
    mfxU16 reserved[8];
} mfxExtMVOverPicBoundaries;
```

**Description**

Attached to the `mfxVideoParam` structure instructs encoder to use or not use samples over specified picture border for inter prediction.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mfxExtBuffer</td>
<td>Must be <code>MFX_EXTBUFF_MV_OVER_PIC_BOUNDARIES</code>.</td>
</tr>
<tr>
<td>StickTop, StickBottom, StickLeft, StickRight</td>
<td>When set to OFF, one or more samples outside corresponding picture boundary may be used in inter prediction. See the <code>CodingOptionValue</code> enumerator for values of this option.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.19.

**mfxExtDecVideoProcessing**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;

    struct mfxIn{
        mfxU16 CropX;
        mfxU16 CropY;
        mfxU16 CropW;
        mfxU16 CropH;
        mfxU16 reserved[12];
    } In;

    struct mfxOut{
        mfxU32 FourCC;
        mfxU16 ChromaFormat;
        mfxU16 reserved1;
        mfxU16 Width;
        mfxU16 Height;
        mfxU16 CropX;
        mfxU16 CropY;
        mfxU16 CropW;
        mfxU16 CropH;
        mfxU16 reserved[22];
    } Out;

    mfxU16 reserved[13];
} mfxExtDecVideoProcessing;
```

**Description**

If attached to the `mfxVideoParam` structure during the `Init` stage this buffer will instruct decoder to resize output frames via fixed function resize engine (if supported by HW) utilizing direct pipe connection bypassing intermediate memory operations. Main benefits of this mode of pipeline operation are offloading resize operation to dedicated engine reducing power consumption and memory traffic.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mfxExtBuffer</td>
<td>Must be <code>MFX_EXTBUFF_DEC_VIDEO_PROCESSING</code>.</td>
</tr>
<tr>
<td>In</td>
<td>Input surface description</td>
</tr>
<tr>
<td>CropX, CropY, CropW, CropH</td>
<td>Region of interest of the input surface Note: <code>CropX</code> and <code>CropY</code> must be 0</td>
</tr>
<tr>
<td>Out</td>
<td>Output surface description</td>
</tr>
<tr>
<td>FourCC</td>
<td>FourCC of output surface Note: Should be <code>MFX_FOURCC_NV12</code></td>
</tr>
</tbody>
</table>
ChromaFormat (Chroma Format of output surface)
Note: Should be MFX_CHROMAFORMAT_YUV420

Width, Height (Width and Height of output surface)

CropX, CropY, CropW, CropH (Region of interest of the output surface)

Note: There are three places for crops values already (one in mfxVideoParam and two in mfxExtDecVideoProcessing); and two for Width and Height values (in mfxVideoParam and in mfxExtDecVideoProcessing). Example of relationship between structures below.

**Example 1:** For instance, input stream has resolution 1920x1088. Need to do resize to 352x288 resolution.

```c
mfxVideoParam.Width     = 1920;
mfxVideoParam.Height    = 1088;
mfxVideoParam.CropX     = 0;
mfxVideoParam.CropY     = 0;
mfxVideoParam.CropW     = 1920;
mfxVideoParam.CropH     = 1088;
mfxExtDecVideoProcessing.In.CropX   = 0;
mfxExtDecVideoProcessing.In.CropY   = 0;
mfxExtDecVideoProcessing.In.CropW   = 1920;
mfxExtDecVideoProcessing.In.CropH   = 1088;
mfxExtDecVideoProcessing.Out.Width  = 352;
mfxExtDecVideoProcessing.Out.Height = 288;
mfxExtDecVideoProcessing.Out.CropX  = 0;
mfxExtDecVideoProcessing.Out.CropY  = 0;
mfxExtDecVideoProcessing.Out.CropW  = 352;
mfxExtDecVideoProcessing.Out.CropH  = 288;
```

**Example 2:** For instance, input stream has resolution 1920x1080. Required to do (1) cropping of decoded image to 1280x720, and then to do (2) resize 352x288 (3) into surface with SD resolution like 720x480

```c
mfxVideoParam.Width     = 1920;
mfxVideoParam.Height    = 1088;
mfxVideoParam.CropX     = 0;
mfxVideoParam.CropY     = 0;
mfxVideoParam.CropW     = 1920;
mfxVideoParam.CropH     = 1080;
mfxExtDecVideoProcessing.In.CropX   = 0;
mfxExtDecVideoProcessing.In.CropY   = 0;
mfxExtDecVideoProcessing.In.CropW   = 1280;
mfxExtDecVideoProcessing.In.CropH   = 720;
mfxExtDecVideoProcessing.Out.Width  = 720;
mfxExtDecVideoProcessing.Out.Height = 480;
mfxExtDecVideoProcessing.Out.CropX  = 0;
mfxExtDecVideoProcessing.Out.CropY  = 0;
mfxExtDecVideoProcessing.Out.CropW  = 352;
mfxExtDecVideoProcessing.Out.CropH  = 288;
```

**Change History**
This structure is available since SDK API 1.22.

**mfxExtVP9Param**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16  FrameWidth;
    mfxU16  FrameHeight;
    mfxU16  WriteIVFHeaders;  /* tri-state option */
    mfxI16  QIndexDeltaLumaDC;
    mfxI16  QIndexDeltaChromaAC;
    mfxI16  QIndexDeltaChromaDC;
    mfxU16  reserved[112];
} mfxExtVP9Param;
```

**Description**

Attached to the mfxVideoParam structure extends it with VP9-specific parameters. Used by both decoder and encoder.

**Members**

- **Header.BufferId** Must be MFX_EXTBUFF_VP9_PARAM.
FrameWidth | Width of the coded frame in pixels.
FrameHeight | Height of the coded frame in pixels.
WriteIVFHeaders | Turn this option ON to make encoder insert IVF container headers to output stream. NumFrame field of IVF sequence header will be zero, it’s responsibility of application to update it with correct value. See the CodingOptionValue enumerator for values of this option.
QIndexDeltaLumaDC, QIndexDeltaChromaAC, QIndexDeltaChromaDC | Specifies an offset for a particular quantization parameter.

Change History
This structure is available since SDK API 1.26.

mfxExtVP9Segmentation

Definition

typedef struct {
  mfxU16  FeatureEnabled;
  mfxI16  QIndexDelta;
  mfxI16  LoopFilterLevelDelta;
  mfxU16  ReferenceFrame;
  mfxU16  reserved[12];
} mfxVP9SegmentParam;

typedef struct {
  mfxExtBuffer        Header;
  mfxU16              NumSegments;
  mfxVP9SegmentParam  Segment[8];
  mfxU16              SegmentIdBlockSize;
  mfxU32              NumSegmentIdAlloc;
  union {
    mfxU8           *SegmentId;
    mfxU64          reserved1;
  };
  mfxU16  reserved[52];
} mfxExtVP9Segmentation;

Description
In VP9 encoder it’s possible to divide a frame to up to 8 segments and apply particular features (like delta for quantization index or for loop filter level) on segment basis. "Uncompressed header" of every frame indicates if segmentation is enabled for current frame, and (if segmentation enabled) contains full information about features applied to every segment. Every “Mode info block” of coded frame has segment_id in the range [0, 7].

To enable Segmentation mfxExtVP9Segmentation structure with correct settings should be passed to the encoder. It can be attached to the mfxVideoParam structure during initialization or MFXVideoENCODE_Reset call (static configuration). If the buffer isn’t attached for Reset call, encoder continues to use static configuration for segmentation which was actual before this Reset call. If mfxExtVP9Segmentation buffer with NumSegments=0 is provided during initialization or Reset call, segmentation becomes disabled for static configuration. Also the buffer can be attached to the mfxEncodeCtrl structure during runtime (dynamic configuration). Dynamic configuration is applied to current frame only (after encoding of current frame SDK Encoder will switch to next dynamic configuration, or to static configuration if dynamic isn’t provided for next frame).

Members

FeatureEnabled | Indicates which features are enabled for the segment. See SegmentFeature enumerator for values for this option. Values from the enumerator can be bit-OR’ed. Support of particular feature depends on underlying HW platform. Application can check which features are supported by calling of Query.

QIndexDelta | Quantization index delta for the segment. Ignored if MFX_VP9_SEGMENT_FEATURE_QINDEX isn’t set in FeatureEnabled. Valid range for this parameter is [-255, 255]. If QIndexDelta is out of this range, it will be ignored. If QIndexDelta is within valid range, but sum of base quantization index and QIndexDelta is out of [0, 255], QIndexDelta will be clamped.

LoopFilterLevelDelta | Loop filter level delta for the segment. Ignored if MFX_VP9_SEGMENT_FEATURE_LOOP_FILTER isn’t set in FeatureEnabled. Valid range for this parameter is [-63, 63]. If LoopFilterLevelDelta is out of this range, it will be ignored. If LoopFilterLevelDelta is within valid range, but sum of base loop filter level and LoopFilterLevelDelta is out of [0, 63], LoopFilterLevelDelta will be clamped.

ReferenceFrame | Reference frame for the segment. See VP9ReferenceFrame enumerator for values for this option. Ignored if MFX_VP9_SEGMENT_FEATURE_REFERENCE isn’t set in FeatureEnabled.
**Header.BufferId**
Must be **MFX_EXTBUFF_VP9_SEGMENTATION**.

**NumSegments**
Number of segments for frame. Value 0 means that segmentation is disabled. Sending of 0 for particular frame will disable segmentation for this frame only. Sending of 0 to **Reset** function will disable segmentation permanently (can be enabled again by subsequent **Reset** call).

**Segment**
Array of structures `mfxVP9SegmentParam` containing features and parameters for every segment. Entries with indexes bigger than `NumSegments-1` are ignored. See the `mfxVP9SegmentParam` structure for definitions of segment features and their parameters.

**SegmentIdBlockSize**, **NumSegmentIdAlloc**, **SegmentId**
These three parameters represent segmentation map. Here, segmentation map is array of segment_ids (one byte per segment_id) for blocks of size NxN in raster scan order. Size NxN is specified by application and is constant for whole frame. If `mfxExtVP9Segmentation` is attached during initialization and/or during runtime, all three parameters should be set to proper values not conflicting with each other and with `NumSegments`. If any of them not set, or any conflict/error in these parameters detected by SDK, segmentation map discarded.

**SegmentIdBlockSize**
Size of block (NxN) for segmentation map. See `SegmentIdBlockSize` enumerator for values for this option. Encoded block which is bigger than `SegmentIdBlockSize` uses segment_id taken from it’s top-left sub-block from segmentation map. Application can check if particular block size is supported by calling of **Query**.

**NumSegmentIdAlloc**
Size of buffer allocated for segmentation map (in bytes). Application must assure that `NumSegmentIdAlloc` is enough to cover frame resolution with blocks of size `SegmentIdBlockSize`. Otherwise segmentation map will be discarded.

**SegmentId**
Pointer to segmentation map buffer which holds array of segment_ids in raster scan order. Application is responsible for allocation and release of this memory. Buffer pointed by `SegmentId` provided during initialization or **Reset** call should be considered in use until another `SegmentId` is provided via **Reset** call (if any), or until call of **MFXVideoENCODE_Close**. Buffer pointed by `SegmentId` provided with `mfxEncodeCtrl` should be considered in use while input surface is locked by SDK. Every segment_id in the map should be in the range of [0, `NumSegments-1`]. If some segment_id is out of valid range, segmentation map cannot be applied. If buffer `mfxExtVP9Segmentation` is attached to `mfxEncodeCtrl` in runtime, `SegmentId` can be zero. In this case segmentation map from static configuration will be used.

**Change History**
This structure is available since SDK API 1.26.

**mfxExtVP9TemporalLayers**

**Definition**
```c
typedef struct {
    mfxU16 FrameRateScale;
    mfxU16 TargetKbps
    mfxU16 reserved[14];
} mfxVP9TemporalLayer;

typedef struct {
    mfxExtBuffer        Header;
    mfxVP9TemporalLayer Layer[8];
    mfxU16              reserved[60];
} mfxExtVP9TemporalLayers;
```

**Description**
The SDK allows to encode VP9 bitstream that contains several subset bitstreams that differ in frame rates also called “temporal layers”. On decoder side each temporal layer can be extracted from coded stream and decoded separately.

The `mfxExtVP9TemporalLayers` structure configures the temporal layers for SDK VP9 encoder. It can be attached to the `mfxVideoParam` structure during initialization or **MFXVideoENCODE_Reset** call. If `mfxExtVP9TemporalLayers` buffer isn’t attached during initialization, temporal scalability is disabled. If the buffer isn’t attached for **Reset** call, encoder continues to use temporal scalability configuration which was actual before this **Reset** call.

In SDK API temporal layers are ordered by their frame rates in ascending order. Temporal layer 0 (having lowest frame rate) is called base layer. Each next temporal layer includes all previous layers.

Temporal scalability feature has requirements for minimum number of allocated reference frames (controlled by SDK API parameter `NumRefFrame`). If `NumRefFrame` set by application isn’t enough to build reference structure for requested number of temporal layers, the SDK corrects `NumRefFrame`.

Temporal layer structure is reset (re-started) after key-frames.

**Members**
FrameRateScale
The ratio between the frame rates of the current temporal layer and the base layer. The SDK treats particular temporal layer as “defined” if it has FrameRateScale > 0. If base layer defined, it must have FrameRateScale equal to 1. FrameRateScale of each next layer (if defined) must be multiple of and greater than FrameRateScale of previous layer.

TargetKbps
Target bitrate for current temporal layer (ignored if RateControlMethod is CQP). If RateControlMethod is not CQP, application must provide TargetKbps for every defined temporal layer. TargetKbps of each next layer (if defined) must be greater than TargetKbps of previous layer.

Header.BufferId
Must be MFX_EXTBUFF_VP9_TEMPORAL_LAYERS.

Layer
The array of temporal layers. Layer[0] specifies base layer. The SDK reads layers from the array while they are defined (have FrameRateScale>0). All layers starting from first layer with FrameRateScale=0 are ignored. Last layer which is not ignored is “highest layer”. Highest layer has frame rate specified in mfxVideoParam. Frame rates of lower layers are calculated using their FrameRateScale. TargetKbps of highest layer should be equal to TargetKbps specified in mfxVideoParam. If it’s not true, TargetKbps of highest temporal layers has priority. If there are no defined layers in Layer array, temporal scalability feature is disabled. E.g. to disable temporal scalability in runtime, application should pass to Reset call mfxExtVP9TemporalLayers buffer with all FrameRateScale set to 0.

Change History
This structure is available since SDK API 1.26

**mfxExtBRC**

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU32 reserved[14];
    mfxHDL pthis;

    mfxStatus (*Init) (mfxHDL pthis, mfxVideoParam* par);
    mfxStatus (*Reset) (mfxHDL pthis, mfxVideoParam* par);
    mfxStatus (*Close) (mfxHDL pthis);
    mfxStatus (*GetFrameCtrl) (mfxHDL pthis, mfxBRCFrameParam* par, mfxBRCFrameCtrl* ctrl);
    mfxStatus (*Update) (mfxHDL pthis, mfxBRCFrameParam* par, mfxBRCFrameCtrl* ctrl,
                         mfxBRCFrameStatus* status);

    mfxHDL reserved1[10];
} mfxExtBRC;
```

**Description**

Structure contains set of callbacks to perform external bit rate control. Can be attached to mfxVideoParam structure during encoder initialization. Turn mfxExtCodingOption2::ExtBRC option ON to make encoder use external BRC instead of native one.

**Members**

- Header.BufferId
  Must be MFX_EXTBUFF_BRC.
- pthis
  Pointer to the BRC object
- Init
  Pointer to the function that initializes BRC session
- Reset
  Pointer to the function that resets initialization parameters for BRC session
- Close
  Pointer to the function that closes BRC session
- GetFrameCtrl
  Pointer to the function that returns controls required for next frame encoding
- Update
  Pointer to the function that updates BRC state after each frame encoding

Change History
This structure is available since SDK API 1.24.

**Init**

**Syntax**

```c
mfxStatus (*Init) (mfxHDL pthis, mfxVideoParam* par);
```

**Parameters**

- pthis
  Pointer to the BRC object
- par
  Pointer to the mfxVideoParam structure that was used for the encoder initialization

**Description**

This function initializes BRC session according to parameters from input mfxVideoParam and attached structures. It
Reset
Syntax
```
mfxStatus (*Reset) (mfxHDL pthis, mfxVideoParam* par);
```
Parameters
- `pthis` Pointer to the BRC object
- `par` Pointer to the `mfxVideoParam` structure that was used for the encoder reset

Description
This function resets BRC session according to new parameters. It does not modify in any way the input `mfxVideoParam` and attached structures. Invoked during `MFXVideoENCODE_Reset`.

Return Status
- `MFX_ERR_NONE` The function successfully reset BRC session.
- `MFX_ERR_UNSUPPORTED` The function detected unsupported video parameters.
- `MFX_ERR_INCOMPATIBLE_VIDEO_PARAM` The function detected that provided by the application video parameters are incompatible with initialization parameters. Reset requires additional memory allocation and cannot be executed.

Change History
This function is available since SDK API 1.24.

Close
Syntax
```
mfxStatus (*Close) (mfxHDL pthis);
```
Parameters
- `pthis` Pointer to the BRC object

Description
This function de-allocates any internal resources acquired in `Init` for this BRC session. Invoked during `MFXVideoENCODE_Close`.

Return Status
- `MFX_ERR_NONE` The function completed successfully.

Change History
This function is available since SDK API 1.24.

GetFrameCtrl
Syntax
```
mfxStatus (*GetFrameCtrl) (mfxHDL pthis, mfxBRCFrameParam* par, mfxBRCFrameCtrl* ctrl);
```
Parameters
- `pthis` Pointer to the BRC object
- `par` Pointer to the input `mfxBRCFrameParam` structure
- `ctrl` Pointer to the output `mfxBRCFrameCtrl` structure

Description
This function returns controls (`ctrl`) to encode next frame based on info from input `mfxBRCFrameParam` structure (`par`) and internal BRC state. Invoked asynchronously before each frame encoding or recoding.

Return Status
- `MFX_ERR_NONE` The function completed successfully.
**Change History**

This function is available since SDK API 1.24.

**Update**

**Syntax**

```c
mfxStatus (*Update) (mfxHDL pthis, mfxBRCFrameParam* par, mfxBRCFrameCtrl* ctrl, mfxBRCFrameStatus* status);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pthis</td>
<td>Pointer to the BRC object</td>
</tr>
<tr>
<td>par</td>
<td>Pointer to the input mfxBRCFrameParam structure</td>
</tr>
<tr>
<td>ctrl</td>
<td>Pointer to the input mfxBRCFrameCtrl structure</td>
</tr>
<tr>
<td>status</td>
<td>Pointer to the output mfxBRCFrameStatus structure</td>
</tr>
</tbody>
</table>

**Description**

This function updates internal BRC state and returns `status` to instruct encoder whether it should recode previous frame, skip it, do padding or proceed to next frame based on info from input `mfxBRCFrameParam` and `mfxBRCFrameCtrl` structures. Invoked asynchronously after each frame encoding or recoding.

**Return Status**

- `MFX_ERR_NONE` The function completed successfully.

**Change History**

This function is available since SDK API 1.24.

### mfxBRCFrameParam

**Definition**

```c
typedef struct {
    mfxU32 reserved[23];
    mfxU16 SceneChange;
    mfxU16 LongTerm;
    mfxU32 FrameCmplx;
    mfxU32 EncodedOrder;
    mfxU32 DisplayOrder;
    mfxU32 CodedFrameSize;
    mfxU16 FrameType;
    mfxU16 PyramidLayer;
    mfxU16 NumRecode;
    mfxU16 NumExtParam;
    mfxExtBuffer** ExtParam;
} mfxBRCFrameParam;
```

**Description**

Structure describes frame parameters required for external BRC functions.

**Members**

<table>
<thead>
<tr>
<th>Member</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SceneChange</td>
<td>Frame belongs to a new scene if non zero.</td>
</tr>
<tr>
<td>LongTerm</td>
<td>Frame is a Long Term Reference frame if non zero.</td>
</tr>
<tr>
<td>FrameCmplx</td>
<td>Frame spatial complexity if non zero. Zero if complexity is not available.</td>
</tr>
<tr>
<td>EncodedOrder</td>
<td>The frame number in a sequence of reordered frames starting from encoder <code>Init</code>.</td>
</tr>
<tr>
<td>DisplayOrder</td>
<td>The frame number in a sequence of frames in display order starting from last IDR.</td>
</tr>
<tr>
<td>CodedFrameSize</td>
<td>Size of the frame in bytes after encoding.</td>
</tr>
<tr>
<td>FrameType</td>
<td>See <code>FrameType</code> enumerator.</td>
</tr>
<tr>
<td>PyramidLayer</td>
<td>B-pyramid or P-pyramid layer the frame belongs to.</td>
</tr>
<tr>
<td>NumRecode</td>
<td>Number of recodings performed for this frame.</td>
</tr>
<tr>
<td>NumExtParam, ExtParam</td>
<td>Reserved for future extension.</td>
</tr>
</tbody>
</table>
**Change History**
This structure is available since SDK API 1.24.
SDK API 1.26 adds `SceneChange`, `LongTerm` and `FrameCmplx`.

### mfxBRCFrameCtrl
**Definition**
```
typedef struct {
    mfxI32 QpY;
    mfxU32 reserved1[13];
    mfxHDL reserved2;
} mfxBRCFrameCtrl;
```

**Description**
Structure specifies controls for next frame encoding provided by external BRC functions.

**Members**
- **QpY**: Frame-level Luma QP

### mfxBRCFrameStatus
**Definition**
```
typedef struct {
    mfxU32 MinFrameSize;
    mfxU16 BRCStatus;
    mfxU16 reserved[25];
    mfxHDL reserved1;
} mfxBRCFrameStatus;
```

**Description**
Structure specifies instructions for the SDK encoder provided by external BRC after each frame encoding. See the `BRCStatus` enumerator for details.

**Members**
- **MinFrameSize**: Size in bytes the coded frame must be padded to when `BRCStatus` is `MFX_BRC_PANIC_SMALL_FRAME`
- **BRCStatus**: See the `BRCStatus` enumerator

### mfxExtMultiFrameParam
**Definition**
```
typedef struct {
    mfxExtBuffer Header;
    mfxU16      MFMode;
    mfxU16      MaxNumFrames;
    mfxU16      reserved[58];
} mfxExtMultiFrameParam;
```

**Description**
Attached to the `mfxVideoParam` structure used to query supported parameters for multi frame submission operation and initialize encoder with particular values.
Multi Frame submission will gather frames from several joined sessions and combine into single submission.

**Members**
- **Header.BufferId**: Must be `MFX_EXTBUFF_MULTI_FRAME_PARAM`
- **MFMode**: Multi frame submission mode, when buffer attached, `MaxNumFrames` is not equal to zero and `MFMode` is zero - will be set to `MFX_MF_AUTO`
- **MaxNumFrames**: Maximum number of frames to be used for combining. Each encoder in joined sessions has to be initialized with the same value, depending on parameters allowed number of frames can differ, use query mechanism to identify number of frames. By default along with `MFX_MF_AUTO` will be decided by SDK, if not set with other modes - disables multi-frame operation.
**mfxExtMultiFrameControl**

**Definition**

typedef struct {
    mfxExtBuffer Header;
    mfxU32   Timeout;
    mfxU16   Flush;
    mfxU16   reserved[57];
} mfxExtMultiFrameControl;

**Description**

If application attaches this structure to the mfxEncodeCtrl structure at runtime, allow to manage timeout on per frame basis or force flushing internal frame buffer immediately.
If application attaches this structure to the mfxVideoParam structure at initialization and/or reset - set default Timeout for this stream, that will be used for all frames of current encoder session, if per-frame timeout not set.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_MULTI_FRAME_CONTROL.</td>
</tr>
<tr>
<td>Flush</td>
<td>Flushing internal frame buffer with current frame despite whether MaxNumFrames specified during initialization through mfxExtMultiFrameParam reached or not.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Time in microseconds specifying how long this encoder will wait for internal buffer of frames to collect MaxNumFrames specified during initialization through mfxExtMultiFrameParam, if elapse it'll flush internal buffer. Ignored with 'MFX_MF_MANUAL'. By default calculated based on target frame rate.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.25.

**mfxExtEncodedUnitsInfo**

**Definition**

typedef struct {
    mfxU16 Type;
    mfxU16 reserved1;
    mfxU32 Offset;
    mfxU32 Size;
    mfxU32 reserved[5];
} mfxEncodedUnitInfo;

typedef struct {
    mfxExtBuffer Header;
    union {
        mfxEncodedUnitInfo *UnitInfo;
        mfxU64 reserved1;
    }
    mfxU16 NumUnitsAlloc;
    mfxU16 NumUnitsEncoded;
    mfxU16 reserved[22];
} mfxExtEncodedUnitsInfo;

**Description**

If mfxExtCodingOption3::EncodedUnitsInfo was set to MFX_CODINGOPTION_ON during encoder initialization, structure mfxExtEncodedUnitsInfo attached to the mfxBitstream structure during encoding is used to report information about coding units in the resulting bitstream.

**Members**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Codec-dependent coding unit type (NALU type for AVC/HEVC, start_code for MPEG2 etc).</td>
</tr>
<tr>
<td>Offset</td>
<td>Offset relatively to associated mfxBitstream::DataOffset.</td>
</tr>
<tr>
<td>Size</td>
<td>Unit size including delimiter.</td>
</tr>
<tr>
<td>Header.BufferId</td>
<td>Must be MFX_EXTBUFF_ENCODED_UNITS_INFO.</td>
</tr>
<tr>
<td>UnitInfo</td>
<td>Pointer to an array of structures mfxEncodedUnitsInfo of size equal to or greater than NumUnitsAlloc.</td>
</tr>
<tr>
<td>NumUnitsAlloc</td>
<td>UnitInfo array size.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.25.
NumUnitsEncoded: Output field. Number of coding units to report. If NumUnitsEncoded is greater than NumUnitsAlloc, UnitInfo array will contain information only for the first NumUnitsAlloc units; user may consider to reallocate UnitInfo array to avoid this for consequent frames.

The number of filled items in UnitInfo is min(NumUnitsEncoded, NumUnitsAlloc).

For counting a minimal amount of encoded units you can use algorithm:

```c
nSEI = amountOfApplicationDefinedSEI;
if(CodingOption3.NumSlice[IPB] != 0 || mfxVideoParam.mfx.NumSlice != 0)
    ExpectedAmount = 10 + nSEI + Max(CodingOption3.NumSlice[IPB], mfxVideoParam.mfx.NumSlice);
else if(CodingOption2.NumMBPerSlice != 0)
    ExpectedAmount = 10 + nSEI + (FrameWidth * FrameHeight) / (256 * CodingOption2.NumMBPerSlice);
else if(CodingOption2.MaxSliceSize != 0)
    ExpectedAmount = 10 + nSEI + Round(MaxBitrate / (FrameRate*CodingOption2.MaxSliceSize));
else
    ExpectedAmount = 10 + nSEI;

if(mfxFrameInfo.PictStruct != MFX_PICSTRUCT_PROGRESSIVE)
    ExpectedAmount = ExpectedAmount * 2;
if(temporalScaleabilityEnabled)
    ExpectedAmount = ExpectedAmount * 2;
```

Encoders support: AVC

**Change History**

This structure is available since SDK API 1.25.

### mfxExtColorConversion

**Definition**

```c
typedef struct {
    mfxExtBuffer Header;
    mfxU16 ChromaSiting;
    mfxU16 reserved[27];
} mfxExtColorConversion;
```

**Description**

The mfxExtColorConversion structure is a hint structure that tunes the VPP Color Conversion algorithm, when attached to the mfxVideoParam structure during VPP Init.

**Members**

- **Header.BufferId** Must be `MFX_EXTBUFF_VPP_COLOR_CONVERSION`.
- **ChromaSiting** See ChromaSiting enumerator for details.

ChromaSiting is applied on input or output surface depending on the scenario:

<table>
<thead>
<tr>
<th>VPP Input</th>
<th>VPP Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CHROMAFORMAT_YUV420 or MFX_CHROMAFORMAT_YUV422</td>
<td>MFX_CHROMAFORMAT_YUV444</td>
<td>the ChromaSiting indicates the input chroma location.</td>
</tr>
<tr>
<td>MFX_CHROMAFORMAT_YUV444</td>
<td>MFX_CHROMAFORMAT_YUV420 or MFX_CHROMAFORMAT_YUV422</td>
<td>the ChromaSiting indicates the output chroma location.</td>
</tr>
<tr>
<td>MFX_CHROMAFORMAT_YUV420</td>
<td>MFX_CHROMAFORMAT_YUV420</td>
<td>the chroma siting location indicates chroma location for both input and output.</td>
</tr>
<tr>
<td>MFX_CHROMAFORMAT_YUV420</td>
<td>MFX_CHROMAFORMAT_YUV422</td>
<td>the chroma siting location indicates horizontal location for both input and output, and vertical location for input.</td>
</tr>
</tbody>
</table>

**Change History**

This structure is available since SDK API 1.25.

### mfxExtDecodeErrorReport

**Definition**
```c
typedef struct {
    mfxExtBuffer    Header;
    mfxU32          ErrorTypes;
    mfxU16          reserved[10];
} mfxExtDecodeErrorReport;
```

**Description**

This structure is used by the SDK decoders to report bitstream error information right after DecodeHeader or DecodeFrameAsync. The application can attach this extended buffer to the `mfxBitstream` structure at runtime.

**Members**

- **Header.BufferId**: Must be `MFX_EXTBUFF_DECODE_ERROR_REPORT`
- **ErrorTypes**: Bitstream error types (bit-ORed values). See `ErrorTypes` enumerator for the list of possible types.

**Change History**

This structure is available since SDK API 1.25.

**Enumerator Reference**

### BitstreamDataFlag

**Description**

The `BitstreamDataFlag` enumerator uses bit-ORed values to itemize additional information about the bitstream buffer.

**Name/Description**

- **MFX_BITSTREAM_COMPLETE_FRAME**: The bitstream buffer contains a complete frame or complementary field pair of data for the bitstream. For decoding, this means that the decoder can proceed with this buffer without waiting for the start of the next frame, which effectively reduces decoding latency.

  If this flag is set, but the bitstream buffer contains incomplete frame or pair of field, then decoder will produce corrupted output.

- **MFX_BITSTREAM_EOS**: The bitstream buffer contains the end of the stream. For decoding, this means that the application does not have any additional bitstream data to send to decoder.

**Change History**

This enumerator is available since SDK API 1.0. SDK API 1.6 adds `MFX_BITSTREAM_EOS` definition.

### ChromaFormatIdc

**Description**

The `ChromaFormatIdc` enumerator itemizes color-sampling formats.

**Name/Description**

- **MFX_CHROMAFORMAT_MONOCHROME**: Monochrome
- **MFX_CHROMAFORMAT_YUV420**: 4:2:0 color
- **MFX_CHROMAFORMAT_YUV422**: 4:2:2 color
- **MFX_CHROMAFORMAT_YUV444**: 4:4:4 color
- **MFX_CHROMAFORMAT_YUV400**: equal to monochrome
- **MFX_CHROMAFORMAT_YUV411**: 4:1:1 color
- **MFX_CHROMAFORMAT_YUV422H**: 4:2:2 color, horizontal subsampling. It is equal to 4:2:2 color.
- **MFX_CHROMAFORMAT_YUV422V**: 4:2:2 color, vertical subsampling

**Change History**

This enumerator is available since SDK API 1.0. SDK API 1.4 adds `MFX_CHROMAFORMAT_YUV400`, `MFX_CHROMAFORMAT_YUV411`, `MFX_CHROMAFORMAT_YUV422H` and `MFX_CHROMAFORMAT_YUV422V` definitions.

### CodecFormatFourCC

**Description**

The `CodecFormatFourCC` enumerator itemizes codecs in the FourCC format.
Name/Description

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CODEC_AVC</td>
<td>AVC, H.264, or MPEG-4, part 10 codec</td>
</tr>
<tr>
<td>MFX_CODEC_MPEG2</td>
<td>MPEG-2 codec</td>
</tr>
<tr>
<td>MFX_CODEC_VC1</td>
<td>VC-1 codec</td>
</tr>
<tr>
<td>MFX_CODEC_HEVC</td>
<td>HEVC codec</td>
</tr>
<tr>
<td>MFX_CODEC_VP9</td>
<td>VP9 codec</td>
</tr>
<tr>
<td>MFX_CODEC_AV1</td>
<td>AV1 codec</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.0.
SDK API 1.8 added MFX_CODEC_HEVC definition.
SDK API 1.19 added MFX_CODEC_VP9 definition.
SDK API 1.25 added MFX_CODEC_AV1 definition.

CodecLevel

Description

The CodecLevel enumerator itemizes codec levels for all codecs.

Name/Description

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_LEVEL_UNKNOWN</td>
<td>Unspecified codec level</td>
</tr>
<tr>
<td>MFX_LEVEL_AVC_1</td>

<tr>
<td>MFX_PROFILE_VP9_0, MFX_PROFILE_VP9_1, MFX_PROFILE_VP9_2, MFX_PROFILE_VP9_3</td>
<td>VP9 profiles</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.0.

SDK API 1.3 adds **MFX_PROFILE_AVC_EXTENDED**.

SDK API 1.4 adds **MFX_PROFILE_AVC_CONSTRAINED_BASELINE, MFX_PROFILE_AVC_CONSTRAINED_HIGH, MFX_PROFILE_AVC_PROGRESSIVE_HIGH** and six constrained flags **MFX_PROFILE_AVC_CONSTRAINT_SET**.

SDK API 1.8 added HEVC profile definitions.

SDK API 1.16 adds **MFX_PROFILE_HEVC_REXT**.
SDK API 1.19 added VP9 profile definitions.

**CodingOptionValue**

**Description**
The `CodingOptionValue` enumerator defines a three-state coding option setting.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CODINGOPTION_UNKNOWN</td>
<td>Unspecified</td>

<td>16 bits single channel color format.</td>
<td>16 bits single channel color format.</td>
</tr>
<tr>
<td></td>
<td>This format should be mapped to DXGI_FORMAT_R16_TYPELESS or D3DFMT_R16F.</td>
<td>This format should be mapped to DXGI_FORMAT_R16_TYPELESS or D3DFMT_R16F.</td>
</tr>
</tbody>
</table>
MFX_FOURCC_ABGR16  10 bits ABGR color format packed in 64 bits. ‘A’ channel is 16 MSBs, then ‘B’, then ‘G’ and then ‘R’ channels.

This format should be mapped to DXGI_FORMAT_R16G16B16A16_UINT or D3DFMT_A16B16G16R16 formats.

MFX_FOURCC_AYUV  YUV 4:4:4, AYUV color format.

This format should be mapped to DXGI_FORMAT_AYUV.

MFX_FOURCC_AYUV_RGB4  RGB4 stored in AYUV surface.

This format should be mapped to DXGI_FORMAT_AYUV.

MFX_FOURCC_UYVY  UYVY color planes. Same as YUY2 except the byte order is reversed.

MFX_FOURCC_Y210  10 bit per sample 4:2:2 packed color format with similar to YUY2 layout.

This format should be mapped to DXGI_FORMAT_Y210.

MFX_FOURCC_Y410  10 bit per sample 4:4:4 packed color format

This format should be mapped to DXGI_FORMAT_Y410.

Change History
This enumerator is available since SDK API 1.0.

The SDK API 1.1 adds MFX_FOURCC_P8.

The SDK API 1.6 adds MFX_FOURCC_P8_TEXTURE.

The SDK API 1.9 adds MFX_FOURCC_P010, MFX_FOURCC_BGR4, MFX_FOURCC_A2RGB10, MFX_FOURCC_ARGB16 and MFX_FOURCC_R16.

The SDK API 1.11 adds MFX_FOURCC_NV16 and MFX_FOURCC_P210.

The SDK API 1.17 adds MFX_FOURCC_ABRG16, MFX_FOURCC_AYUV, MFX_FOURCC_AYUV_RGB4, and MFX_FOURCC_UYVY.

The SDK API 1.27 adds MFX_FOURCC_Y210, MFX_FOURCC_Y410.

Corruption
Description
The Corruption enumerator itemizes the decoding corruption types. It is a bit-OR’ed value of the following.

Name/Description

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CORRUPTION_MINOR</td>
<td>Minor corruption in decoding certain macro-blocks.</td>
</tr>
<tr>
<td>MFX_CORRUPTION_MAJOR</td>
<td>Major corruption in decoding the frame - incomplete data, for example.</td>
</tr>
<tr>
<td>MFX_CORRUPTION_REFERENCE_FRAME</td>
<td>Decoding used a corrupted reference frame. A corrupted reference frame was used for decoding this frame. For example, if the frame uses refers to frame was decoded with minor/major corruption flag – this frame is also marked with reference corruption flag.</td>
</tr>
<tr>
<td>MFX_CORRUPTION_REFERENCE_LIST</td>
<td>The reference list information of this frame does not match what is specified in the Reference Picture Marking Repetition SEI message. (ITU-T H.264 D.1.8 dec_ref_pic_marking_repetition)</td>
</tr>
<tr>
<td>MFX_CORRUPTION_ABSENT_TOP_FIELD</td>
<td>Top field of frame is absent in bitstream. Only bottom field has been decoded.</td>
</tr>
<tr>
<td>MFX_CORRUPTION_ABSENT_BOTTOM_FIELD</td>
<td>Bottom field of frame is absent in bitstream. Only top field has been decoded.</td>
</tr>
</tbody>
</table>

Flag MFX_CORRUPTION_ABSENT_TOP_FIELD/MFX_CORRUPTION_ABSENT_BOTTOM_FIELD is set by the AVC decoder when it detects that one of fields is not present in bitstream. Which field is absent depends on value of bottom_field_flag (ITU-T H.264 7.4.3).

Change History
This enumerator is available since SDK API 1.3.

The SDK API 1.6 adds MFX_CORRUPTION_ABSENT_TOP_FIELD and MFX_CORRUPTION_ABSENT_BOTTOM_FIELD definitions.

ExtendedBufferID
Description
The ExtendedBufferID enumerator itemizes and defines identifiers (BufferId) for extended buffers or video processing algorithm identifiers.
<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_EXTBUFF_AVC_REFLIST_CTRL</td>
<td>This extended buffer defines additional encoding controls for reference list. See the mfxExtAVCRefListCtrl structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding &amp; decoding initialization, or the mfxEncodeCtrl structure for per-frame encoding configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_AVC_TEMPORAL LAYERS</td>
<td>This extended buffer configures the structure of temporal layers inside the encoded H.264 bitstream. See the mfxExtAvcTemporalLayers structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_CODING_OPTION</td>
<td>This extended buffer defines additional encoding controls. See the mfxExtCodingOption structure for details. The application can attach this buffer to the structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_CODING_OPTION2</td>
<td>This extended buffer defines additional encoding controls. See the mfxExtCodingOption2 structure for details. The application can attach this buffer to the structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_CODING_OPTION3</td>
<td>This extended buffer defines additional encoding controls. See the mfxExtCodingOption3 structure for details. The application can attach this buffer to the structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_ENCODED_FRAME_INFO</td>
<td>This extended buffer is used by the SDK encoder to report additional information about encoded picture. See the mfxExtAVCEncodedFrameInfo structure for details. The application can attach this buffer to the mfxBitstream structure before calling MFXVideoENCODER_EncodeFrameAsync function.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_ENCODER_CAPABILITY</td>
<td>This extended buffer is used to retrieve SDK encoder capability. See the mfxExtEncoderCapability structure for details. The application can attach this buffer to the mfxVideoParam structure before calling MFXVideoENCODE_Query function.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_ENCODER_RESET_OPTION</td>
<td>This extended buffer is used to control encoder reset behavior and also to query possible encoder reset outcome. See the mfxExtEncoderResetOption structure for details. The application can attach this buffer to the mfxVideoParam structure before calling MFXVideoENCODE_Query or MFXVideoENCODE_Reset functions.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_OPAQUE_SURFACE_ALLOCATION</td>
<td>This extended buffer defines opaque surface allocation information. See the mfxExtOpaqueSurfaceAlloc structure for details. The application can attach this buffer to decoding, encoding, or video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_PICTURE_TIMING_SEI</td>
<td>This extended buffer configures the H.264 picture timing SEI message. See the mfxExtPictureTimingSEI structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding initialization, or the mfxEncodeCtrl structure for per-frame encoding configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VIDEO_SIGNAL_INFO</td>
<td>This extended buffer defines video signal type. See the mfxExtVideoSignalInfo structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding initialization, and for retrieving such information from the decoders.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_AUXDATA</td>
<td>This extended buffer defines auxiliary information at the VPP output. See the mfxExtVppAuxData structure for details. The application can attach this buffer to the mfxEncodeCtrl structure for per-frame encoding control.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_DENOISE</td>
<td>The extended buffer defines control parameters for the VPP denoise filter algorithm. See the mfxExtVPPDenoise structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_DETAIL</td>
<td>The extended buffer defines control parameters for the VPP detail filter algorithm. See the mfxExtVPPDetail structure for details. The application can attach this buffer to the structure for video processing initialization.</td>
</tr>
<tr>
<td>Buffer Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_DONOTUSE</td>
<td>This extended buffer defines a list of VPP algorithms that applications should not use. See the mfxExtVPPDoNotUse structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_DOUSE</td>
<td>This extended buffer defines a list of VPP algorithms that applications should use. See the mfxExtVPPDoUse structure for details. The application can attach this buffer to the structure for video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_FRAME_RATE_CONVERSION</td>
<td>This extended buffer defines control parameters for the VPP frame rate conversion algorithm. See the mfxExtVPPFrameRateConversion structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_IMAGE_STABILIZATION</td>
<td>This extended buffer defines control parameters for the VPP image stabilization filter algorithm. See the mfxExtVPPImageStab structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_PICSTRUCT_DETECTION</td>
<td>Deprecated.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_PROCAMP</td>
<td>The extended buffer defines control parameters for the VPP ProcAmp filter algorithm. See the mfxExtVPPProcAmp structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization or to the mfxFrameData structure in the mfxFrameSurface1 structure of output surface for per-frame processing configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_SCENE_CHANGE</td>
<td>Deprecated.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_FIELD_PROCESSING</td>
<td>The extended buffer defines control parameters for the VPP field-processing algorithm. See the mfxExtVPPFieldProcessing structure for details. The application can attach this buffer to the mfxVideoParam structure for video processing initialization or to the mfxFrameData structure during runtime.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_MBQP</td>
<td>This extended buffer defines per-macroblock QP. See the mfxExtMBQP structure for details. The application can attach this buffer to the mfxEncodeCtrl structure for per-frame encoding configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_MB_FORCE_INTRA</td>
<td>This extended buffer defines per-macroblock force intra flag. See the mfxExtMBForceIntra structure for details. The application can attach this buffer to the mfxEncodeCtrl structure for per-frame encoding configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_CHROMA_LOC_INFO</td>
<td>This extended buffer defines chroma samples location information. See the mfxExtChromaLocInfo structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_HEVC_PARAM</td>
<td>See the mfxExtHEVCParam structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_HEVC_TILES</td>
<td>This extended buffer defines additional encoding controls for HEVC tiles. See the mfxExtHEVCTiles structure for details. The application can attach this buffer to the mfxVideoParam structure for encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_MB_DISABLE_SKIP_MAP</td>
<td>This extended buffer defines macroblock map for current frame which forces specified macroblocks to be non skip. See the mfxExtMBDisableSkipMap structure for details. The application can attach this buffer to the mfxEncodeCtrl structure for per-frame encoding configuration.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_DECODED_FRAME_INFO</td>
<td>This extended buffer is used by SDK decoders to report additional information about decoded frame. See the mfxExtDecodedFrameInfo structure for more details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_DECODE_ERROR_REPORT</td>
<td>This extended buffer is used by SDK decoders to report error information before frames get decoded. See the mfxExtDecodeErrorReport structure for more details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_TIME_CODE</td>
<td>See the mfxExtTimeCode structure for more details.</td>
</tr>
<tr>
<td>MFX_HEVC_REGION_SLICE</td>
<td>This extended buffer instructs HEVC encoder to encode only one region. The application can attach this buffer to the mfxVideoParam structure for HEVC encoding initialization.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_THREADS_PARAM</td>
<td>See the mfxExtThreadsParam structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_PRED_WEIGHT_TABLE</td>
<td>See the mfxExtPredWeightTable structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_AVC_ROUNDING_OFFSET</td>
<td>See the mfxExtAVCRoundingOffset structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_DIRTY_RECTANGLES</td>
<td>See the mfxExtDirtyRect structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_MOVING_RECTANGLES</td>
<td>See the mfxExtMoveRect structure for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_CODING_OPTION_VPS</td>
<td>See the mfxExtCodingOptionVPS structure for details.</td>
</tr>
</tbody>
</table>
Table 12: | ExtBuff Type | Description |
<table>
<thead>
<tr>

</tr>
<tr>
<td>MFX_EXTBUFF_TASK_DEPENDENCY</td>
<td>See the Alternative Dependencies chapter for details.</td>
</tr>
<tr>
<td>MFX_EXTBUFF_VPP_MCTF</td>
<td>This video processing algorithm identifier is used to enable MCTF via mfxExtVPPDoUse and together with mfxExtVppMctf.</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.0.

SDK API 1.6 adds MFX_EXTBUFF_VPP_IMAGE_STABILIZATION, MFX_EXTBUFF_VPP_PICSTRUCT_DETECTION, MFX_EXTBUFF_CODING_OPTION2 and deprecates MFX_EXTBUFF_VPP_SCENE_CHANGE.

SDK API 1.7 adds MFX_EXTBUFF_ENCODED_FRAME_INFO, MFX_EXTBUFF_ENCODER_CAPABILITY, MFX_EXTBUFF_ENCODER_RESET_OPTION.

SDK API 1.11 adds MFX_EXTBUFF_CODING_OPTION3 and MFX_EXTBUFF_VPP_FIELD_PROCESSING.

SDK API 1.13 adds MFX_EXTBUFF_MBQP, MFX_EXTBUFF_HEVC_TILES, MFX_EXTBUFF_MB_DISABLE_SKIP_MAP and MFX_EXTBUFF_CHROMA_LOC_INFO.

SDK API 1.14 adds MFX_EXTBUFF_HEVC_PARAM, MFX_EXTBUFF_HEVC_TILES, MFX_EXTBUFF_MB_DISABLE_SKIP_MAP, MFX_EXTBUFF_DECODED_FRAME_INFO and MFX_EXTBUFF_TIME_CODE.

SDK API 1.15 adds MFX_HEVC_REGION_SLICE and MFX_EXTBUFF_THREADS_PARAM.

SDK API 1.16 adds MFX_EXTBUFF_PRED_WEIGHT_TABLE, MFX_EXTBUFF_DIRTY_RECTANGLES and MFX_EXTBUFF_MOVING_RECTANGLES.

SDK API 1.17 adds MFX_EXTBUFF_CODING_OPTION_VPS and MFX_EXTBUFF_VPP_ROTATION and deprecates MFX_EXTBUFF_VPP_PICSTRUCT_DETECTION.

SDK API 1.19 adds MFX_EXTBUFF_ENCODED_SLICES_INFO, MFX_EXTBUFF_MV_OVER_PIC_BOUNDARIES, MFX_EXTBUFF_VPP_SCALING, MFX_EXTBUFF_VPP_MIRRORING, MFX_EXTBUFF_VPP_COLORFILL.

SDK API 1.22 adds MFX_EXTBUFF_DEC_VIDEO_PROCESSING.

SDK API 1.23 adds MFX_EXTBUFF_MB_FORCE_INTRA.

SDK API 1.24 adds MFX_EXTBUFF_BRC.

SDK API 1.25 adds MFX_EXTBUFF_CONTENT_LIGHT_LEVEL_INFO, MFX_EXTBUFF_MASTERING_DISPLAY_COLOUR_VOLUME, MFX_EXTBUFF_MULTI_FRAME_PARAM, MFX_EXTBUFF_MULTI_FRAME_CONTROL, MFX_EXTBUFF_ENCODED_UNITS_INFO and MFX_EXTBUFF_DECODE_ERROR_REPORT.

SDK API 1.26 adds MFX_EXTBUFF_VP9_PARAM, MFX_EXTBUFF_VP9_SEGMENTATION, MFX_EXTBUFF_VP9_TEMPORAL_LAYERS, MFX_EXTBUFF_VPP_MCTF.

SDK API 1.27 adds MFX_EXTBUFF_AVC_BOUNDING_OFFSET.
See additional change history in the structure definitions.

### ExtMemBufferType

**Description**
The `ExtMemBufferType` enumerator specifies the buffer type. It is a bit-ORed value of the following.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_MEMTYPE_PERSISTENT_MEMORY</td>
<td>Memory page for persistent use</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.0.

### ExtMemFrameType

**Description**
The `ExtMemFrameType` enumerator specifies the memory type of frame. It is a bit-ORed value of the following. For information on working with video memory surfaces, see the section Working with hardware acceleration.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_MEMTYPE_VIDEO_MEMORY_DECODER_TARGET</td>
<td>Frames are in video memory and belong to video decoder render targets.</td>
</tr>
<tr>
<td>MFX_MEMTYPE_VIDEO_MEMORY_PROCESSOR_TARGET</td>
<td>Frames are in video memory and belong to video processor render targets.</td>
</tr>
<tr>
<td>MFX_MEMTYPE_SYSTEM_MEMORY</td>
<td>The frames are in system memory.</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_ENCODE</td>
<td>Allocation request comes from an <code>ENCODE</code> function</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_DECODE</td>
<td>Allocation request comes from a <code>DECODE</code> function</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_VPPIN</td>
<td>Allocation request comes from a <code>VPP</code> function for input frame allocation</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_VPPOUT</td>
<td>Allocation request comes from a <code>VPP</code> function for output frame allocation</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_ENC</td>
<td>Allocation request comes from an <code>ENC</code> function</td>
</tr>
<tr>
<td>MFX_MEMTYPE_FROM_FAK</td>
<td>Reserved</td>
</tr>
<tr>
<td>MFX_MEMTYPE_INTERNAL_FRAME</td>
<td>Allocation request for internal frames</td>
</tr>
<tr>
<td>MFX_MEMTYPE_EXTERNAL_FRAME</td>
<td>Allocation request for I/O frames</td>
</tr>
<tr>
<td>MFX_MEMTYPE_OPAQUE_FRAME</td>
<td>Allocation request for opaque frames</td>
</tr>
<tr>
<td>MFX_MEMTYPE_EXPORT_FRAME</td>
<td>Application requests frame handle export to some associated object. For Linux frame handle can be considered to be exported to DRM Prime FD, DRM FLink or DRM FrameBuffer Handle. Specifics of export types and export procedure depends on external frame allocator implementation</td>
</tr>
<tr>
<td>MFX_MEMTYPE_SHARED_RESOURCE</td>
<td>For DX11 allocation use shared resource bind flag.</td>
</tr>
</tbody>
</table>

**Remarks**

The application may use macro `MFX_MEMTYPE_BASE` to extract the base memory types, one of `MFX_MEMTYPE_VIDEO_MEMORY_DECODER_TARGET`, `MFX_MEMTYPE_VIDEO_MEMORY_PROCESSOR_TARGET`, and `MFX_MEMTYPE_SYSTEM_MEMORY`.

**Change History**

This enumerator is available since SDK API 1.0.

SDK API 1.3 extended the `MFX_MEMTYPE_OPAQUE_FRAME` definition and the `MFX_MEMTYPE_BASE` macro definition.

SDK API 1.17 adds `MFX_MEMTYPE_EXPORT_FRAME`.

SDK API 1.19 adds `MFX_MEMTYPE_SHARED_RESOURCE`.

### FrameDataFlag

**Description**
The `FrameDataFlag` enumerator uses bit-ORed values to itemize additional information about the frame buffer.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_FRAMEDATA_ORIGINAL_TIMESTAMP</td>
<td>Indicates the time stamp of this frame is not calculated and is a pass-through of the original time stamp.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.3.

**FrameType**

**Description**
The FrameType enumerator itemizes frame types. Use bit-ORed values to specify all that apply.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_FRAMETYPE_I</td>
<td>This frame or the first field is encoded as an I frame/field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_P</td>
<td>This frame or the first field is encoded as a P frame/field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_B</td>
<td>This frame or the first field is encoded as a B frame/field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_S</td>
<td>This frame or the first field is either an SI- or SP-frame/field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_REF</td>
<td>This frame or the first field is encoded as a reference.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_IDR</td>
<td>This frame or the first field is encoded as an IDR.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xI</td>
<td>The second field is encoded as an I-field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xP</td>
<td>The second field is encoded as a P-field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xB</td>
<td>The second field is encoded as a B-field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xS</td>
<td>The second field is an SI- or SP-field.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xREF</td>
<td>The second field is encoded as a reference.</td>
</tr>
<tr>
<td>MFX_FRAMETYPE_xIDR</td>
<td>The second field is encoded as an IDR.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.0. SDK API 1.3 extended the second field types.

**MfxNalUnitType**

**Description**
This enumerator specifies NAL unit types supported by the SDK HEVC encoder.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_HEVC_NALU_TYPE_UNKNOWN</td>
<td>The SDK encoder will decide what NAL unit type to use.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_TRAIL_N</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_TRAIL_R</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_RADL_N</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_RADL_R</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_RASL_N</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_RASL_R</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_IDR_W_RADL</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_IDR_N_LP</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
<tr>
<td>MFX_HEVC_NALU_TYPE_CRA_NUT</td>
<td>See Table 7-1 of the ITU-T H.265 specification for the definition of these types.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.25.

**FrcAlgm**

**Description**
The FrcAlgm enumerator itemizes frame rate conversion algorithms. See description of mfxExtVPPFrameRateConversion structure for more details.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_FRCALGM_PRESERVE_TIMESTAMP</td>
<td>Frame dropping/repetition based frame rate conversion algorithm with preserved original time stamps. Any inserted frames will carry MFX_TIMESTAMP_UNKNOWN.</td>
</tr>
<tr>
<td>MFX_FRCALGM_DISTRIBUTED_TIMESTAMP</td>
<td>Frame dropping/repetition based frame rate conversion algorithm with distributed time stamps. The algorithm distributes output time stamps evenly according to the output frame rate.</td>
</tr>
<tr>
<td>MFX_FRCALGM_FRAME_INTERPOLATION</td>
<td>Frame rate conversion algorithm based on frame interpolation. This flag may be combined with MFX_FRCALGM_PRESERVE_TIMESTAMP or MFX_FRCALGM_DISTRIBUTED_TIMESTAMP flags.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.3.

**GopOptFlag**
Description

The **GopOptFlag** enumerator itemizes special properties in the GOP (Group of Pictures) sequence.

### Name/Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_GOP_CLOSED</td>
<td>The encoder generates closed GOP if this flag is set. Frames in this GOP do not use frames in previous GOP as reference.</td>
</tr>
<tr>
<td></td>
<td>The encoder generates open GOP if this flag is not set. In this GOP frames prior to the first frame of GOP in display order may use frames from previous GOP as reference. Frames subsequent to the first frame of GOP in display order do not use frames from previous GOP as reference.</td>
</tr>
<tr>
<td></td>
<td>The AVC encoder ignores this flag if <strong>IdrInterval</strong> in <strong>mfxInfoMFX</strong> structure is set to 0, i.e. if every GOP starts from IDR frame. In this case, GOP is encoded as closed.</td>
</tr>
<tr>
<td></td>
<td>This flag does not affect long-term reference frames. See Appendix C: <a href="#">Long-term Reference frame</a> for more details.</td>
</tr>
<tr>
<td>MFX_GOP_STRICT</td>
<td>The encoder must strictly follow the given GOP structure as defined by parameter <strong>GopPicSize</strong>, <strong>GopRefDist</strong> etc in the <strong>mfxVideoParam</strong> structure. Otherwise, the encoder can adapt the GOP structure for better efficiency, whose range is constrained by parameter <strong>GopPicSize</strong> and <strong>GopRefDist</strong> etc. See also description of AdaptiveI and AdaptiveB fields in the <strong>mfxExtCodingOption2</strong> structure.</td>
</tr>
</tbody>
</table>

### Change History

This enumerator is available since SDK API 1.0.

### IOPattern

Description

The **IOPattern** enumerator itemizes memory access patterns for SDK functions. Use bit-ORed values to specify an input access pattern and an output access pattern.

### Name/Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_IOPATTERN_IN_VIDEO_MEMORY</td>
<td>Input to SDK functions is a video memory surface</td>
</tr>
<tr>
<td>MFX_IOPATTERN_IN_SYSTEM_MEMORY</td>
<td>Input to SDK functions is a linear buffer directly in system memory or in system memory through an external allocator</td>
</tr>
<tr>
<td>MFX_IOPATTERN_IN_OPAQUE_MEMORY</td>
<td>Input to SDK functions maps at runtime to either a system memory buffer or a video memory surface.</td>
</tr>
<tr>
<td>MFX_IOPATTERN_OUT_VIDEO_MEMORY</td>
<td>Output to SDK functions is a video memory surface</td>
</tr>
<tr>
<td>MFX_IOPATTERN_OUT_SYSTEM_MEMORY</td>
<td>Output to SDK functions is a linear buffer directly in system memory or in system memory through an external allocator</td>
</tr>
<tr>
<td>MFX_IOPATTERN_OUT_OPAQUE_MEMORY</td>
<td>Output to SDK functions maps at runtime to either a system memory buffer or a video memory surface.</td>
</tr>
</tbody>
</table>

### Change History

This enumerator is available since SDK API 1.0. SDK API 1.3 extended the **MFX_IOPATTERN_IN_OPAQUE_MEMORY** and **MFX_IOPATTERN_OUT_OPAQUE_MEMORY** definitions.

### mfxHandleType

Description

The **mfxHandleType** enumerator itemizes system handle types that SDK implementations might use.

### Name/Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_HANDLE_D3D9_DEVICE_MANAGER</td>
<td>Pointer to the <strong>IDirect3DDeviceManager9</strong> interface. See Working with Microsoft* DirectX* Applications for more details on how to use this handle.</td>
</tr>
<tr>
<td>MFX_HANDLE_D3D11_DEVICE</td>
<td>Pointer to the <strong>ID3D11Device</strong> interface. See Working with Microsoft* DirectX* Applications for more details on how to use this handle.</td>
</tr>
<tr>
<td>MFX_HANDLE_VA DISPLAY</td>
<td>Pointer to VADisplay interface. See Working with VA API Applications for more details on how to use this handle.</td>
</tr>
<tr>
<td>MFX_HANDLE_ENCODE_CONTEXT</td>
<td>Pointer to VAContextID interface. It represents encoder context.</td>
</tr>
</tbody>
</table>

### Change History

This enumerator is available since SDK API 1.0.

SDK API 1.4 added **MFX_HANDLE_D3D11_DEVICE** definition.

SDK API 1.8 added **MFX_HANDLE_VA_DISPLAY** and **MFX_HANDLE_ENCODE_CONTEXT** definitions.
**mfxIMPL**

**Description**
The `mfxIMPL` enumerator itemizes SDK implementation types. The implementation type is a bit OR’ed value of the base type and any decorative flags.

**Name/Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_IMPL_AUTO</td>
<td>Find the best SDK implementation automatically. It includes either hardware-accelerated implementation on the default acceleration device or software implementation. This value is obsolete and it is recommended to use MFX_IMPL_AUTO_ANY instead.</td>
</tr>
<tr>
<td>MFX_IMPL_SOFTWARE</td>
<td>Use the software implementation</td>
</tr>
<tr>
<td>MFX_IMPL_HARDWARE</td>
<td>Use the hardware-accelerated implementation on the default acceleration device</td>
</tr>
<tr>
<td>MFX_IMPL_RUNTIME</td>
<td>This value cannot be used for session initialization. It may be returned by MFXQueryIMPL function to show that session has been initialized in run time mode.</td>
</tr>
<tr>
<td>MFX_IMPL_UNSUPPORTED</td>
<td>Failed to locate the desired SDK implementation</td>
</tr>
</tbody>
</table>

If the acceleration device is not default device, use the following values to initialize the SDK libraries on an alternative acceleration device.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_IMPL_AUTO_ANY</td>
<td>Find the SDK implementation on any acceleration device including the default acceleration device and the SDK software library.</td>
</tr>
<tr>
<td>MFX_IMPL_HARDWARE_ANY</td>
<td>Find the hardware-accelerated implementation on any acceleration device including the default acceleration device.</td>
</tr>
<tr>
<td>MFX_IMPL_HARDWARE2</td>
<td>Use the hardware-accelerated implementation on the second acceleration device.</td>
</tr>
<tr>
<td>MFX_IMPL_HARDWARE3</td>
<td>Use the hardware-accelerated implementation on the third acceleration device.</td>
</tr>
<tr>
<td>MFX_IMPL_HARDWARE4</td>
<td>Use the hardware-accelerated implementation on the fourth acceleration device.</td>
</tr>
</tbody>
</table>

Use the following decorative flags to specify the OS infrastructure that hardware acceleration should base on.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_IMPL_VIA_D3D9</td>
<td>Hardware acceleration goes through the Microsoft* Direct3D9* infrastructure.</td>
</tr>
<tr>
<td>MFX_IMPL_VIA_D3D11</td>
<td>Hardware acceleration goes through the Microsoft* Direct3D11* infrastructure.</td>
</tr>
<tr>
<td>MFX_IMPL_VIA_VAAPI</td>
<td>Hardware acceleration goes through the Linux* VA API infrastructure.</td>
</tr>
<tr>
<td>MFX_IMPL_VIA_ANY</td>
<td>Hardware acceleration can go through any supported OS infrastructure. This is default value, it is used by the SDK if none of MFX_IMPL_VIA_xxx flag is specified by application.</td>
</tr>
<tr>
<td>MFX_IMPL_AUDIO</td>
<td>Load audio library. It can be used only together with MFX_IMPL_SOFTWARE, any other combinations lead to error.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.0.

SDK API 1.1 added support of multiple devices.

SDK API 1.3 added support of OS infrastructure definitions.

SDK API 1.6 changed defaults OS infrastructure from MFX_IMPL_VIA_D3D9 to MFX_IMPL_VIA_ANY.

SDK API 1.8 added support of MFX_IMPL_AUDIO and MFX_IMPL_VIA_VAAPI.

**Remarks**
The application can use the macro `MFX_IMPL_BASETYPE(x)` to obtain the base implementation type.

It is recommended that the application use MFX_IMPL_VIA_ANY if the application uses system memory or opaque surface for I/O exclusively.

**mfxPriority**

**Description**
The `mfxPriority` enumerator describes the session priority.

**Name/Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PRIORITY_LOW</td>
<td>Low priority: the session operation halts when high priority tasks are executing and more than 75% of the CPU is being used for normal priority tasks.</td>
</tr>
<tr>
<td>MFX_PRIORITY_NORMAL</td>
<td>Normal priority: the session operation is halted if there are high priority tasks.</td>
</tr>
<tr>
<td>MFX_PRIORITY_HIGH</td>
<td>High priority: the session operation blocks other lower priority session operations.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.1.

**mfxSkipMode**
Description

The `mfxSkipMode` enumerator describes the decoder skip-mode options.

Name/Description

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_SKIPMODE_NONE</td>
<td>Do not skip any frames.</td>
</tr>
<tr>
<td>MFX_SKIPMODE_MORE</td>
<td>Skip more frames.</td>
</tr>
<tr>
<td>MFX_SKIPMODE_LESS</td>
<td>Skip less frames.</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.0.

mfxStatus

Description

The `mfxStatus` enumerator itemizes status codes returned by SDK functions.

When an SDK function returns an error status code, it generally expects a `Reset` or `Close` function to follow, (with the exception of `MFX_ERR_MORE_DATA` and `MFX_ERR_MORE_SURFACE` for asynchronous operation considerations) See section Decoding Procedures, section Encoding Procedures, and section Video Processing Procedures for more information about recovery procedures.

When an SDK function returns a warning status code, the function has performed necessary operations to continue the operation without interruption. In this case, the output might be unreliable. The application must check the validity of the output generated by the function.

Name/Description

Successful operation

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NONE</td>
<td>No error</td>
</tr>
</tbody>
</table>

Reserved status code

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_UNKNOWN</td>
<td>An unknown error occurred in the library function operation. This is a reserved status code.</td>
</tr>
</tbody>
</table>

Programming related errors

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_NOT_INITIALIZED</td>
<td>Member functions called without initialization.</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_HANDLE</td>
<td>Invalid session or MemId handle</td>
</tr>
<tr>
<td>MFX_ERR_NULL_PTR</td>
<td>NULL pointer in the input or output arguments</td>
</tr>
<tr>
<td>MFX_ERR_UNDEFINED_BEHAVIOR</td>
<td>The behavior is undefined.</td>
</tr>
<tr>
<td>MFX_ERR_NOT_ENOUGH_BUFFER</td>
<td>Insufficient buffer for input or output.</td>
</tr>
<tr>
<td>MFX_ERR_NOT_FOUND</td>
<td>Specified object/item/sync point not found.</td>
</tr>
</tbody>
</table>

Memory related errors

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_MEMORY_ALLOC</td>
<td>Failed to allocate memory.</td>
</tr>
<tr>
<td>MFX_ERR_LOCK_MEMORY</td>
<td>Failed to lock the memory block (external allocator).</td>
</tr>
<tr>
<td>MFX_ERR_REALLOC_SURFACE</td>
<td>Bigger output surface required.</td>
</tr>
</tbody>
</table>

Configuration related errors or warnings

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_UNSUPPORTED</td>
<td>Unsupported configurations, parameters, or features</td>
</tr>
<tr>
<td>MFX_ERR_INVALID_VIDEO_PARAM</td>
<td>Invalid video parameters detected. <code>Init</code> and <code>Reset</code> functions return this status code to indicate either that mandated input parameters are unspecified, or the functions failed to correct them.</td>
</tr>
<tr>
<td>MFX_ERR_INCOMPATIBLE_VIDEO_PARAM</td>
<td>Incompatible video parameters detected. If a <code>Reset</code> function returns this status code, a component—decoder, encoder or video preprocessor—cannot process the specified configuration with existing structures and frame buffers. If the function <code>MFXVideoDECODE_DecodeFrameAsync</code> returns this status code, the bitstream contains an incompatible video parameter configuration that the decoder cannot follow.</td>
</tr>
<tr>
<td>MFX_WRN_VIDEO_PARAM_CHANGED</td>
<td>The decoder detected a new sequence header in the bitstream. Video parameters may have changed.</td>
</tr>
<tr>
<td>MFX_WRN_VALUE_NOT_CHANGED</td>
<td>The parameter has been clipped to its value range.</td>
</tr>
<tr>
<td>MFX_WRN_OUT_OF_RANGE</td>
<td>The parameter is out of valid value range.</td>
</tr>
<tr>
<td>MFX_WRN_INCOMPATIBLE_VIDEO_PARAM</td>
<td>Incompatible video parameters detected. SDK functions return this status code to indicate that there was incompatibility in the specified parameters and has resolved it.</td>
</tr>
<tr>
<td>MFX_WRN_FILTER_SKIPPED</td>
<td>The SDK VPP has skipped one or more optional filters requested by the application. To retrieve actual list of filters attach <code>mfxExtVPPDoUse</code> to <code>mfxVideoParam</code> and call <code>MFXVideoVPP_GetVideoParam</code>. The application must ensure that enough memory is allocated for filter list.</td>
</tr>
</tbody>
</table>
Asynchronous operation related errors or warnings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_ABORTED</td>
<td>The asynchronous operation aborted.</td>
</tr>
<tr>
<td>MFX_ERR_MORE_DATA</td>
<td>Need more bitstream at decoding input, encoding input, or video processing input frames.</td>
</tr>
<tr>
<td>MFX_ERR_MORE_SURFACE</td>
<td>Need more frame surfaces at decoding or video processing output</td>
</tr>
<tr>
<td>MFX_ERR_MORE_BITSTREAM</td>
<td>Need more bitstream buffers at the encoding output</td>
</tr>
<tr>
<td>MFX_WRN_IN_EXECUTION</td>
<td>Synchronous operation still running</td>
</tr>
</tbody>
</table>

Hardware device related errors or warnings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERR_DEVICE_FAILED</td>
<td>Hardware device returned unexpected errors. SDK was unable to restore operation. See section Hardware Device Error Handling for more information.</td>
</tr>
<tr>
<td>MFX_ERR_DEVICE_LOST</td>
<td>Hardware device was lost; See the Hardware Device Error Handling section for further information.</td>
</tr>
<tr>
<td>MFX_WRN_DEVICE_BUSY</td>
<td>Hardware device is currently busy. Call this function again in a few milliseconds.</td>
</tr>
<tr>
<td>MFX_WRN_PARTIAL_ACCELERATION</td>
<td>The hardware does not support the specified configuration. Encoding, decoding, or video processing may be partially accelerated. Only SDK HW implementation may return this status code.</td>
</tr>
<tr>
<td>MFX_ERR_GPU_HANG</td>
<td>Hardware device operation failure caused by GPU hang.</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.0.

SDK API 1.3 added the MFX_ERR_MORE_BITSTREAM return status.

SDK API 1.6 added the MFX_WRN_FILTER_SKIPPED return status.

SDK API 1.19 added MFX_ERR_GPU_HANG and MFX_ERR_REALLOC_SURFACE.

PicStruct

Description

The PicStruct enumerator itemizes picture structure. Use bit-OR’ed values to specify the desired picture type.

Name/Description

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PICSTRUCT_UNKNOWN</td>
<td>Unspecified or mixed progressive/interlaced/field pictures</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>Progressive picture</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_TFF</td>
<td>Top field in first interlaced picture</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_BFF</td>
<td>Bottom field in first interlaced picture</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_REPEATED</td>
<td>First field repeated: pic_struct = 5 or 6 in H.264</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FRAME.DOUBLING</td>
<td>Double the frame for display: pic_struct = 7 in H.264</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FRAME.3PLING</td>
<td>Triple the frame for display: pic_struct = 8 in H.264</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD.SINGLE</td>
<td>Single field in a picture</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD.TOP</td>
<td>Top field in a picture: pic_struct = 1 in H.265</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD.BOTTOM</td>
<td>Bottom field in a picture: pic_struct = 2 in H.265</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD.PAIREDPREV</td>
<td>Paired with previous field: pic_struct = 9 or 10 in H.265</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD.PAIREDNEXT</td>
<td>Paired with next field: pic_struct = 11 or 12 in H.265</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.0. SDK API 1.3 added support of combined display attributes. SDK API 1.20 added support of single fields.

Remarks

It is possible to combine the above picture structure values to indicate additional display attributes. If ExtendedPicStruct in the mfxInfoMFX structure is true, DECODE outputs extended picture structure values to indicate how to display an output frame as shown in the following table:

<table>
<thead>
<tr>
<th>Extended PicStruct Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>MFX_PICSTRUCT_FRAME_DOUBLING</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>MFX_PICSTRUCT_FRAME_TRIPLING</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>MFX_PICSTRUCT_FIELD_TFF</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>MFX_PICSTRUCT_FIELD_BFF</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_PROGRESSIVE</td>
<td>MFX_PICSTRUCT_FIELD_REPEATED</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_TOP</td>
<td>MFX_PICSTRUCT_FIELD_BFF</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_TOP</td>
<td>MFX_PICSTRUCT_FIELD_PAIRED_PREV</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_Bottom</td>
<td>MFX_PICSTRUCT_FIELD_PAIRED_PREV</td>
</tr>
<tr>
<td>MFX_PICSTRUCT_FIELD_Bottom</td>
<td>MFX_PICSTRUCT_FIELD_PAIRED_NEXT</td>
</tr>
</tbody>
</table>

In the above cases, VPP processes the frame as a progressive frame and passes the extended picture structure values from input to output. **ENCODE** encodes the frame as a progressive frame and marks the bitstream header properly according to the extended picture structure values.

**RateControlMethod**

**Description**

The **RateControlMethod** enumerator itemizes bitrate control methods.

**Name/Description**

<table>
<thead>
<tr>
<th>MFX_RATECONTROL_CBR</th>
<th>Use the constant bitrate control algorithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_RATECONTROL_VBR</td>
<td>Use the variable bitrate control algorithm</td>
</tr>
<tr>
<td>MFX_RATECONTROL_CQP</td>
<td>Use the constant quantization parameter algorithm.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_AVBR</td>
<td>Use the average variable bitrate control algorithm</td>
</tr>
<tr>
<td>MFX_RATECONTROL_LA</td>
<td>Use the VBR algorithm with look ahead. It is a special bitrate control mode in the SDK AVC encoder that has been designed to improve encoding quality. It works by performing extensive analysis of several dozen frames before the actual encoding and as a side effect significantly increases encoding delay and memory consumption.</td>
</tr>
<tr>
<td></td>
<td>The only available rate control parameter in this mode is <code>mfxInfoMFX::TargetKbps</code>. Two other parameters, MaxKbps and InitialDelayInKB, are ignored. To control LA depth the application can use <code>mfxExtCodingOption2::LookAheadDepth</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>This method is not HRD compliant.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_ICQ</td>
<td>Use the Intelligent Constant Quality algorithm. This algorithm improves subjective video quality of encoded stream. Depending on content, it may or may not decrease objective video quality. Only one control parameter is used - quality factor, specified by <code>mfxInfoMFX::ICQQuality</code>.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_VCM</td>
<td>Use the Video Conferencing Mode algorithm. This algorithm is similar to the VBR and uses the same set of parameters <code>mfxInfoMFX::InitialDelayInKB</code>, <code>TargetKbps</code> and <code>MaxKbps</code>. It is tuned for IPPP GOP pattern and streams with strong temporal correlation between frames. It produces better objective and subjective video quality in these conditions than other bitrate control algorithms. It does not support interlaced content, B frames and produced stream is not HRD compliant.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_LA_ICQ</td>
<td>Use intelligent constant quality algorithm with look ahead. Quality factor is specified by <code>mfxInfoMFX::ICQQuality</code>. To control LA depth the application can use <code>mfxExtCodingOption2::LookAheadDepth</code> parameter.</td>
</tr>
<tr>
<td></td>
<td>This method is not HRD compliant.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_LA_EXT</td>
<td>Use extended look ahead rate control algorithm. It is intended for one to N transcode scenario and requires presence of <code>mfxExtLAFrameStatistics</code> structure at encoder input at runtime. Rate control is supported by AVC and HEVC encoders.</td>
</tr>
<tr>
<td>MFX_RATECONTROL_LA_HRD</td>
<td>Use HRD compliant look ahead rate control algorithm.</td>
</tr>
</tbody>
</table>
Use the variable bitrate control algorithm with constant quality. This algorithm trying to achieve the target subjective quality with the minimum number of bits, while the bitrate constraint and HRD compliancy are satisfied. It uses the same set of parameters as VBR and quality factor specified by \texttt{mfxExtCodingOption3::QVBRQuality}.

**Change History**
This enumerator is available since SDK API 1.0.
The SDK API 1.1 added the constant quantization parameter algorithm.
The SDK API 1.3 added the average variable bitrate control algorithm.
The SDK API 1.7 added the look ahead algorithm.
The SDK API 1.8 added the intelligent constant quality and video conferencing mode algorithms.
The SDK API 1.10 added the extended look ahead rate control algorithm.
The SDK API 1.11 added the HRD compliant look ahead and variable bitrate with constant quality rate control algorithms.

**TimeStampCalc**
**Description**
The \texttt{TimeStampCalc} enumerator itemizes time-stamp calculation methods.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{MFX_TIMESTAMPCALC_UNKNOWN}</td>
</tr>
<tr>
<td>\texttt{MFX_TIMESTAMPCALC_TELECINE}</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.3.

**TargetUsage**
**Description**
The \texttt{TargetUsage} enumerator itemizes a range of numbers from \texttt{MFX_TARGETUSAGE_1}, best quality, to \texttt{MFX_TARGETUSAGE_7}, best speed. It indicates trade-offs between quality and speed. The application can use any number in the range. The actual number of supported target usages depends on implementation. If specified target usage is not supported, the SDK encoder will use the closest supported value.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{MFX_TARGETUSAGE_1}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_2}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_3}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_4}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_5}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_6}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_7}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_UNKNOWN}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_BEST_QUALITY}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_BALANCED}</td>
</tr>
<tr>
<td>\texttt{MFX_TARGETUSAGE_BEST_SPEED}</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.0.
The SDK API 1.7 adds \texttt{MFX_TARGETUSAGE_1} .. \texttt{MFX_TARGETUSAGE_7} values.

**TrellisControl**
**Description**
The \texttt{TrellisControl} enumerator is used to control trellis quantization in AVC encoder. The application can turn it on or off for any combination of I, P and B frames by combining different enumerator values. For example, \texttt{MFX_TRELLIS_I | MFX_TRELLIS_B} turns it on for I and B frames.
Due to performance reason on some target usages trellis quantization is always turned off and this control is ignored by the SDK encoder.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_TRELLIS_UNKNOWN</td>
<td>Default value, it is up to the SDK encoder to turn trellis quantization on or off.</td>
</tr>
<tr>
<td>MFX_TRELLIS_OFF</td>
<td>Turn trellis quantization off for all frame types.</td>
</tr>
<tr>
<td>MFX_TRELLIS_I</td>
<td>Turn trellis quantization on for I frames.</td>
</tr>
<tr>
<td>MFX_TRELLIS_P</td>
<td>Turn trellis quantization on for P frames.</td>
</tr>
<tr>
<td>MFX_TRELLIS_B</td>
<td>Turn trellis quantization on for B frames.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.7.

**BRefControl**

**Description**

The BRefControl enumerator is used to control usage of B frames as reference in AVC encoder.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_B_REF_UNKNOWN</td>
<td>Default value, it is up to the SDK encoder to use B frames as reference.</td>
</tr>
<tr>
<td>MFX_B_REF_OFF</td>
<td>Do not use B frames as reference.</td>
</tr>
<tr>
<td>MFX_B_REF_PYRAMID</td>
<td>Arrange B frames in so-called &quot;B pyramid&quot; reference structure.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.8.

**LookAheadDownSampling**

**Description**

The LookAheadDownSampling enumerator is used to control down sampling in look ahead bitrate control mode in AVC encoder.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_LOOKAHEAD_DS_UNKNOWN</td>
<td>Default value, it is up to the SDK encoder what down sampling value to use.</td>
</tr>
<tr>
<td>MFX_LOOKAHEAD_DS_OFF</td>
<td>Do not use down sampling, perform estimation on original size frames. This is the slowest setting that produces the best quality.</td>
</tr>
<tr>
<td>MFX_LOOKAHEAD_DS_2x</td>
<td>Down sample frames two times before estimation.</td>
</tr>
<tr>
<td>MFX_LOOKAHEAD_DS_4x</td>
<td>Down sample frames four times before estimation. This option may significantly degrade quality.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.8.

**VPPFieldProcessingMode**

**Description**

The VPPFieldProcessingMode enumerator is used to control VPP field processing algorithm.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_VPP_COPY_FRAME</td>
<td>Copy the whole frame.</td>
</tr>
<tr>
<td>MFX_VPP_COPY_FIELD</td>
<td>Copy only one field.</td>
</tr>
<tr>
<td>MFX_VPP_SWAP_FIELDS</td>
<td>Swap top and bottom fields.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.11.

**PicType**

**Description**

The PicType enumerator itemizes picture type.

**Name/Description**

<table>
<thead>
<tr>
<th>Enumerators</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PICTYPE_UNKNOWN</td>
<td>Picture type is unknown.</td>
</tr>
<tr>
<td>MFX_PICTYPE_FRAME</td>
<td>Picture is a frame.</td>
</tr>
<tr>
<td>MFX_PICTYPE_TOPFIELD</td>
<td>Picture is a top field.</td>
</tr>
</tbody>
</table>
SkipFrame

Description

The **SkipFrame** enumerator is used to define usage of `mfxEncodeCtrl::SkipFrame` parameter.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_SKIPFRAME_NO_SKIP</td>
<td>Frame skipping is disabled, <code>mfxEncodeCtrl::SkipFrame</code> is ignored.</td>
</tr>
<tr>
<td>MFX_SKIPFRAME_INSERT_DUMMY</td>
<td>Skipping is allowed, when <code>mfxEncodeCtrl::SkipFrame</code> is set encoder inserts into bitstream frame where all macroblocks are encoded as skipped. Only non-reference P and B frames can be skipped. If GopRefDist = 1 and <code>mfxEncodeCtrl::SkipFrame</code> is set for reference P frame, it will be encoded as non-reference.</td>
</tr>
<tr>
<td>MFX_SKIPFRAME_INSERT NOTHING</td>
<td>Similar to MFX_SKIPFRAME_INSERT_DUMMY, but when <code>mfxEncodeCtrl::SkipFrame</code> is set encoder inserts nothing into bitstream.</td>
</tr>
<tr>
<td>MFX_SKIPFRAME_BRC_ONLY</td>
<td><code>mfxEncodeCtrl::SkipFrame</code> indicates number of missed frames before the current frame. Affects only BRC, current frame will be encoded as usual.</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.11.

The SDK API 1.13 adds **MFX_SKIPFRAME_BRC_ONLY**.

DeinterlacingMode

Description

The **DeinterlacingMode** enumerator itemizes VPP deinterlacing modes.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_DEINTERLACING_BOB</td>
<td>BOB deinterlacing mode.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_ADVANCED</td>
<td>Advanced deinterlacing mode.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_AUTO_DOUBLE</td>
<td>Auto mode with deinterlacing double framerate output.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_AUTO_SINGLE</td>
<td>Auto mode with deinterlacing single framerate output.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_FULL_FR_OUT</td>
<td>Deinterlace only mode with full framerate output.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_HALF_FR_OUT</td>
<td>Deinterlace only Mode with half framerate output.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_24FPS_OUT</td>
<td>24 fps fixed output mode.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_FIXED_TELECINE_PATTERN</td>
<td>Fixed telecine pattern removal mode.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_30FPS_OUT</td>
<td>30 fps fixed output mode.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_DETECT_INTERLACE</td>
<td>Only interlace detection.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_ADVANCED_NOREF</td>
<td>Advanced deinterlacing mode without using of reference frames.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_ADVANCED_SCD</td>
<td>Advanced deinterlacing mode with scene change detection.</td>
</tr>
<tr>
<td>MFX_DEINTERLACING_FIELD_WEAVING</td>
<td>Field weaving.</td>
</tr>
</tbody>
</table>

Change History

This enumerator is available since SDK API 1.13.

The SDK 1.17 adds **MFX_DEINTERLACING_ADVANCED_NOREF**.

The SDK 1.19 adds **MFX_DEINTERLACING_ADVANCED_SCD, MFX_DEINTERLACING_FIELD_WEAVING**.

TelecinePattern

Description

The **TelecinePattern** enumerator itemizes telecine patterns.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_TELECINE_PATTERN_32</td>
<td>3:2 telecine</td>
</tr>
<tr>
<td>MFX_TELECINE_PATTERN_2332</td>
<td>2:3:3:2 telecine</td>
</tr>
<tr>
<td>MFX_TELECINE_PATTERN_FRAME_REPEAT</td>
<td>One frame repeat telecine</td>
</tr>
<tr>
<td>MFX_TELECINE_PATTERN_41</td>
<td>4:1 telecine</td>
</tr>
<tr>
<td>MFX_TELECINE_POSITION_PROVIDED</td>
<td>User must provide position inside a sequence of 5 frames where the artifacts start.</td>
</tr>
</tbody>
</table>
**HEVCRegionType**  
**Description**  
The `HEVCRegionType` enumerator itemizes type of HEVC region.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_HEVC_REGION_SLICE</td>
</tr>
</tbody>
</table>

**GPUCopy**  
**Description**  
The `GPUCopy` enumerator controls usage of GPU accelerated copying between video and system memory in the SDK components.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_GPUCOPY_DEFAULT</td>
</tr>
<tr>
<td>MFX_GPUCOPY_ON</td>
</tr>
<tr>
<td>MFX_GPUCOPY_OFF</td>
</tr>
</tbody>
</table>

**WeightedPred**  
**Description**  
The `WeightedPred` enumerator itemizes weighted prediction modes.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_WEIGHTED_PRED_UNKNOWN</td>
</tr>
<tr>
<td>MFX_WEIGHTED_PRED_DEFAULT</td>
</tr>
<tr>
<td>MFX_WEIGHTED_PRED_EXPLICIT</td>
</tr>
<tr>
<td>MFX_WEIGHTED_PRED_IMPLICIT</td>
</tr>
</tbody>
</table>

**ScenarioInfo**  
**Description**  
The `ScenarioInfo` enumerator itemizes scenarios for the encoding session.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_SCENARIO_UNKNOWN, MFX_SCENARIO_DISPLAY_REMOTING, MFX_SCENARIO_VIDEO_CONFERENCE, MFX_SCENARIO_ARCHIVE, MFX_SCENARIO_LIVE_STREAMING, MFX_SCENARIO_CAMERA_CAPTURE</td>
</tr>
</tbody>
</table>

**ContentInfo**  
**Description**  
The `ContentInfo` enumerator itemizes content types for the encoding session.

<table>
<thead>
<tr>
<th>Name/Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CONTENT_UNKNOWN, MFX_CONTENT_FULL_SCREEN_VIDEO, MFX_CONTENT_NON_VIDEO_SCREEN</td>
</tr>
</tbody>
</table>
**Change History**

This enumerator is available since SDK API 1.16.

**PRefType**

**Description**

The `PRefType` enumerator itemizes models of reference list construction and DPB management when `GopRefDist=1`.

**Name/Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_P_REF_DEFAULT</td>
<td>Allow encoder to decide.</td>
</tr>
<tr>
<td>MFX_P_REF_SIMPLE</td>
<td>Regular sliding window used for DPB removal process.</td>
</tr>
<tr>
<td>MFX_P_REF_PYRAMID</td>
<td>Let N be the max reference list's size. Encoder treat each N's frame as &quot;strong&quot; reference and the others as &quot;weak&quot; references. Encoder uses &quot;weak&quot; reference only for prediction of the next frame and removes it from DPB right after. &quot;Strong&quot; references removed from DPB by sliding window.</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.16.

**GeneralConstraintFlags**

**Description**

The `GeneralConstraintFlags` enumerator uses bit-ORed values to itemize HEVC bitstream indications for specific profiles.

**Name/Description**

- MFX_HEVC_CONSTR_REXT_MAX_12BIT
- MFX_HEVC_CONSTR_REXT_MAX_10BIT
- MFX_HEVC_CONSTR_REXT_MAX_8BIT
- MFX_HEVC_CONSTR_REXT_MAX_422CHROMA
- MFX_HEVC_CONSTR_REXT_MAX_420CHROMA
- MFX_HEVC_CONSTR_REXT_MAX_MONOCHROME
- MFX_HEVC_CONSTR_REXT_INTRAR
- MFX_HEVC_CONSTR_REXT_ONE_PICTURE_ONLY
- MFX_HEVC_CONSTR_REXT_LOWER_BIT_RATE

Indications for format range extensions profiles.

**Change History**

This enumerator is available since SDK API 1.16.

**Angle**

**Description**

The `Angle` enumerator itemizes valid rotation angles.

**Name/Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ANGLE_0</td>
<td>0°</td>
</tr>
<tr>
<td>MFX_ANGLE_90</td>
<td>90°</td>
</tr>
<tr>
<td>MFX_ANGLE_180</td>
<td>180°</td>
</tr>
<tr>
<td>MFX_ANGLE_270</td>
<td>270°</td>
</tr>
</tbody>
</table>

**Change History**

This enumerator is available since SDK API 1.16.

**PlatformCodeName**

**Description**

The `PlatformCodeName` enumerator itemizes Intel® processor microarchitecture codenames. For details about any particular codename, see [ark.intel.com](http://ark.intel.com).

**Name/Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PLATFORM_UNKNOWN</td>
<td>Unknown platform</td>
</tr>
<tr>
<td>MFX_PLATFORM_SANDYBRIDGE</td>
<td>Sandy Bridge</td>
</tr>
<tr>
<td>MFX_PLATFORM_IVYBRIDGE</td>
<td>Ivy Bridge</td>
</tr>
<tr>
<td>MFX_PLATFORM_HASWELL</td>
<td>Haswell</td>
</tr>
</tbody>
</table>
### PayloadCtrlFlags

**Description**
The `PayloadCtrlFlags` enumerator itemizes additional payload properties.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_PAYLOAD_CTRL_SUFFIX</td>
<td>Insert this payload into HEVC Suffix SEI NAL-unit.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.19.

### IntraRefreshTypes

**Description**
The `IntraRefreshTypes` enumerator itemizes types of intra refresh.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_REFRESH_NO</td>
<td>Encode without refresh.</td>
</tr>
<tr>
<td>MFX_REFRESH_VERTICAL</td>
<td>Vertical refresh, by column of MBs.</td>
</tr>
<tr>
<td>MFX_REFRESH_HORIZONTAL</td>
<td>Horizontal refresh, by rows of MBs.</td>
</tr>
<tr>
<td>MFX_REFRESH_SLICE</td>
<td>Horizontal refresh by slices without overlapping.</td>
</tr>
</tbody>
</table>

**Change History**
Thisenumerator is available since SDK API 1.23.

### VP9ReferenceFrame

**Description**
The `VP9ReferenceFrame` enumerator itemizes reference frame type by `mfxVP9SegmentParam::ReferenceFrame` parameter.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_VP9_REF_INTRA</td>
<td>Intra</td>
</tr>
<tr>
<td>MFX_VP9_REF_LAST</td>
<td>Last</td>
</tr>
<tr>
<td>MFX_VP9_REF_GOLDEN</td>
<td>Golden</td>
</tr>
<tr>
<td>MFX_VP9_REF_ALTREF</td>
<td>Alternative reference</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.26.

### SegmentIdBlockSize

**Description**
The `SegmentIdBlockSize` enumerator indicates the block size represented by each segment_id in segmentation map. These values are used with the `mfxExtVP9Segmentation::SegmentIdBlockSize` parameter.

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### SegmentFeature

**Description**
The `SegmentFeature` enumerator indicates features enabled for the segment. These values are used with the `mfxVP9SegmentParam::FeatureEnabled` parameter.

**Name/Description**
- **MFX_VP9_SEGMENT_FEATURE_QINDEX**: Quantization index delta
- **MFX_VP9_SEGMENT_FEATURE_LOOP_FILTER**: Loop filter level delta
- **MFX_VP9_SEGMENT_FEATURE_REFERENCE**: Reference frame
- **MFX_VP9_SEGMENT_FEATURE_SKIP**: Skip

**Change History**
This enumerator is available since SDK API 1.26.

### InsertHDRPayload

**Description**
The `InsertHDRPayload` enumerator itemizes HDR payloads insertion rules.

**Name/Description**
- **MFX_PAYLOAD_OFF**: Don't insert payload
- **MFX_PAYLOAD_IDR**: Insert payload on IDR frames

**Change History**
This enumerator is available since SDK API 1.25.

### SampleAdaptiveOffset

**Description**
The `SampleAdaptiveOffset` enumerator uses bit-ORed values to itemize corresponding HEVC encoding feature.

**Name/Description**
- **MFX_SAO_UNKNOWN**: Use default value for platform/TargetUsage.
- **MFX_SAO_DISABLE**: Disable SAO. If set during `Init` leads to SPS `sample_adaptive_offset_enabled_flag = 0`. If set during `Runtime`, leads to `slice_sao_luma_flag = 0` and `slice_sao_chroma_flag = 0` for current frame.
- **MFX_SAO_ENABLE_LUMA**: Enable SAO for luma (`slice_sao_luma_flag = 1`).
- **MFX_SAO_ENABLE_CHROMA**: Enable SAO for chroma (`slice_sao_chroma_flag = 1`).

**Change History**
This enumerator is available since SDK API 1.26.

### BRCStatus

**Description**
The `BRCStatus` enumerator itemizes instructions to the SDK encoder by `mfxExtBrc::Update`.

**Name/Description**
- **MFX_BRC_OK**: Coded frame size is acceptable, no further operations required, proceed to next frame
- **MFX_BRC_BIG_FRAME**: Coded frame is too big, recoding required
- **MFX_BRC_SMALL_FRAME**: Coded frame is too small, recoding required
- **MFX_BRC_PANIC_BIG_FRAME**: Coded frame is too big, no further recoding possible - skip frame
- **MFX_BRC_PANIC_SMALL_FRAME**: Coded frame is too small, no further recoding possible - required padding to `mfxBRCFrameStatus::MinFrameSize`
**Change History**
This enumerator is available since SDK API 1.24.

**MFMode**

**Description**
The MFMode enumerator defines multi-frame submission mode.

**Name/Description**

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_MF_DEFAULT</td>
<td>The SDK decides if multi-frame submission is enabled or disabled based on parameters, target encoder, platform, implementation, etc.</td>
</tr>
<tr>
<td>MFX_MF_DISABLED</td>
<td>Explicitly disables multi-frame submission.</td>
</tr>
<tr>
<td>MFX_MF_AUTO</td>
<td>The SDK controls multi-frame submission based on timeout management and decides amount of frames to be combined, by default timeout is calculated based on requirement to reach particular output rate equal to framerate.</td>
</tr>
<tr>
<td>MFX_MF_MANUAL</td>
<td>Application manages multi-frame submission, number of frames can be maximum for platform and decided by Application. The SDK will always wait for mfxExtMultiFrameControl::MaxNumFrames to submit frames or until application specify mfxExtMultiFrameControl::Flush with one of frames</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.25.

**ErrorTypes**

**Description**
The ErrorTypes enumerator uses bit-ORed values to itemize bitstream error types.

**Name/Description**

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_ERROR_PPS</td>
<td>Invalid/corrupted PPS</td>
</tr>
<tr>
<td>MFX_ERROR_SPS</td>
<td>Invalid/corrupted SPS</td>
</tr>
<tr>
<td>MFX_ERROR_SLICEHEADER</td>
<td>Invalid/corrupted slice header</td>
</tr>
<tr>
<td>MFX_ERROR_SLICEDATA</td>
<td>Invalid/corrupted slice data</td>
</tr>
<tr>
<td>MFX_ERROR_FRAME_GAP</td>
<td>Missed frames</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.25.

**ChromaSiting**

**Description**
The ChromaSiting enumerator defines chroma location. Use bit-OR’ed values to specify the desired location.

**Name/Description**

<table>
<thead>
<tr>
<th>Name/Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFX_CHROMA_SITING_UNKNOWN</td>
<td>Unspecified.</td>
</tr>
<tr>
<td>MFX_CHROMA_SITING_VERTICAL_TOP</td>
<td>Chroma samples are co-sited vertically on the top with the luma samples.</td>
</tr>
<tr>
<td>MFX_CHROMA_SITING_VERTICAL_CENTER</td>
<td>Chroma samples are not co-sited vertically with the luma samples.</td>
</tr>
<tr>
<td>MFX_CHROMA_SITING_VERTICAL_BOTTOM</td>
<td>Chroma samples are co-sited vertically on the bottom with the luma samples.</td>
</tr>
<tr>
<td>MFX_CHROMA_SITING_HORIZONTAL_LEFT</td>
<td>Chroma samples are co-sited horizontally on the left with the luma samples.</td>
</tr>
<tr>
<td>MFX_CHROMA_SITING_HORIZONTAL_CENTER</td>
<td>Chroma samples are not co-sited horizontally with the luma samples.</td>
</tr>
</tbody>
</table>

**Change History**
This enumerator is available since SDK API 1.25.

**Appendices**

**Appendix A: Configuration Parameter Constraints**
The mfxFrameInfo structure is used by both the mfxVideoParam structure during SDK class initialization and the mfxFrameSurface1 structure during the actual SDK class function. The following constraints apply:

Constraints common for DECODE, ENCODE and VPP:
<table>
<thead>
<tr>
<th>Parameters</th>
<th>During SDK initialization</th>
<th>During SDK operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;constant&gt;</code></td>
<td>Any valid value</td>
<td>The value must be the same as the initialization value. The only exception is VPP in composition mode, where in some cases it is allowed to mix RGB and NV12 surfaces. See <strong>mfxExtVPPComposite</strong> for more details.</td>
</tr>
</tbody>
</table>

Constraints for **DECODE**:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>During SDK initialization</th>
<th>During SDK operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width, Height</td>
<td>Aligned frame size</td>
<td>The values must be the equal to or larger than the initialization values.</td>
</tr>
<tr>
<td>CropX, CropY, CropW, CropH</td>
<td>Ignored</td>
<td><strong>DECODE</strong> output. The cropping values are per-frame based.</td>
</tr>
<tr>
<td>AspectRatioW, AspectRatioH</td>
<td>Any valid values or unspecified (zero); if unspecified, values from the input bitstream will be used; see note below the table</td>
<td><strong>DECODE</strong> output.</td>
</tr>
<tr>
<td>FrameRateExtN, FrameRateExtD</td>
<td>Any valid values or unspecified (zero); if unspecified, values from the input bitstream will be used; see note below the table</td>
<td><strong>DECODE</strong> output.</td>
</tr>
<tr>
<td>PicStruct</td>
<td>Ignored</td>
<td><strong>DECODE</strong> output.</td>
</tr>
</tbody>
</table>

Note about priority of initialization parameters.

If application explicitly sets FrameRateExtN/FrameRateExtD or AspectRatioW/AspectRatioH during initialization then decoder uses these values during decoding regardless of values from bitstream and does not update them on new SPS. If application sets them to 0, then decoder uses values from stream and update them on each SPS.

Constraints for **VPP**:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>During SDK initialization</th>
<th>During SDK operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width, Height</td>
<td>Any valid values</td>
<td>These values must be the same or larger than the initialization values.</td>
</tr>
<tr>
<td>CropX, CropY, CropW, CropH</td>
<td>Ignored</td>
<td>These parameters specify the region of interest from input to output.</td>
</tr>
<tr>
<td>AspectRatioW, AspectRatioH</td>
<td>Ignored</td>
<td>Aspect ratio values will be passed through from input to output.</td>
</tr>
<tr>
<td>FrameRateExtN, FrameRateExtD</td>
<td>Any valid values</td>
<td>Frame rate values will be updated with the initialization value at output.</td>
</tr>
<tr>
<td>PicStruct</td>
<td><code>MFX_PICSTRUCT_UNKNOWN</code>, <code>MFX_PICSTRUCT_PROGRESSIVE</code>, <code>MFX_PICSTRUCT_FIELD_TFF</code>, <code>MFX_PICSTRUCT_FIELD_BFF</code>, <code>MFX_PICSTRUCT_FIELD_SINGLE</code>, <code>MFX_PICSTRUCT_FIELD_TOP</code>, <code>MFX_PICSTRUCT_FIELD_BOTTOM</code></td>
<td>The base value must be the same as the initialization value unless <code>MFX_PICSTRUCT_UNKNOWN</code> is specified during initialization. Other decorative picture structure flags are passed through or added as needed. See the <strong>PicStruct</strong> enumerator for details.</td>
</tr>
</tbody>
</table>

Constraints for **ENCODE**:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>During SDK initialization</th>
<th>During SDK operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width, Height</td>
<td>Encoded frame size</td>
<td>The values must be the same or larger than the initialization values.</td>
</tr>
<tr>
<td>CropX, CropY, CropW, CropH</td>
<td>H.264: Cropped frame size MPEG-2: <code>CropW</code> and <code>CropH</code> specify the real width and height (maybe unaligned) of the coded frames. <code>CropX</code> and <code>CropY</code> must be zero.</td>
<td>Ignored</td>
</tr>
<tr>
<td>AspectRatioW, AspectRatioH</td>
<td>Any valid values</td>
<td>Ignored</td>
</tr>
<tr>
<td>FrameRateExtN, FrameRateExtD</td>
<td>Any valid values</td>
<td>Ignored</td>
</tr>
<tr>
<td>PicStruct</td>
<td><code>MFX_PICSTRUCT_UNKNOWN</code>, <code>MFX_PICSTRUCT_PROGRESSIVE</code>, <code>MFX_PICSTRUCT_FIELD_TFF</code>, or <code>MFX_PICSTRUCT_FIELD_BFF</code></td>
<td>The base value must be the same as the initialization value unless <code>MFX_PICSTRUCT_UNKNOWN</code> is specified during initialization. Add other decorative picture structure flags to indicate additional display attributes. Use <code>MFX_PICSTRUCT_UNKNOWN</code> during initialization for field attributes and <code>MFX_PICSTRUCT_PROGRESSIVE</code> for frame attributes. See the <strong>PicStruct</strong> enumerator for details.</td>
</tr>
</tbody>
</table>
The following table summarizes how to specify the configuration parameters during initialization and during encoding, decoding and video processing:

<table>
<thead>
<tr>
<th></th>

*Note: CodecProfile is mandated for HEVC REXT and SCC profiles and optional for other cases. If application doesn't explicitly set CodecProfile during initialization, HEVC decoder will use profile up to Main10.*

### Appendix B: Multiple-Segment Encoding

Multiple-segment encoding is useful in video editing applications when during production; the encoder encodes multiple video clips according to their time line. In general, one can define multiple-segment encoding as dividing an input sequence of frames into segments and encoding them in different encoding sessions with the same or different parameter sets, as illustrated in Figure 7. (Note that different encoders can also be used.)

The application must be able to:

- Extract encoding parameters from the bitstream of previously encoded segment;
- Import these encoding parameters to configure the encoder.
Encoding can then continue on the current segment using either the same or the similar encoding parameters.

**Figure 7: Multiple-Segment Encoding**

<table>
<thead>
<tr>
<th>Segment already encoded</th>
<th>Segment in encoding</th>
<th>Segment to be encoded</th>
</tr>
</thead>
<tbody>
<tr>
<td>0s</td>
<td>200s</td>
<td>500s</td>
</tr>
</tbody>
</table>

Extracting the header containing the encoding parameter set from the encoded bitstream is usually the task of a format splitter (de-multiplexer). Nevertheless, the SDK `MFXVideoDECODE_DecodeHeader` function can export the raw header if the application attaches the `mfxExtCodingOptionSPSPPS` structure as part of the parameters.

The encoder can use the `mfxExtCodingOptionSPSPPS` structure to import the encoding parameters during `MFXVideoENCODE_Init`. The encoding parameters are in the encoded bitstream format. Upon a successful import of the header parameters, the encoder will generate bitstreams with a compatible (not necessarily bit-exact) header. Table 9 shows all functions that can import a header and their error codes if there are unsupported parameters in the header or the encoder is unable to achieve compatibility with the imported header.

**Table 9: Multiple-Segment Encoding Functions**

<table>
<thead>
<tr>
<th>Function Name</th>

</tr>
</tbody>
</table>

The encoder must encode frames to a GOP sequence starting with an IDR frame for H.264 (or I frame for MPEG-2) to ensure that the current segment encoding does not refer to any frames in the previous segment. This ensures that the encoded segment is self-contained, allowing the application to insert it anywhere in the final bitstream. After encoding, each encoded segment is HRD compliant. However, the concatenated segments may not be HRD compliant.

Example 16 shows an example of the encoder initialization procedure that imports H.264 sequence and picture parameter sets.

**Example 16: Pseudo-code to Import H.264 SPS/PPS Parameters**

```c
mfxStatus init_encoder(...) {
    mfxExtCodingOptionSPSPPS option, *option_array;

    /* configure mfxExtCodingOptionSPSPPS */
    memset(&option, 0, sizeof(option));
    option.Header.BufferId=MFX_EXTBUFF_CODING_OPTION_SPSPPS;
    option.Header.BufferSz=sizeof(option);
    option.SPSBuffer=sps_buffer;
    option.SPSBufSize=sps_buffer_length;
    option.PPSBuffer=pps_buffer;
    option.PPSBufSize=pps_buffer_length;

    /* configure mfxVideoParam */
    mfxVideoParam param;
    ...
    param.NumExtParam=1;
    option_array=&option;
    param.ExtParam=&option_array;

    /* encoder initialization */
    mfxStatus status;
    status=MFXVideoENCODE_Init(session, &param);
    if (status==MFX_ERR_INCOMPATIBLE_VIDEO_PARAM) {
        printf("Initialization failed\n");
    } else {
        printf("Initialized\n");
    }
    return status;
}
```

**Appendix C: Streaming and Video Conferencing Features**

The following sections address a few aspects of additional requirements that streaming or video conferencing applications may use in the encoding or transcoding process. See also Configuration Change chapter.

**Dynamic Bitrate Change**

The SDK encoder supports dynamic bitrate change differently depending on bitrate control mode and HRD conformance requirement. If HRD conformance is required, i.e. if application sets `NalHrdConformance` option in `mfxExtCodingOption` structure to ON, the only allowed bitrate control mode is VBR. In this mode, the application can change `TargetKbps` and `MaxKbps` values. The application can change these values by calling the `MFXVideoENCODE_Reset` function. Such change in bitrate usually results in generation of a new key-frame and
sequence header. There are some exceptions though. For example, if HRD Information is absent in the stream then change of TargetKbps does not require change of sequence header and as a result the SDK encoder does not insert a key frame.

If HRD conformance is not required, i.e. if application turns off NalHrdConformance option in mfxExtCodingOption structure, all bitrate control modes are available. In CBR and AVBR modes the application can change TargetKbps, in VBR mode the application can change TargetKbps and MaxKbps values. Such change in bitrate will not result in generation of a new key-frame or sequence header.

The SDK encoder may change some of the initialization parameters provided by the application during initialization. That in turn may lead to incompatibility between the parameters provided by the application during reset and working set of parameters used by the SDK encoder. That is why it is strongly recommended to retrieve the actual working parameters by MFXVideoENCODE_GetVideoParam function before making any changes to bitrate settings.

In all modes, the SDK encoders will respond to the bitrate changes as quickly as the underlying algorithm allows, without breaking other encoding restrictions, such as HRD compliance if it is enabled. How soon the actual bitrate can catch up with the specified bitrate is implementation dependent.

Alternatively, the application may use the CQP (constant quantization parameter) encoding mode to perform customized bitrate adjustment on a per-frame base. The application may use any of the encoded or display order modes to use per-frame CQP.

**Dynamic resolution change**

The SDK encoder supports dynamic resolution change in all bitrate control modes. The application may change resolution by calling MFXVideoENCODE_Reset function. The application may decrease or increase resolution up to the size specified during encoder initialization.

Resolution change always results in insertion of key IDR frame and new sequence parameter set header. The SDK encoder does not guarantee HRD conformance across resolution change point.

The SDK encoder may change some of the initialization parameters provided by the application during initialization. That in turn may lead to incompatibility of parameters provide by the application during reset and working set of parameters used by the SDK encoder. That is why it is strongly recommended to retrieve the actual working parameters set by MFXVideoENCODE_GetVideoParam function before making any resolution change.

**Forced Key Frame Generation**

The SDK supports forced key frame generation during encoding. The application can set the FrameType parameter of the mfxEncodeCtrl structure to control how the current frame is encoded, as follows:

- If the SDK encoder works in the display order, the application can enforce any current frame to be a key frame. The application cannot change the frame type of already buffered frames inside the SDK encoder.
- If the SDK encoder works in the encoded order, the application must exactly specify frame type for every frame thus the application can enforce the current frame to have any frame type that particular coding standard allows.

**Reference List Selection**

During streaming or video conferencing, if the application can obtain feedbacks about how good the client receives certain frames, the application may need to adjust the encoding process to use or not use certain frames as reference. The following paragraphs describe how to fine-tune the encoding process based on such feedbacks.

The application can specify the reference window size by specifying the parameter mfxInfoMFX::NumRefFrame during encoding initialization. Certain platform may have limitation on how big the size of the reference window is. Use the function MFXVideoENCODE_GetVideoParam to retrieve the current working set of parameters.

During encoding, the application can specify the actual reference list lengths by attaching the mfxExtAVCRefListCtrl structure to the MFXVideoENCODE_EncodeFrameAsync function. The NumRefIdxL0Active parameter of the mfxExtAVCRefListCtrl structure specifies the length of the reference list L0 and the NumRefIdxL1Active parameter specifies the length of the reference list L1. These two numbers must be less or equal to the parameter mfxInfoMFX::NumRefFrame during encoding initialization.

The application can instruct the SDK encoder to use or not use certain reference frames. To do this, there is a prerequisite that the application must uniquely identify each input frame, by setting the mfxFrameData::FrameOrder parameter. The application then specifies the preferred reference frame list PreferredRefList and/or the rejected frame list RejectedRefList in the mfxExtAVCRefListCtrl structure, and attach the structure to the MFXVideoENCODE_EncodeFrameAsync function. The two lists fine-tune how the SDK encoder chooses the reference frames of the current frame. The SDK encoder does not keep PreferredRefList and application has to send it for each frame if necessary. There are a few limitations:

- The frames in the lists are ignored if they are out of the reference window.
- If by going through the lists, the SDK encoder cannot find a reference frame for the current frame, the SDK encoder will encode the current frame without using any reference frames.
- If the GOP pattern contains B-frames, the SDK encoder may not be able to follow the mfxExtAVCRefListCtrl instructions.
Low Latency Encoding and Decoding

The application can set `mfxVideoParam::AsyncDepth=1` to disable any decoder buffering of output frames, which is aimed to improve the transcoding throughput. With `AsyncDepth=1`, the application must synchronize after the decoding or transcoding operation of each frame.

The application can adjust `mfxExtCodingOption::MaxDecFrameBuffering`, during encoding initialization, to improve decoding latency. It is recommended to set this value equal to number of reference frames.

Reference Picture Marking Repetition SEI message

The application can request writing the reference picture marking repetition SEI message during encoding initialization, by setting the `RefPicMarkRep` flag in the `mfxExtCodingOption` structure. The reference picture marking repetition SEI message repeats certain reference frame information in the output bitstream for robust streaming.

The SDK decoder will respond to the reference picture marking repetition SEI message if such message exists in the bitstream, and check with the reference list information specified in the sequence/picture headers. The decoder will report any mismatch of the SEI message with the reference list information in the `mfxFrameData::Corrupted` field.

Long-term Reference frame

The application may use long-term reference frames to improve coding efficiency or robustness for video conferencing applications. The application controls the long-term frame marking process by attaching the `mfxExtAVCRefListCtrl` extended buffer during encoding. The SDK encoder itself never marks frame as long-term.

There are two control lists in the `mfxExtAVCRefListCtrl` extended buffer. The `LongTermRefList` list contains the frame orders (the `FrameOrder` value in the `mfxFrameData` structure) of the frames that should be marked as long-term frames. The `RejectedRefList` list contains the frame order of the frames that should be unmarked as long-term frames. The application can only mark/unmark those frames that are buffered inside encoder. Because of this, it is recommended that the application marks a frame when it is submitted for encoding. Application can either explicitly unmark long-term reference frame or wait for IDR frame, then all long-term reference frames will be unmarked.

The SDK encoder puts all long-term reference frames at the end of a reference frame list. If the number of active reference frames (the `NumRefIdxL0Active` and `NumRefIdxL1Active` values in the `mfxExtAVCRefListCtrl` extended buffer) is smaller than the total reference frame number (the `NumRefFrame` value in the `mfxInfoMFX` structure during the encoding initialization), the SDK encoder may ignore some or all long-term reference frames. The application may avoid this by providing list of preferred reference frames in the `PreferredRefList` list in the `mfxExtAVCRefListCtrl` extended buffer. In this case, the SDK encoder reorders the reference list based on the specified list.

Temporal scalability

The application may specify the temporal hierarchy of frames by using the `mfxExtAvcTemporalLayers` extended buffer during the encoder initialization, in the display-order encoding mode. The SDK inserts the prefix NAL unit before each slice with a unique temporal and priority ID. The temporal ID starts from zero and the priority ID starts from the `BaseLayerPID` value. The SDK increases the temporal ID and priority ID value by one for each consecutive layer.

If the application needs to specify a unique sequence or picture parameter set ID, the application must use the `mfxExtCodingOptionSPSPPS` extended buffer, with all pointers and sizes set to zero and valid `SPSId/PPSId` fields. The same SPS and PPS ID will be used for all temporal layers.

Each temporal layer is a set of frames with the same temporal ID. Each layer is defined by the `Scale` value. `Scale` for layer N is equal to ratio between the frame rate of subsequence consisted of temporal layers with temporal ID lower or equal to N and frame rate of base temporal layer. The application may skip some of the temporal layers by specifying the `Scale` value as zero. The application should use an integer ratio of the frame rates for two consecutive temporal layers.

For example, 30 frame per second video sequence typically is separated by three temporal layers, that can be decoded as 7.5 fps (base layer), 15 fps (base and first temporal layer) and 30 fps (all three layers). `Scale` for this case should have next values \{1,2,4,0,0,0,0,0\}.

Appendix D: Switchable Graphics and Multiple Monitors

The following sections address a few aspects of supporting switchable graphics and multiple monitors configurations.

Switchable Graphics

Switchable Graphics refers to the machine configuration that multiple graphic devices are available (integrated device for power saving and discrete devices for performance.) Usually at one time or instance, one of the graphic devices drives display and becomes the active device, and others become inactive. There are different variations of software or hardware mechanisms to switch between the graphic devices. In one of the switchable graphics variations, it is possible to register an application in an affinity list to certain graphic device so that the launch of the application automatically triggers a switch. The actual techniques to enable such a switch are outside the scope
of this document. This document discusses the implication of switchable graphics to the SDK and the SDK applications.

As the SDK performs hardware acceleration through Intel graphic device, it is critical that the SDK can access to the Intel graphic device in the switchable graphics setting. If possible, it is recommended to add the application to the Intel graphic device affinity list. Otherwise, the application must handle the following cases:

1. By the SDK design, during the SDK library initialization, the function `MFXInit` searches for Intel graphic devices. If a SDK implementation is successfully loaded, the function `MFXInit` returns `MFX_ERR_NONE` and the `MFXQueryIMPL` function returns the actual implementation type. If no SDK implementation is loaded, the function `MFXInit` returns `MFX_ERR_UNSUPPORTED`. In the switchable graphics environment, if the application is not in the Intel graphic device affinity list, it is possible that the Intel graphic device is not accessible during the SDK library initialization. The fact that the `MFXInit` function returns `MFX_ERR_UNSUPPORTED` does not mean that hardware acceleration is not possible permanently. The user may switch the graphics later and by then the Intel graphic device will become accessible. It is recommended that the application initialize the SDK library right before the actual decoding, video processing, and encoding operations to determine the hardware acceleration capability.

2. During decoding, video processing, and encoding operations, if the application is not in the Intel graphic device affinity list, the previously accessible Intel graphic device may become inaccessible due to a switch event. The SDK functions will return `MFX_ERR_DEVICE_LOST` or `MFX_ERR_DEVICE_FAILED`, depending on when the switch occurs and what stage the SDK functions operate. The application needs to handle these errors and exits gracefully.

### Multiple Monitors

Multiple monitors refer to the machine configuration that multiple graphic devices are available. Some of the graphic devices connect to a display, they become active and accessible under the Microsoft® DirectX® infrastructure. For those graphic devices not connected to a display, they are inactive. Specifically, under the Microsoft Direct3D® infrastructure, those devices are not accessible.

The SDK uses the adapter number to access to a specific graphic device. Usually, the graphic device that drives the main desktop becomes the primary adapter. Other graphic devices take subsequent adapter numbers after the primary adapter. Under the Microsoft Direct3D® infrastructure, only active adapters are accessible and thus have an adapter number.

The SDK extends the implementation type `mfxIMPL` as follows:

<table>
<thead>
<tr>
<th>Implementation Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MFX_IMPL_HARDWARE</code></td>
<td>The SDK should initialize on the primary adapter</td>
</tr>
<tr>
<td><code>MFX_IMPL_HARDWARE2</code></td>
<td>The SDK should initialize on the 2nd graphic adapter</td>
</tr>
<tr>
<td><code>MFX_IMPL_HARDWARE3</code></td>
<td>The SDK should initialize on the 3rd graphic adapter</td>
</tr>
<tr>
<td><code>MFX_IMPL_HARDWARE4</code></td>
<td>The SDK should initialize on the 4th graphic adapter</td>
</tr>
</tbody>
</table>

The application can use the above definitions to instruct the SDK library to initializes on a specific graphic device. The application can also use the following definitions for automatic detection:

<table>
<thead>
<tr>
<th>Implementation Type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MFX_IMPL_HARDWARE_ANY</code></td>
<td>The SDK should initialize on any graphic adapter</td>
</tr>
<tr>
<td><code>MFX_IMPL_AUTO_ANY</code></td>
<td>The SDK should initialize on any graphic adapter. If not successful, load the software implementation.</td>
</tr>
</tbody>
</table>

If the application uses the Microsoft® DirectX® surfaces for I/O, it is critical that the application and the SDK works on the same graphic device. It is recommended that the application use the following procedure:

- The application uses the `MFXInit` function to initialize the SDK library, with option `MFX_IMPL_HARDWARE_ANY` or `MFX_IMPL_AUTO_ANY`. The `MFXInit` function returns `MFX_ERR_NONE` if successful.
- The application uses the `MFXQueryIMPL` function to check the actual implementation type. The implementation type `MFX_IMPL_HARDWARE...MFX_IMPL_HARDWARE4` indicates the graphic adapter the SDK works on.
- The application creates the Direct3D® device on the respective graphic adapter, and passes it to the SDK through the `MFXVideoCORE_SetHandle` function.

Finally, similar to the switchable graphics cases, it is possible that the user disconnects monitors from the graphic devices or remaps the primary adapter thus causes interruption. If the interruption occurs during the SDK library initialization, the `MFXInit` function may return `MFX_ERR_UNSUPPORTED`. This means hardware acceleration is currently not available. It is recommended that the application initialize the SDK library right before the actual decoding, video processing, and encoding operations to determine the hardware acceleration capability.

If the interruption occurs during decoding, video processing, or encoding operations, the SDK functions will return `MFX_ERR_DEVICE_LOST` or `MFX_ERR_DEVICE_FAILED`. The application needs to handle these errors and exit gracefully.

### Appendix E: Working directly with VA API for Linux*

The SDK takes care of all memory and synchronization related operations in VA API. However, in some cases the
application may need to extend the SDK functionality by working directly with VA API for Linux*. For example, to implement customized external allocator or USER functions (also known as "plug-in"). This chapter describes some basic memory management and synchronization techniques.

To create VA surface pool the application should call vaCreateSurfaces as it is shown in Example 17.

**Example 17: Creation of VA surfaces**

```c
VASurfaceAttrib attrib;
attrib.type = VASurfaceAttribPixelFormat;
attrib.value.type = VAGenericValueTypeInteger;
attrib.value.value.i = VA_FOURCC_NV12;
attrib.flags = VA_SURFACE_ATTRIB_SETTABLE;

#define NUM_SURFACES 5;
VASurfaceID surfaces[NUM_SURFACES];

vaCreateSurfaces(va_display, VA_RT_FORMAT_YUV420,
width, height,
surfaces, NUM_SURFACES,
&attrib, 1);
```

To destroy surface pool the application should call vaDestroySurfaces as it is shown in Example 18.

**Example 18: Destroying of VA surfaces**

```c
vaDestroySurfaces(va_display, surfaces, NUM_SURFACES);
```

If the application works with hardware acceleration through the SDK then it can access surface data immediately after successful completion of MFXVideoCORE_SyncOperation call. If the application works with hardware acceleration directly then it has to check surface status before accessing data in video memory. This check can be done asynchronously by calling vaQuerySurfaceStatus function or synchronously by vaSyncSurface function.

After successful synchronization the application can access surface data. It is performed in two steps. At the first step VAImage is created from surface and at the second step image buffer is mapped to system memory. After mapping VAImage.offsets[3] array holds offsets to each color plain in mapped buffer and VAImage.pitches[3] array holds color plain pitches, in bytes. For packed data formats, only first entries in these arrays are valid. Example 19 shows how to access data in NV12 surface.

**Example 19: Accessing data in VA surface**

```c
VAImage image;
unsigned char *buffer, Y, U, V;
vaDeriveImage(va_display, surface_id, &image);
vaMapBuffer(va_display, image.buf, &buffer);

Y = buffer + image.offsets[0];
U = buffer + image.offsets[1];
V = U + 1;
```

After processing data in VA surface the application should release resources allocated for mapped buffer and VAImage object. Example 20 shows how to do it.

**Example 20: unmapping buffer and destroying VAImage**

```c
vaUnmapBuffer(va_display, image.buf);
vaDestroyImage(va_display, image.image_id);
```

In some cases, for example, to retrieve encoded bitstream from video memory, the application has to use VABuffer to store data. Example 21 shows how to create, use and then destroy VA buffer. Note, that vaMapBuffer function returns pointers to different objects depending on mapped buffer type. It is plain data buffer for VAImage and VACodedBufferSegment structure for encoded bitstream. The application cannot use VABuffer for synchronization and in case of encoding it is recommended to synchronize by input VA surface as described above.

**Example 21: Working with encoded bitstream buffer**
Appendix F: CQP HRD mode encoding

Application can configure AVC encoder to work in CQP rate control mode with HRD model parameters. SDK will place HRD information to SPS/VUI and choose appropriate profile/level. It’s responsibility of application to provide per-frame QP, track HRD conformance and insert required SEI messages to the bitstream.

Example 22 shows how to enable CQP HRD mode. Application should set RateControlMethod to CQP, VuiNalHrdParameters to ON, NalHrdConformance to OFF and set rate control parameters similar to CBR or VBR modes (instead of QPI, QPP and QPB). SDK will choose CBR or VBR HRD mode based on MaxKbps parameter. If MaxKbps is set to zero, SDK will use CBR HRD model (write cbr_flag = 1 to VUI), otherwise VBR model will be used (and cbr_flag = 0 is written to VUI).

Example 22: Pseudo-code to enable CQP HRD mode
mfxExtCodingOption option, *option_array;

/* configure mfxExtCodingOption */
memset(&option, 0, sizeof(option));
option.Header.BufferId = MFX_EXTBUFF_CODING_OPTION;
option.Header.BufferSz = sizeof(option);
option.VuiNalHrdParameters = MFX_CODINGOPTION_ON;
option.NalHrdConformance = MFX_CODINGOPTION_OFF;

/* configure mfxVideoParam */
mfxVideoParam param;
...

param.mfx.RateControlMethod = MFX_RATECONTROL_CQP;
param.mfx.FrameInfo.FrameRateExtN = <valid_non_zero_value>;
param.mfx.FrameInfo.FrameRateExtD = <valid_non_zero_value>;
param.mfx BufferSizeInKB = <valid_non_zero_value>;
param.mfx.InitialDelayInKB = <valid_non_zero_value>;
param.mfx.TargetKbps = <valid_non_zero_value>;

if (<write cbr_flag = 1>)
    param.mfx.MaxKbps = 0;
else /* <write cbr_flag = 0> */
    param.mfx.MaxKbps = <valid_non_zero_value>;

param.NumExtParam = 1;
option_array = &option;
param.ExtParam = &option_array;

/* encoder initialization */
mfxStatus sts;
sts = MFXVideoENCODE_Init(session, &param);
...

/* encoding */
mfxEncodeCtrl ctrl;
memset(&ctrl, 0, sizeof(ctrl));
ctrl.QP = <frame_qp>
sts = MFXVideoENCODE_EncodeFrameAsync(session, &ctrl, surface2, bits, &syncp);
...
